THE ORIGINAL "LAWRIE TODD".

MUSEUM

OF

Foreign Literature, Science, and Art.

From Fraser's Magazine.

GRANT THORBURN,

THE ORIGINAL "LAWRIE TODD."

Our well-informed readers do not require to be told, that upwards of thirteen thousand nine hundred and ninety-nine regular subscribers to any monthly work is an acquisition not to be attained without great assiduity, and, we may add, some talent. We shall not, however, descant on our own laudable endeavours; although the portrait which faces this article of the celebrated Mr. Thorburn, the original "Lawrie Todd," bears witness that they are of no ordinary kind.

As soon as our number with the autobiography of this eminent gentleman reached America, the whole republic was set astir, as if the election of the president was contested. Mr. Thorburn was obliged to forego the weighing of seeds, the feeding of birds, and the culling of flowers: in short, to do nothing all day but to state to the ladies and gentlemen who resorted to his store, the reasons which had hitherto prevented him from visiting London, with his precious manuscript of the instances of special providence which he himself had experienced. Indeed, the crowd became so great to hear him, that he was obliged to ascend into one of his galleries; and there, mounting on a barrel-head, by which he became visible to the crowd below, to hold forth on the subject.

All, however, that he could urge was of no avail; the ladies and gentlemen, assembled on the occasion, highly applauded, no doubt, his eloquent speech; but they could not listen to his argument. "London," they said, "was the mart of the mind; and though it was becoming his innate modesty to profess his contentation at the great *eclat* he had attained, still they thought that the candle of so rare a genius should not be hidden under such a bushel as New York." Accordingly, his blushes and diffidence were overcome, and he was constrained to come over the sea; and here he is, his likeness illuminating the pages of REGINA, and his person irradiating the streets and social parties of London—the press is big with his important work, and the day of the deliverance of which is at hand—as may be seen by the following advertisement, published verbatim in all the London daily papers:

"TO THE PUBLIC.

"As Mr. John Galt in his *Lawrie Todd*, and sundrie other Periodicals, Magazines, Newspapers, &c. in Europe and America, have published so many *Scraps* and *Fragments* of my Life, I think its a duty I owe the Public and myself to send forth a true Copie.—I think the events of my Life are more strange in realitie, than many which I have read in fiction, and as I owe the giver of all good a large debt of gratitude, I think its my dutie to make sure that the world shall know it,—will be published in a few days by Mr. James Fraser, No. 215, Regent Street, which is the only true history of my Life ever printed in Britain.

(Signed) "Grant Thorburn, Seedsman, New York.

"Now at No. 14, Tavistock Row, Covent Garden,
16 Novr. 1833."

It is not, however, so much by this announcement that the curiosity of our numerous particular readers, nor that of the public in general, ought to be excited, as by the nature of the book itself. For of late it has not been quite so much the fashion as it ought to have been, for literary men to acknowledge their experiences of a special providence; although it cannot be supposed that the teachers of the earth are less sensible of its aid than the rest of the human race. We therefore solicit attention to this great feature of the forthcoming volume; convinced that it will not only afford amusement in the perusal, but edification in that somewhat obsolete manner which our ancestors, with all their often-referred-to wisdom, deemed not unbecoming to feel and to confess. To be serious, Mr. Thorburn's book, written entirely by himself, will be no ordinary treat to those who discern the hand of Sustaining Succour in the various vicissitudes of private life, as well as in the more obstreperous transactions of the world, and humbly recognise that Impartial Power which beholds alike, unmoved from its purposes,

"A hero perish and a sparrow fall."

From the New Monthly Magazine

REVOLUTIONS OF THE NINETEENTH CENTURY.

The title of this paper may lead the reader to imagine that it is political—it is not—at least not exclusively. Its object is to bring before the eye a brief review of the wonderful change which has taken place in governments, institutions, manners, arts, sciences, and manufactures, since the year 1800. The result of such a review, in itself by no means uninteresting, will be, in our opinion, a conviction that never was so much done, in the same space of time since the world began, especially as those revolutions more particularly relate to, and affect Britain and British society.

Before we bring this enquiry to bear directly upon our own circumstances, and the position of

our own country in the scale of European nations, it may be necessary to take a cursory view of other states, and the alterations which their characters and constitutions have undergone during the last thirty-four years.

In France, at the commencement of the century, there existed a consular government,—Buonaparte being first consul—a government raised upon the ruins of a sad and memorable revolution; in 1802, Buonaparte became consul for life; in 1804, Emperor; in 1808, he deprived the pope, who crowned him, of his territories; in 1809, he divorced his wife; in 1810, he married Marie Louise. Between the commencement of his career and its close, he created three kingdoms, Bavaria, Saxony, and Wirtemberg. He made his brother Joseph, king of Spain; his brother Louis, king of Holland; his brother Jerome, king of Westphalia; his brother-in-law Murat, king of Naples; and his son-in-law Eugene, viceroy of Italy.—Facts, astounding in themselves, not more strongly illustrative of the revolutions of the present century as connected with France and its emperor, than as exhibiting the *generality* of revolutions as to the other nations in which those family promotions were made.

Keeping our eye then upon France, we see in 1814 the exiled and denounced Bourbons restored to their throne—Russian cossacks bivouac in the Champs Elysées, and English soldiers mount guard at the Tuileries—Buonaparte is banished to Elba—his family are dethroned and degraded—from Elba he escapes, returns to Paris, is again in the ascendant; reigns for his Hundred Days, and then, by a series of victories, crowned and consummated by that of Waterloo, is beaten down never to rise again: unable to escape, he makes a merit of surrendering to England, and for the sake of peace in Europe, is sent to St. Helena, where he dies. On his departure, the Bourbons again succeed: Louis XVIII. dies at a good old age in his palace; and is succeeded by Charles X. The son of the Duc de Berri, murdered before his infant's birth, is heir presumptive to the throne—a new revolution breaks out—Charles X. abdicates—his ministers are tried and imprisoned for life—the throne is occupied by his nephew, as Citizen King of the French—the son of Buonaparte dies—the widow of the Duc de Berri is imprisoned—marries a second husband—has another child,—and France, altogether in the strictest alliance with England, her oldest and most inveterate enemy, is only kept from a revolution, by the unflinching severity of the "liberal" king, who was forced upon the throne by the last one. All these events have occurred during this century.

In Portugal, after the measures of the French had driven the prince regent and his family to the Brazils, the English rescued that country from French tyranny. In 1821, the king (as he had then become by the death of his father) returned to his throne; in 1820, his eldest son, Don Pedro, having formally dissolved the union between Brazil and Portugal, caused himself to be proclaimed Emperor of Brazil; Don John VI. died in 1826, when Don Pedro claimed the crown of Portugal for his daughter, Donna Maria; Don Miguel, second son of Don John, claimed the throne as the law of the land and the decree of Lamego warranted. In the meantime, a revolution occurred in Brazil, and the emperor took to flight—his son, a *child*, is now the emperor. The struggle between the brothers is too familiar to need a word of remark; the claim of Don Pedro for his daughter is at present successful, and Donna Maria, a *child*, occupies the Portuguese throne.

Spain, on the renewal of the war in 1803, was compelled by France to take active measures against England; in 1804, she declared war against us; in 1805, Nelson, with his heart's blood, bought us the glorious victory of Trafalgar, in which the Spanish fleet, combined with that of France, was destroyed; in 1808, Buonaparte threw off the mask as to Spanish affairs; Charles IV. abdicated, and Ferdinand VII. was proclaimed. At this period, Charles IV. having been induced to declare his abdication, a compulsory act, was also induced to throw himself for safety upon Buonaparte's kindness. Then it was that Buonaparte invited Ferdinand to come and meet him on his road to Madrid—the king was deceived and went—he arrived at Vittoria, where he was surrounded by French troops, and where he received a letter from Buonaparte, addressed him, *not as King*, but as Prince of Austrias, assuring him that he, Buonaparte, not only as *his* friend, but as the general protector and benefactor of Europe, was visiting Spain merely with a view to make such reforms as might be most agreeable to the popular feeling, and best tend to the pacification of the country.

Upon the receipt of this friendly communication Ferdinand continued his journey to Bayonne, where he dined with his illustrious friend and patron; and, after dinner, heard from his imperial host that he thought it good to fill the throne of Spain by placing one of his own brothers on it. Ferdinand found himself in fact a prisoner, and was shortly after compelled to renounce his crown at the desire of his father, expressed in the presence of Buonaparte himself, to whom that father had the day before sold his kingdom and his birth-right for a stipulated sum.

This compulsory step caused the patriotic revolution in Spain. Joseph Buonaparte arrived at Madrid to assume the regal power; but the inherent force of the nation was irresistible, and he was driven from his precarious dignity. Then came the Peninsular war, with all its glories, and its expenditure of blood and treasure. In 1814, Ferdinand returned to his country. He married four times; and by his last wife had one daughter, which daughter he proclaimed heir to the throne, to the exclusion of his brother, Don Carlos. This declaration he subsequently annulled, but, eventually, finally confirmed. Don Carlos, at his brother's death, asserted his claim to the sovereignty, with, as it is said, the support and concurrence of a great majority of the people. Foreign interference has hitherto thwarted the views of Don Carlos, whose consort, harassed by misfortunes, privations, and anxieties, has fallen a victim to persecution, and died in the parsonage-house of a village near Gosport. The success of the widow

of Don Ferdinand has enabled her to proclaim her daughter as Queen of Spain, she herself assuming the title and character of Regent. By this revolution, for such it is, the Spanish throne is occupied *by a child.*

Belgium and Holland have been separated; Antwerp has been besieged by the French; the Prince of Saxe Coburg, widower of the Princess Charlotte of Wales, has been made king of the Belgians, and married a daughter of the occupier of the French throne. The affairs of Greece, which have been so long unsettled, are as unsettled still, with this difference, that England has furnished her with a king, in the person of Prince Otho of Bavaria, whose revenue is derived from this country, but whose period of domination is fortunately not to be calculated upon with any degree of certainty.

In Russia, after the murder of Paul, Alexander succeeded, and did not die without some suspicion of foul play. He was succeeded by his brother, Nicholas the First, whose elder brother, Constantine, with a most remarkable diffidence, or indifference to imperial sway, declined the throne in his favour.

It must be evident that, if the extent or pretensions of this paper would admit of our taking a review of the public affairs of all the nations in the world during the period to which it refers, it would exhibit a series of mutations calculated equally to justify our opinion of the eventfulness of the last thirty-four years with those we have hastily touched. Our chief object is, however, to look to results as relating to England herself.

In England the circumstances connected with the succession have been complicated and extraordinary. In 1820, George the Third died, having survived his fifth son, the Duke of Kent, six days. The Princess Charlotte died, with her infant, in 1817; Queen Charlotte in 1818; the Duchess of York in 1820; in 1821, Queen Caroline; in 1827, the lamented Duke of York; in 1828, the Queen of Wirtemberg, princess royal of England; and in 1830, his late most excellent majesty. The present king has no surviving issue; and the crown hereafter devolves upon the daughter of his late majesty's fifth son—*a child.*

In 1814, the electorate of Hanover was erected into a kingdom, the crown of which belongs to the King of England, but is separated from it whenever a queen governs this empire; consequently, upon the accession of the Princess Victoria to the British throne, the Duke of Cumberland, as next heir to the crown, becomes King of Hanover—the Salic law in that kingdom excluding females.

There are peculiarities of circumstance in this mortality of the royal family (which it would neither be right, nor indeed have we space to enter into them, even if it were) which render the course and order of these events very remarkable. Not less so have been the casualties by which the ministers of the crown and many eminent men have been removed from their stations during the period to which these observations refer. After the death of Pitt, avowedly accelerated, if not actually caused, by his devotion to his country, how soon died his great opponent, Fox? Lord Granville is dead: Percival was murdered; Lord Liverpool stricken by a calamity which left his body living after the mind was dead; Windham and Huskisson, both victims of accidents: Canning prematurely lost; and Lord Londonderry fallen by his own hand; Nelson, and Moore, and Abercrombie in battle; with a host of heroes equally deserving the tears and praises of their countrymen.*

Remember that such men as Thurlow, Erskine, Gifford, Law, Kenyon, Grattan, Curran, have lived and died within this century. In literature, and wit, and poetry, can we forget Sheridan, Murphy, Cumberland, Cowper, Byron, and SCOTT! in Science, Banks and Davy; in art, West and Lawrence; or the stage, Siddons and Kemble. All these are gone,—faded from the scenes which they exalted and adorned. We mention but the very leaders, but, taking every branch of art and science into calculation, the aggregate amount of loss within the last thirty-four years will, hereafter, when time and reflection shall have overcome jealousy and envy, be found vastly to exceed that which this country ever sustained during any other period of equal duration.†

But now let us look at things less questionable. In the present century, the bright career of the Duke of Wellington may be said to have been run; for although his services before and up to the capture of Seringapatam, in 1799, had raised his character and spread his fame, it was in this century that his celebrated battle of Assaye was fought. From his arrival in Europe, until the year 1815, he gained that series of victories which have immortalised him. But that is not all that we have to illustrate our point; besides the glorious days of Oporto, Vimiera, Talavera, Buzaco, Salamanca, Badajos, Vittoria, Nive, Toulouse, St. Jean de Luz, the Pyrenees, and WATERLOO, we are prepared to show that more general actions were fought, and more lives lost by the fortune of war from 1800 to 1815 than ever were fought in a period of ten times the same extent;—amongst them, Marengo, Alexandria, Austerlitz, Corunna, Aspen and Essling, Wagram, Borossa, Albuera, Borodino, Lutzen, Toplitz,

* In the melancholy record of suicides may be inserted the names of Romilly, Whitbread, and Calcraft.

† Where there is not space to give the entire list of those eminent in each line, it might appear invidious to name any except the acknowledged "heads" of professions; but in the two instances of art and the drama, we think no thirty-four years in the annals of the nation possessed and lost so many, and such distinguished men in the former, as Opie, Owen, Copley, Romney, Jackson, Harlowe, Northcote, Hamilton, Cosway, Wheatley, Smirke, Stothard, Hoppner, and others, no doubt, which at the moment do not occur; or in the latter, such a combination of talent as was to be found in the genius and powers of Elliston, Munden, Johnstone, Cooke, Emery, Suett, Palmer, Lewis, Holman, Quick, Knight, King, Moody, Wroughton, Kean, Mrs. Mattocks, Miss Pope, Mrs. Billington, Madame Storace, Mrs. Jordan, Mrs. Bland, Mrs. Davenport (alive, but retired), and Bannister, similarly situated. This, we say, is but an imperfect catalogue, but it is sufficiently extensive to illustrate our principle.

Leipzic, Orthes, Ligny, besides others, amounting *to nearly two hundred general actions*. It has been only because Nelson at Trafalgar established the sovereignty of England on the seas that we have not to record equal triumphs of our navy to those which have graced our army.

But, then, let us see what has taken place in civil life. England has been united with Ireland; the test and corporation acts have been repealed; thirty millions of taxes have been removed; the Roman Catholics have been emancipated; slavery has been abolished; parliament has been reformed; the poor-laws have been changed; the constitution of the church of Ireland has been altered; several bishops have been reduced; the East India Company's privileges have been abrogated; the bank has resumed cash payments; bank notes are now a legal tender; the game laws have been repealed, since which time poaching has increased in a ten-fold degree; beer houses have been permitted in order to better the morals of the lower classes, which have produced drunkenness and all its evils to an unparalleled extent; for humanity's sake, forgery has been made punishable with transportation and not death, since which forgery has increased very much in the same ratio as drunkenness and poaching. It would, however, greatly exceed our limits, as we have already said, to enter into minute details of the wonderful alterations which have been worked during the century; we shall, therefore, select a few of those which strike the senses most forcibly, and which, from circumstances and localities, are most familiar, reserving to ourselves for some other opportunity a more elaborate working-out of our proposition.

During this century, England has acquired the Cape, Ceylon, Curaçoa, Demarara, St. Eustatius, Mauritius, Bourbon, Madeira, Malta, Martinique, Senegal, and Surinam—several of which have been ceded, But what are these?—what are her conquests in Egypt?—what her successful warfare at Nepaul or in the Burmese country?—what her wonderful extension of territory in India?—what her capture of Algiers?—what her sovereignty of the Ionian Islands?—what the recollections of the share she has borne in the glories of the world, under Providence, compared with the strides she has made in art, science, and mechanism since 1800?

In 1800, would any man have believed—and in 1800 men fancied they traveled at a most extraordinary pace—would any man have believed that he could leave London in a stage-coach in the morning, and eat his supper by eleven o'clock at night in Manchester? or if his credulity could have been stretched so as to admit of such a possibility, would he have suffered himself to be told with impunity that if he chose, instead of supping at Manchester, he might proceed to Liverpool in one hour and three-quarters—a distance of upwards of thirty-miles—that he might steam himself over to Dublin in time for breakfast the next morning, all of which he may now do supposing the conveyances ready? but, as it is, and without any hurry or trouble, a man breakfasts at the Bull and Mouth in London on the Monday, and breakfasts in Dublin on the Wednesday, according to the ordinary and established rules of stage coach, rail-road, and steam-boat travelling.

Well then, say we, this introduction of steam, or rather its adaptation to vessels and locomotive carriages, has been—and it is in its infancy yet—one of the greatest strides ever made in so short a space of time. Next comes gas. Let any body read Mr. Davies Giddy's, now Mr. Davies Gilbert's, formal denunciation in the house of commons of the bare idea of obtaining light and profit from gas, and the case will be made as strong as we can wish it. Not only is the use of gas as a light universal, but if any body will take the trouble, or rather give themselves the pleasure, of visiting the gallery of national sciences, in the Lowther arcade, they will find cookery performed by gas in the most perfect and satisfactory manner.

Within the present century, vaccination has superseded, nay, annihilated, that tremendous affliction the small-pox—an event to which the wonderful decrease in the mortality of all classes, proportionably to the general increase of the population, may, in a great degree, be attributed, despite the evidence to the contrary afforded in the maudlin report of the drunken parliamentary committee of the present year. Again, reducing, as we must, our sphere of observation, for want of room, let us look at our own metropolis within the present century; hovels and alleys have disappeared, and palaces and terraces risen in their places. Look at those splendid bridges, Waterloo and London—the vast iron bridge across the Thames in the city, and the extremely useful one at Vauxhall—see those stupendous works, the West India Docks, East India Docks, London Docks, St. Catherine Docks, Surry Canal Docks, all erected within this century—the magnificent Custom-house, the healthy and spacious Bedlam, the London University, the King's College. Within this century Ranelagh has vanished from the earth, the Pantheon has become a bazaar, every theatre in London, except the opera house, which had just risen from a conflagration, has been either burned or pulled down—Covent Garden, Drury-lane, the English Opera House, the Surry Theatre once, and Astley's twice, have been burned and rebuilt—the Haymarket pulled down, the Royalty pulled down, both rebuilt, and the latter, under the title of the Brunswick, destroyed in the twinkling of an eye.

Carlton House, with all its splendour and gaieties, and all the associations of wit and mirth, has, with the noble and joyous company which made its walls ring with festivity, vanished. The Prince! Fox, Sheridan, Fitzpatrick, Hanger, Erskine, the Duke of Norfolk, and fifty others, are in their graves, the scene of their revels exists no more, splendid terraces and magnificent squares occupy its site. The wretched streets between Pall-Mall and Oxford street have given place to grand and commodious drives and promenades.

The interior of St. James's Park, which was a swampy meadow for the dull diversion of smoke-dried cows, has become a beautiful garden; and Buckingham House, built in the full uniform of bad taste—"red with white facings"—has given place to a palace much censured originally, and

latterly much disfigured; but which still *is* a palace worthy of the country. In the Regent's Park, groves, canals, villas, parades, dioramas, (what did we know of dioramas in 1800?) crescents, and terraces, ranges of splendid buildings, occupy a space previously monopolised by grazing cattle; while a navigable canal, which circumvents London, and forms a military ditch round her assailable parts, in case of rebellion, brings all the commodities of the world floating to the very doors of warehouses in the most *inland* part of the metropolis.

In order to tranquillise the country, we have fifteen judges instead of "the twelve"—we have also "a vice-chancellor" to moderate the rigours of the law; and we have, what is more to the point, a Sir Somebody Macadam, who, by breaking the stones over which we used to travel, has more successfully conduced to *tranquillise the town* than any thing else in the world, except perhaps the New Metropolitan Police, which has utterly and entirely exterminated the ancient race of watchmen, except, we believe, in the case of one deluded veteran, who, under the special auspices of the Protestant Bishop of London, and the Popish Duke of Norfolk, still continues to howl at the moon in St. James's square. In consequence of this macadamisation, the Londoners no longer measure distances by being on or off the stones, and are whisked in wet weather over noiseless masses of mud-pudding, in hearses painted of lively colours, called omnibuses,—vehicles of French origin,—in which they are packed by dozens; or whirled through the thorough-fares in hack cabriolets, carriages of which no human being in 1800 had any defined or undefined notion.

Of greater things, look at the Breakwater at Plymouth, at the Tunnel under the Thames,—even unfinished as it is, and unprofitable as it ever will be, it is a triumph of science and perseverance—look at those bridges, hanging, as it were, in air, spanning arms of the sea, which, in 1800, no man would have thought possible by such means. That pretty toy, the chain pier at Brighton, is a toy that no man would have imagined in 1800. Who, in 1800, would have expected to find water without digging for it? Who would have engraved upon stone? Who would have thought of calculating sums by machinery? Who would have thought of stuffing cushions with iron for softness? Who would have worn a caoutchouc cloak or Indian rubber shoes to keep them from the wet, or who would have fancied it possible to make gin up the chimney while he was making bread in the oven?

Look, too, at society. The young men drink nothing—in 1800 they drank deeply; in 1800, a man who smoked would have been voted a beast; now the vulgar under-bred shop-boys smoke about the streets, because they have heard that their betters do it elsewhere. Smoking was introduced during those campaigns to which we have already alluded, and then there were millions of reasons for its use; now nobody but the lowest and vulgarest continue the practice;—and what makes this custom as absurd as it is filthy, is the justification which these simpletons offer, by quoting it as a foreign custom: in no foreign city is this nastiness permitted in the streets—it may be in Paris, but that under the citizen-king is exactly the place for it.

Look at our balls: in 1800, modest women danced modestly, and let the conversation which passed between two partners, standing as far distant from each other as people ordinarily do in a drawing-room, be what it might, it could do no harm in the way of example. Within this century it has become the fashion for a delicate girl, who would, as Fielding's "Huncamunca" says, "shudder at the gross idea" of man's advance, to permit herself, and be permitted by her mother—ay, or her husband—to flourish about a room to a wriggling German air, with a strange man's arm round her waist, and her delicate hand upon his brawny shoulder. This thing is called a waltz; there is another of the same character, called a gallopade, where the same operations are performed, and in which, instead of turning the woman about till she gets giddy, the fellow makes no more ado, but claps her up in his paws, and hurries her right on end from one corner of the room to the other.

A dance, to be sure, existed in the time of the "Spectator," which must have been something of the same sort, for the old gentleman says (No. 67, vol. i.) "I suppose this diversion was first invented to keep up a good understanding between young men and young women, but I am sure, had you been here, you would have seen great matter for speculation." This appears aptly to describe those irritating indecencies—the modern waltz and gallopade.

Another extraordinary change has taken place in London society; we mean the universal introduction of clubs and hotels. In 1800 it was remarkable that London had scarcely any hotels, while all other cities were full of them; now almost every second house in the streets below Grosvenor-square is an hotel. Clubs were rare, and used by no means as clubs are now; White's, as old as Hogarth's time—Brooke's and Boodle's—the Cocoa Tree, Graham's, and another, were all. The Union, which existed within this century, was a regular gambling club, and was held first at what is now the Ordnance Office, Pall Mall, and subsequently in the house now occupied by the Bishop of Winchester, in St. James's square; but all these were clubs of recreation and amusement, of conversation or dissipation. Now see the difference. Crockford's, with the best cook and coffee-room, rears a splendid front, and well may, for its members are of the first class, and the aspersions cast upon it of the falsest character. The Travellers' is a magnificent house; they play high in the evenings, but no game of chance that we know of. The Junior and Senior United Service Clubs—invaluable institutions—where our gallant defenders are enabled, upon their shamefully small half-pay, to enjoy the comforts and luxuries they have so gallantly earned, at an easy rate. The Union, a resort of wealthy citizens, who just fetch Charing-cross to inhale the fresh air as it draws from the Park through the funnel by Berkeley House, out of Spring Gardens, into their bay window; and the

Athenæum, where the mixture of whigs, radicals, savans, foreigners, dandies, authors, soldiers, sailors, lawyers, artists, doctors, and members of both houses of parliament, together with an exceedingly good average supply of bishops, renders the melange very agreeable, despite of some two or three bores who "continually do dine," and who, not satisfied with getting a six-shilling dinner for three and sixpence, "continually do complain."

Then there is the Wyndham Club, held at Lord Blessington's house, in St. James's square, and called after Lord Nugent, who founded it; the two University Clubs; the Clarence, mischievously called the Clearance, because it was established upon getting rid of some disagreeable members; and the Oriental Club, which, as its name implies, consists of the curry and rice gentlemen from India, with their calico shirts and limber legs, and which the young women who sweep the crossing at Tenterdon street (where, *par parenthese*, there has been within this century founded a Royal Academy of Music) invariably called the Horizontal Club. All these places, and there are one or two others, especially one called the Garrick, near Covent-garden, and another in Broad street, called "the City,"—have been established upon a principle of economy, and on a scale of comfort and elegance which would have sounded like Hebrew to the unaccustomed ears of the world of 1800. The Carlton Club we have not noticed, because its splendid house in Pall Mall remains unfinished, owing to, what certainly was not known in 1800, a strike amongst the unionists. However, the Carlton is altogether a superior body, and ranks with, and perhaps above, the original White's, Brooke's and Boodle's.

We must restrain ourselves—mercy to our readers compel us to stop, at least for the present, satisfied that, as far as we have gone, we have made out our case, and promising to continue what we flatter ourselves is not an altogether uninteresting subject, upon some future occasion.

From the Westminster Review.

Voyage dans le District des Diamans et sur le Littoral du Bresil, suivi de Notes sur quelques Plantes caracteristiques, et d'un Precis de l'Histoire des Revolutions de l'Empire Bresilien depuis le commencement du Regne de Jean VI. jusqu'à l'Abdication de D. Pedro. Par Auguste De Saint-Hilaire, Chevalier de la Légion-d'Honneur, membre de l'Académie royale des Sciences de l'Institut de France, &c. &c. 2 vols. Paris, 1833.

Of the numerous provinces which constitute the vast empire of Brazil, none have excited more attention than that of the Mines, in which the celebrated Diamond District is situated. Thither Mawe, Luccock, and other modern travellers, animated by the spirit of trade, directed their footsteps. Towards the same point Captain Ashe, in his buccaneering expedition to Brazil, also proceeded; and inferior adventurers, condescending to smuggle where they would formerly have robbed, haunt the wild recesses of the Diamond Mountains, contending by skill and daring with the slothful satellites of the government. Respecting this part of the empire, M. De Saint-Hilaire's information is valuable. Previously, however, to the publication of his travels, numerous curious particulars concerning the Diamond Mines, the mode of working them, the regulations of the Brazilian government on the subject, the treatment of the slaves, &c., had been collected by the indefatigable Southey; but the memoirs on which he based his account having been somewhat antiquated, a description of the whole district by an eye-witness will be read with considerable interest. The present work is the result of the researches and observations of three years; or rather a portion of that result, for two volumes had been previously published, and two others are hereafter to appear.

As access to the Diamond District is exceedingly difficult, not only to strangers but likewise to the natives themselves, the notions which have been generally formed respecting it are particularly vague and imperfect. Its situation, moreover, in the lofty unfrequented part of the Province of the Mines, divided from the rest of the empire by a circle of rocks, frowning, bleak, and desolate, has contributed to generate and maintain unfounded surmises and mysterious ideas concerning its productions and resources, which have from the first been monopolised by the government. The impediments to a free ingress into this "Valley of Diamonds" consist not so much of the obstacles erected around it by nature, as in certain regulations constructed by the governors for their own benefit. By these, all persons not duly authorised,—formerly by the crown of Portugal, now of Brazil,—are forbidden to approach the sacred district. Bands of soldiers, armed as against a public enemy, vigilantly guard every avenue; the slaves are watched during their labours by numerous overseers; every precaution is taken, every invention resorted to, in order to secure to the crown the possession of that wealth which, in in general, appears to be the only object for which monarchs undertake the management of public affairs. But against these regulations, the same thirst of wealth that occasioned their enactment, arms a number of desperate men, who voluntarily risk life and all other prospects of fortune, for the chance of enriching themselves by defeating the ingenuity of despotism. These men, vulgarly denominated smugglers, repairing by circuitous tracks to the rugged precipitous chain of crags which encompass the Diamond District, contrive during the prevalence of heavy fogs upon the mountains, or in the darkness of the night, to descend unseen into the valley, where they sometimes lie concealed for many days in the huts of the slaves by whose thefts they are supplied.

The discovery of the Diamond Mines of Brazil, which has proved so detrimental to the prosperity of India, took place early in the eighteenth century. In 1730 the diamonds were declared royal property, though all persons were permitted, under certain regulations, to engage in their extractions. On every negro thus employed, a capitation tax, varying from 1*l.* 6*s.* 0½*d.* to 13*l.* 0*s.* 5*d.*, was imposed. Such a mode of levying taxes, as

M. De Saint-Hilaire observes, was palpably unjust; for in so uncertain an undertaking the proceeds are by no means necessarily proportioned to the number of hands employed. In a few years an entire change in the system was effected, not from any conviction of its injustice, but because it was found that owing to the extraordinary increase in the number of diamonds brought into the market, their value had diminished three fourths. Measures were therefore taken to limit the extent of the supply. In 1735, the Diamond Mines were farmed at 35,854*l.* 3*s.* 4*d.* per annum; but the speculators were bound to employ no more than six hundred slaves; and this system was continued until 1772.*

It was, however, discovered that the working of the Diamond Mines by private individuals, whose interests were diametrically opposed to those of the government, as in despotisms they always must be, was accompanied by frauds and abuses of various kinds; and in consequence, another change was accomplished. The government now determined to take into its own hands the superintendence of the mines; new regulations were drawn up, which, as Southey has observed, bore on the face of them the impress of the character of Pombal, then minister. By these new ordinances the Diamond District was still more effectually cut off from the rest of the world. Situated in a country governed by absolute power, it was now subjected to a despotism still more absolute; all social ties were snapped asunder, or greatly enfeebled,—in short, every thing was sacrificed to the design of securing the exclusive property of the diamonds to the crown. In several instances, however, the extreme severity of

* The manner in which the precious stones of Brazil were formerly distributed through Europe, is thus described by Lord Tyrawley, in a memoir addressed to the British government, in behalf of certain Portuguese merchants, whose property had been, by some irregularity, confiscated.

"They put this affair under two heads;—first, as a point of law; secondly, as a point of trade: As to the first, as I believe nobody here has read the act of parliament concerning the importation of diamonds, I cannot tell how it is possible to form any true judgment upon this seizure. The chief persons concerned in those diamonds declare, they have no apprehension of a loss, insisting that it has always been customary to send them in that manner, and that they could not be seized in the mail. They further say, that it is publicly known that the diamond trade is, and has ever been, carried on throughout Europe by the post, being sent in that manner from one place to another, and backwards and forwards as there was a demand for them; and notwithstanding an act of parliament by which a duty has been laid on them in England, the same method of exporting and importing them has been continued in an open and public manner at the General Post House in London, and no seizure has ever been made before. Those that receive them at the post office in London, paid the common postage of the packet, by weight, besides one per cent upon a favourable valuation without showing them; and when delivered at the post house to be sent abroad, there is one guinea paid for each packet, for registering the same, and postage when it is due. Now as our common law in England is as much founded upon customs and precedents as upon statutes and acts of parliament, and in some cases customs prevail; for I make no doubt there are some laws which have never been repealed, that are entirely abrogated by a constant practice against them: therefore it seems to them, that if this method of importing diamonds can be proved (as they affirm it may) to have been always openly practised, and authorised at the post office, those that were in the mail at Falmouth, however regularly the custom house officers may have made their seizure according to the letter of the laws, cannot be condemned, but only are liable to the duty upon them; since as well those who sent them from Lisbon in that manner, as those to whom they were consigned in London, acted by precedents, upon the public faith of the Post House, and according to a custom practised time out of mind."

"As to the point of trade, they say that even the laying any duty upon the importation of rough diamonds is destructive to it, since the greater quantity of rough diamonds are imported, the greater the benefit is to the nation; and that the duty upon them with the penalty of confiscation, if not taken off very soon, will turn that rich channel out of ours into our neighbour's country, and give them the advantage which we now have in that trade over all the rest of Europe."

"As diamonds are worn and have a real value in all Europe, as well as in most other parts of the world, and must be cut and polished before they are fit to be worn, of consequence that country where the most diamond cutters are settled, and where the fair or market is kept for that commodity from whence the rest of Europe must be supplied, must have a considerable gain."

"When diamonds were only found in the East Indies, the settlement which our country had at Fort George had almost brought the whole diamond trade into the hands of the English; so that London, within these thirty years, is become the best market for them in Europe; and upon that account the best diamond cutters have come over and settled there: it has also been for a long time the place where diamonds, but especially brilliants, are cut in the greatest perfection."

"The discovery of the diamonds in the mines of the Brazils, has put a stop for the present to that trade from the East Indies, though not to the London market, on account of the advantage which England has over its neighbours in the trade with Lisbon with the packets, men of war, and merchant ships, which are constantly going backwards and forwards between the two countries; so that the much greater part of the diamonds which come from the Brazils have hitherto gone to London, from whence they were distributed to the rest of Europe. But should the seizure at Falmouth prove a loss, or should the duty remain on diamonds in England, it is very natural to suppose, that merchants would trade to those places where they can do it to the most safety and advantage. I am told they cut and polish diamonds very well at Amsterdam; great quantities, but especially small ones, are cut at Antwerp. In Paris they cut brilliants very well: there are also diamond cutters in Venice and in Hamburgh; and in none of these places do the diamonds pay any duty, or run any risk of confiscation. And particularly Amsterdam stands the fairest to rob us of that trade, if any hardships are laid upon it in England, as being better situated by far than London, to circulate them through the rest of Europe."

"The price of cutting and polishing diamonds, I find they allow to be at 20*s.* a carat, one with another; which our calculators here make amount to the sum of 75,000*l.* a-year. Was this the only profit, I should think it not to be despised; but there is besides, the freight, commissions, brokerages, and the gains that are made upon what is sold in London, both rough and cut, for foreign parts; all this is real profit to England, and is considerably increasing every day since the finding out the new mines in the Brazils."—*Southey's History of Brazil*, iii. *Notes.*

the regulations caused them to fall, like the laws of Draco, into desuetude; those for example, intended to limit the amount of the population and the number of the merchants; which condemned to confiscation or the galleys a negro detected with mining implements in his possession, or prohibited the sinking of the foundations of a house unless four officers of government were present.

When M. De Saint-Hilaire visited the mines in 1817, the administration had undergone successive modifications. The principal officer, at this period, was denominated the intendant of the diamonds, whose jurisdiction extended over the whole province. His power was nearly absolute. He regulated at his pleasure every thing connected with the working of the diamond mines, removed or suspended the employés, refused or granted permission to enter the district,—without which even the governors of the province themselves had not the power to pass its boundaries,—took whatever measures he judged proper for the prevention of smuggling, and directed the movements of the military force. But the authority of the intendant was not confined to what more immediately concerned the mines: the police in the interior of the district was under his control; and being at once an administrator and a judge, it was necessary that he should have studied jurisprudence. In civil transactions, where the value of the property in litigation did not exceed one hundred thousand reis (25*l.* sterling), he judged without audience or appeal. Lawyers were banished from the district, the government fearing, not so much perhaps their ability to make the worse appear the better reason, as that they might obstruct the movements of despotism by their knowledge of law and the force of eloquence. The authority of the intendant in criminal affairs was extremely bounded. The treasury in which the diamonds were deposited, had three keys, one of which was placed in the hands of the intendant, the second in those of the first treasurer, and the third was held by the principal clerk.

The places where diamonds are found, and where a body of slaves, with the requisite officers and overseer, are established, are called "services." According to the regulations, each of these troops should have a separate chaplain; but the administration being exceedingly poor, and therefore compelled to be economical, has commenced its reforms by diminishing the number of priests; one chaplain being compelled to superintend two troops of negroes, when they happen to work at the same "service." Mr. Mawe ("Travels in the Interior of Brazil,") appears to have been misinformed respecting the degree of attention bestowed by the government on the health of these slaves. He asserts that each body of negroes possessed a surgeon. This M. De Saint-Hilaire somewhat roughly contradicts, observing that when the government suppressed the farming of the diamonds, it purchased from the farmers the slaves whom they had employed. A hospital was then established, to which a physician and surgeon were attached; but the slaves not being at present the property of government, there no longer exists any necessity for a hospital or physicians. All the negroes who labour in the different services belong to private individuals, who hire them, at so much per week, to the administration of the mines. They once amounted to three thousand; but the increasing poverty of the government has caused this number to be diminished to one thousand; and their pay has also been reduced to less than half of what it formerly was. Each negro is clothed, and furnished with medical attendance during sickness, at the expense of his owner; but he is maintained and supplied with tools by the administration.

The condition of these slaves, whose labours furnish the costly gems which sparkle on the bosom or amid the tresses of beauty, forms a striking contrast with that of the classes whom they enrich or adorn by their toil. A wretched species of food, scantily doled out, enables them to sustain for a few years the weight of their misery. Domestic animals, dogs, cats, hogs, are generally better fed, and more tenderly treated. A quantity of coarse maize flour, a certain proportion of kidney beans, and a little salt, constitute the whole of their food; to which, by way of luxury, a small quantity of roll tobacco is added. When the kidney beans fail, their place is supplied by some kind of animal food. As very little time is allowed the negroes during the day, they are compelled to dress their food on the preceding evening, sometimes with no other fuel than a little dried grass. Being forced to remain, almost the whole year, with their feet all day in the water, living on food little strengthening or nutritious, and generally cold or badly cooked, they are subject to enfeebling disorders, arising from the debilitated state of the alimentary canal. Frequently, moreover, they incur the risk of being crushed by falling rocks, or avalanches of earth, which suddenly detach themselves from the face of the precipices. This labour is painful, and without intermission. Constantly under the eye of the overseer, to snatch a moment's repose is beyond their power. Nevertheless, such is the wretchedness of their condition in the domestic or particular service of their owners, such the natural appetite of man for gain, such the force of the most remote expectation of liberty, that these unfortunate beings, hard as is their labour, and badly as they are fed, exhibit a decided preference for this species of employment. The money, observes M. De Saint-Hilaire, which they procure by secreting diamonds, and the hope of emancipation should they be fortunate enough to find a gem of a certain size, are doubtless the principal causes of this preference; but they have also other motives. Being collected together in large numbers, they contrive, in spite of their wretchedness, to excite each other to merriment, singing in chorus the songs of their native land; and whereas in the houses of their masters they are subject to a thousand caprices, here they obey one fixed rule, and so long as they conform to it, need fear no chastisement.

In ancient Egypt, as is learned from the sepulchral paintings of Eilithyias, even the reapers in the fields were kept in order by the fear of the whip; and the relation of Agatharchides discloses the character of the cruel regulations to which

the labourers in the emerald mines, in the eastern desert, were subjected. The practices of despotism are the same in all ages and countries. In the diamond mines of Brazil, the whip is the principal incentive to industry; each of the overseers being generally armed with a large stick, terminated by a strip of leather, with which he is permitted to chastise upon the spot any negro whom he considers negligent. It may easily be imagined how frequently such a being, constantly irritated by the irksomeness of his employment, must be tempted to strike. No "fixed rule" was ever observed by men so armed; if the negro does not transgress the bounds of his duty, the overseer may be intoxicated by wine, by passion, by the mere irritation of temper incident to all persons who lead inactive lives. When the fault is of a serious nature, a more severe punishment is inflicted; the criminal on these occasions being tied to a ladder, and scourged by two of his companions with a whip of five thongs. The overseers are not permitted to lavish this terrible species of torture without the concurrence of their superior officers; but the extent of their humanity may be judged of by the circumstance, that although the ordinances of the mines limit the number of blows to fifty, these amateur floggers frequently indulge themselves with an exhibition more sanguinary than the law has provided for their entertainment. After this, it is not surprising that the lives of the slaves should be short and uncertain.

From this wretched mode of life a fortunate accident sometimes frees the slave. When he happens to find a diamond weighing an octavo, or 17½ carats, his value is ascertained by the administration, the price is paid to his owner, he is dressed, and set at liberty. His comrades, rejoicing at his good fortune, place a crown upon his head, make a feast, and bear him in triumph on their shoulders. He is entitled to preserve his situation in the mines, and receive weekly the sum formerly paid to his owner. If the diamond weighs only three fourths of an octavo, the slave still obtains his freedom, though he is obliged to labour for the government some time longer. Such occurrences, however, are not frequent. In 1816, out of one thousand negroes, three only obtained their liberty; and in the following year not a single instance had occurred up to the month of October, the period of M. De Saint-Hilaire's visit. For the discovery of diamonds of inferior weight and value, the slaves receive trifling rewards, as a knife, a hat, a waistcoat, &c.

When the negro finds a diamond, he shows it to the overseer, holding it between his forefinger and thumb, and spreading his other fingers; after which he deposits it in the wooden bowl suspended from the roof of the shed beneath which the operation of washing is carried on. At nightfall, the overseers in a body bear the bowl to the special administrator, who takes an account of the diamonds found, causes their number and weight to be ascertained, and puts them in a purse, which he is supposed always to wear about his person. Monthly, or at shorter intervals should the junta require it, the diamonds are deposited in the treasury, each administrator forwarding those found in his service, by one or two overseers accompanied by a number of slaves. The treasurers verify the number of the gems delivered to them, weigh them again, and enter in a book an exact account of their weight, the name of the service where they were found, and the dates of their reception. These preliminaries completed, they lodge them in the treasury. Every year they send to Rio de Janeiro the diamonds found during the preceding twelve months, in the following manner. They have twelve sieves, each pierced with holes of a different size; the first, large, the rest diminishing gradually; and through these the gems are successively passed. The largest diamonds remain in the first sieve, those a size less in the second; and so on, until the smallest fall even through the last. Thus they are divided into twelve lots, each of which is made up into a separate packet, enclosed in bags; and these are again placed in a chest, on which the intendant, the fiscal, and the first treasurer put their seals. This done, the chest departs, accompanied by an officer appointed by the intendant, with two horse-soldiers, and four infantry under his command. On arriving at Villa Rica, it is conveyed to the general, who, without opening it, affixes his seal; it is then forwarded under the protection of the same escort to the capital.

The military force at the disposition of the intendant and administration consists of two companies of infantry, and a datachment of the regiment of the province amounting to fifty men, including the officers. The detachment of cavalry is commanded by a captain. Twenty men are cantoned on the frontiers of the district, to prevent smuggling, visit travellers who are leaving the province, or arrest those who attempt to enter without the permission of the intendant. The remainder of the detachment is generally quartered at Tijuco, where it is employed in the service of the police, or in escorting the chests of diamonds to the capital.

It has been seen, says M. De Saint-Hilaire, that the system of administration introduced into the Diamond District, has no other object than to secure to the king the exclusive possession of the gems. For this purpose every thing has been combined with the most marvellous sagacity; the most minute details have been entered into; every probability of thievery foreseen, and measures taken for defeating the most skilful and able robbers. Not satisfied, however, with combating the ingenuity of thievery by the most minute precautions, it has been judged necessary to oppose temptation by the fear of severe punishment. A free man convicted of smuggling is transported for ten years to Angola on the west coast of Africa, and condemned to have his property confiscated for the use of the crown. According to the ordinances, every slave detected in theft, is also to be confiscated; but this iniquitous regulation has fallen into desuetude. The delinquent, having first been scourged, is put in irons for a longer or shorter period, according to the value of the diamonds stolen; during this period no payment is made for his labour; and if his owner is not, as formerly, entirely deprived of his property, he is nevertheless punished for a fault which he did

not commit, and possessed no means of preventing. These condemned slaves form a separate band, treated more severely than the others, and employed in ruder toils.

It is in vain, however, that the rigour of the laws has been increased, and measures of prevention resorted to. Cupidity and skill set all terrors at defiance, and triumph over every obstacle. Formerly, when the diamonds were more abundant, and less difficult to extract, there existed a sort of smugglers, who, acting in concert, dispersed themselves over the places where the jewels were most plentifully found, and sought for them themselves. Some of the party, stationed as sentinels on the heights, gave notice to the labourers of the approach of the troops; upon which the whole band made their escape, climbing the most difficult and precipitous mountains. This was the practice that caused them to be denominated *grimpeiros*, or "climbers," from which, by corruption, the word *garimpeiros*, the appellation by which they are still known, has been formed. Since the diamonds have grown more rare, and require considerable labour to extract them from the earth, this extraordinary race of smugglers has disappeared, though a few fugitive negroes, miserable and desperate, still go in quest of chance jewels along the banks of the remote solitary streams. But though the *garimpeiros* have become extinct, smugglers will no doubt always remain, since they will always be supplied by the thievery of the slaves.

In this kind of slight of hand, the negroes exhibit a degree of subtlety which the most experienced knaves might behold with envy. The new comers, raw novices, on their arrival, are quickly instructed in the mysteries of the profession by the old, whom they very quickly rival in ability. One of the predecessors of M. Da Camara, intendant of the mines, complaining that the abstraction of diamonds had become extremely frequent, and accusing the administrators of being wanting in vigilance, was assured by the latter that the most active surveillance could not prevent the delinquencies of the slaves. Desirous, however, of ascertaining by experience the ability of the negroes, the intendant commanded the most adroit among them to appear before him, placed a small jewel amidst a heap of sand and flints in one of the channels where they usually washed for diamonds, and promised the slave his liberty if he could steal it without being detected in the theft. The negro then began washing the sand in the ordinary manner, while the intendant steadfastly fixed his eyes upon his movements. In a few minutes the magistrate demanded of the black, where the stone was. "If reliance may be placed on the word of a white man," replied the negro, "I am free;" and taking the diamond from his mouth, he showed it to the intendant.

But though the slaves may exhibit extraordinary tact and cunning in secreting the diamonds, it would be exceedingly difficult, without the connivance of their superiors, to carry on the practice to any great extent, or to dispose of them when obtained. Each overseer has the privilege of employing a number of his own negroes in the services, and it is easy to foresee in how many ways the master and slave may league together to defraud the government. Accordingly, as M. De Saint-Hilaire observes, while the slaves, during the operation of washing, filch the gems, the overseers engage with enthusiasm in smuggling, being commonly supplied by their own negroes. It is in fact quite evident, as he remarks, that the negroes would never have engaged in the practice of thievery, but for the temptations constantly held out to them by their superiors or other smugglers. Adventurous men, taking advantage of the night, repair to the different services by circuitous and almost inaccessible paths. They have their agents in the various troops of negroes, who, for a reward, bring to them such of their companions as have any thing to sell. The diamonds are weighed, and the negroes receive at the rate of 12*s.* 6*d*, per *vinten* for stones of all sizes. Frequently the smuggler, engaged in numerous transactions, is unable to effect his retreat before morning; in which case he conceals himself in the huts of the slaves, where he remains all day, and makes his escape the following night. Having cleared the outposts, the smuggler proceeds to Tijuco or to Villa do Principe, where he disposes of his purchases to the shopkeepers. In many cases, merchants travel thither from Rio de Janeiro, with stuffs, mercery, and other articles, in order to have a plausible pretext for sojourning there for a time; but their real object is the buying of diamonds. At Tijuco, the profit of the smuggler on the smaller diamonds does not exceed twenty-five per cent; but at Villa do Principe, in reaching which he has incurred greater risks, his profits amount to forty per cent. As the negroes sell by weight all the diamonds they steal, without any reference to their size, it is on the larger ones that the smuggler gains most; but it frequently happens that the novices in this species of traffic are deceived in their dealings with the slaves, who substitute small pieces of crystal, to which they have given the requisite appearance and colour by breaking and rubbing them among grains of lead. But the experienced smuggler is not thus to be deceived. He distinguishes in an instant the false stones from the true, by rubbing one against another, putting them in his mouth and striking them against his teeth, to discover whether they will yield that silvery sound which diamonds thus assayed emit.

The temporary villages which spring up rapidly in the vicinity of the mines, and fall to decay with equal rapidity when the works are abandoned, present, while they last, a not unpleasing appearance, perched on the sunny slopes of the hills, or on the romantic precipitous banks of the diamond streams. One of these curious establishments is thus described by M. De Saint-Hilaire.

"The houses of the troop of Corrego Novo, in number twenty-two, form a small hamlet rising on a gentle slope above the stream. They are constructed with earth, and thatched with straw, and stand round a square open space. None of them possess a second story; and their roofs, very different from those which are elsewhere seen in Brazil, are considerably higher than the walls that support them. The huts of the negroes, inferior in size to those of the overseers, have no windows, and are each inhabited by several slaves. Those of the overseers, on

the other hand, are furnished with casements, are white-washed, and in many instances surrounded with gardens, in which I observed peach-trees in blossom. Two overseers dwell in the same house, which contains two apartments and a kitchen. The administrator occupies an entire mansion, and with him I remained during my stay at Corrego Novo."—I. 29.

In most cases, the working of gold or diamond mines,—and the remark may perhaps be applied to many other sorts of mining,—must be regarded as a species of gambling; at all events its results on the moral constitution are to a certain extent the same. Sudden exaltation from poverty to riches, succeeded by expensive habits, dissipation, voluptuousness, and an utter distaste for the more ordinary processes of industry, marks the career of both the gambler and the miner. Even in the midst of poverty he dreams of incalculable wealth, refuses to direct his attention to any useful employment, and constantly deluded by insane hallucinations, drags on a life of wretchedness, with El Dorado ever glittering before his imagination. The provinces traversed by M. De Saint-Hilaire furnish numerous examples of this kind of madness. Formerly, great fortunes were sometimes acquired by a lucky accident, with marvellous rapidity, when near the Rio do Carmo, gold, as Luccock observes, was frequently found by plucking up the grass, and shaking the roots. Those days, however, are now over; yet numbers of adventurers, stimulated by these hackneyed traditions, continue to haunt the neighbourhood of the old mines, digging and burrowing in the earth without ceasing, though their gains scarcely suffice in many cases to preserve them from starving. One of the haunts of a band of these miserable dreamers is thus described.

"The village of Chapada, where I halted, is situated on a flattish semi-globular hill, surrounded by other rocky eminences of similar formation. All around, the soil is dry and hungry, and rocks and white sand every where peep forth among the scanty herbage. About thirty wretched huts, scattered around confusedly, constitute the village. Their roofs, like those of Rio Pardo, have an exceedingly steep slope, which is rendered necessary by the nature of the grass with which they are covered; for being soft and fine, it would admit the rain water, if laid upon a more inclined surface. The brooks that flow near Chapada formerly yielded considerable quantities of diamonds; but the majority no longer furnishing any, the intendant permits the search after gold, upon the produce of which the inhabitants of the village now subsist. These men, who are all mulattoes, value at four *vintens* [about 9½*d.*] the gold they can collect in a day; but, should they even conceal a portion of their gain, their poverty proves too plainly that it cannot be great. No trace of cultivation appears in the neighbourhood; though the heat of these elevated regions not being very intense, there can be no doubt that rye would succeed extremely well in certain positions. But the truth is, the search after gold is more agreeable than agriculture, to the lazy habits of the natives in the auriferous districts."—I. 31.

In Europe, it may be generally remarked, horned cattle are less beautiful in form, and their flesh of an inferior quality, on proceeding towards the south. Except perhaps in the rich pasturages of Lombardy, and the Duchy of Parma, cows also yield less milk. In Egypt, where little attention is paid to the breeding of cattle, the cows are nevertheless fine, and their milk abundant; but this result is attributable to the humidity of the air, and the abundance and succulent nature of the grasses. The air of the mountainous regions of Brazil being generally dry and piercing, and the herbage scanty, the same rule which prevails in Europe holds good; the cows, though they present a fine appearance, having small udders, and yielding a very trifling supply of milk. At Tijuco, the capital of the Diamond District, a superior degree of industry, and cleanliness its natural accompaniment, prevails. Though encircled by ridges of naked rocks, and mountains perforated and broken up in search of gold, and covered with extensive mounds of gray and barren rubbish, the vicinity of the town exhibits a smiling prospect of rich variegated verdure. Gardens are extremely numerous, each house possessing its own. Here grow the orange tree, the banana, the peach, the fig, the quince tree, and the pine. The common vegetables of Europe are likewise cultivated, such as the cabbage, the lettuce, chicory, the potato, with various herbs and flowers, among which the violet is the favourite.

"The gardens of Tijuco, though arranged without any regard to symmetry, appeared to be cultivated with more care than any I had elsewhere seen. However this may be, from the intermixture of houses and gardens differently grouped, and scattered on an inclined plane, arise the most agreeable points of view. From many of the houses we discover not only those situated lower down on the slope of the hill, but the bottom also of the valley, and the heights which rise in front of the city; and it would be difficult to describe the striking effect produced in the landscape by the contrast between the glossy freshness of the verdure of the gardens, the colour of the roofs, and the gray austere tints of the valley and encircling mountains."—I. 42.

Many remarkable phenomena are observable in the economy of trees and vegetables transplanted from Europe to these warmer regions. It has been found by experiment, that the dry season is most favourable to European plants, provided they are supplied with moisture by artificial irrigation; while those indigenous to the country appear to derive no benefit from this process. This difference, which at first sight seems so whimsical, is susceptible of an easy explanation. During the drought, the vegetables of Europe experience a temperature analogous to that of their native country; they do not run to seed so rapidly as during the heats, and irrigation supplies that moisture which they require. On the contrary, if the native plants do not grow at the same period, though watered by artificial means, it is because heat rather than moisture is wanted to promote their vegetation. It has been remarked, that in all probability the beautiful evergreen trees which constitute so pleasing a feature in the winter landscapes of Egypt, would become deciduous if transplanted into the colder climates of Europe. This conjecture is converted into certainty by what M. De Saint-Hilaire relates of the metamorphoses effected in the fruit trees of Europe when removed to Brazil. For a short period the peach tree, at Tijuco, is perfectly leafless; but the apple, the pear, and the quince trees,

which renew their leaves at the same season as the peach, are never without foliage. This apparent anomaly is explained by M. De Saint-Hilaire. The difference, he observes, which at first appears extremely singular, is the result of the dissimilarity that exists between the buds of the peach, and those of the quince and apple tree. In the peach tree, in fact, the buds containing the blossoms, distinct from those containing the leaves, appear first; in the quince and apple trees, on the contrary, the same buds contain both leaves and blossoms. The old foliage falls, and immediately the new buds appear, reclothing the trees before they are entirely bare. In the European fruit trees recently transported into Egypt, a similar process will probably take place; but sufficient time for observing the phenomena has not hitherto elapsed. Though in all respects evergreens, the sycamore, the rhamnus lotus, the palm tree, &c. by no means retain constantly the same clothing; but new leaves always putting forth before the old ones fall, their branches are never left entirely naked.

Near the capital of the Diamond District, M. De Saint-Hilaire was shown by the intendant the only American antiquities which he beheld during his travels. These were certain rude figures of birds, single or in whimsical groups, traced upon the smooth face of a rock by the way side. On quitting Tijuco, by the road leading over the Serra da Lapa, he traversed a desolate region, fertile in savage bold scenery, resembling in many respects the more barren portions of the Valaisan Alps. No trace of cultivation is any where visible. Gray precipices present themselves to the eye on all sides, communicating a wild and sombre aspect to the landscape. Springs burst forth in a thousand places, and the traveller is frequently startled as he moves along, by the noise of water rushing over the rocks. The appearance of the vegetation often changes as you advance, according to the nature and elevation of the soil; large forests, however, are no where seen; but the hollows are clothed with low shrubs, interspersed in many places with stunted trees. Where the soil changes from sandy to red and clayish, the appearance of large ferns indicates the former existence of extensive forests, which are always succeeded by this plant. On approaching Villa do Principe, the nature of the ground and the features of the landscape become suddenly different; and the transition from bleak arid mountains, to hills and deep valleys covered with the traces of magnificent forests, is peculiarly delightful.

The rich woodland scenes, formerly scattered more abundantly than at present over the surface of Brazil, have been more or less ably described by several writers. M. De Saint-Hilaire, though not apt to be warmed into enthusiasm by the presence or recollection of beautiful landscapes, endeavours also to convey an idea of the emotions excited by the passage through these primeval woods.

"Immediately after quitting Ocubas, I entered among virgin forests, whose vegetation was exceedingly vigorous. The road was extremely narrow, and innumerable trees of different foliage formed overhead a canopy impervious to the rays of the sun. Various species of liana, creeping from branch to branch, composed a sort of network on either side, and the roots of the *cipo d'imbé* descended like so many plumb-lines upon my head. In the silence of the forest, the *ferrador*, which I had not heard for several months, startled the echoes with its piercing notes, imitating with singular exactness the sounds produced by a smith using alternately the file and the hammer. As often as I traversed these primitive woods, after having been traveling for some time over the open country, I invariably experienced a feeling of profound admiration. It is there that nature unfolds all her grandeur; it is there that she seems to wanton in the variety of her productions; and, I cannot help observing with regret, splendid forests of this kind have been a thousand times destroyed without the slightest necessity."—I. 106.

Dr. Walsh, in his amusing "Notices," has drawn a lively picture of the manners of the capital, to which his experience was chiefly confined. The French traveller, whose habits and pursuits were wholly dissimilar, though he also at various intervals enjoyed ample opportunities of studying the peculiarities of the inhabitants of Rio Janeiro, appears to prefer the ruder simplicity of the provinces. From the concurrent testimony of all travellers it must be concluded that in every part of Brazil,—but above all in the interior,—ignorance the most complete, of whatever it especially concerns man to know, prevails. In morals and politics, it is not to be expected that any great proficiency should have been made. To this the united spirit of their religion and government is adverse. But in geography, in the common events of history,—even of the history of their own times,—they are so exceedingly ignorant, that, according to Dr. Walsh, several persons of respectability with whom he conversed, supposed Napoleon to have been a rebellious Portuguese general, and the Mississippi a river of Great Britain. In the catholic countries of Europe innumerable examples of gross superstition might readily be pointed out,—perhaps it might not even be necessary to have recourse to foreign experience in quest of such examples; but in Brazil, this moral darkness is infinitely more widely spread. A cross which M. Saint-Hilaire observed on the road-side, had been erected, as he learned from an inscription on its base, at the request or command of a number of unhappy souls, temporarily escaped from purgatory, who on that spot fluttered in the form of doves round the horse of a traveller, and expressed their desires in human voice. Hermits, saints, patients possessed by the devil, miracles, are things not uncommon in that part of the world. Wherever ignorance abounds, there imposture will always flourish. In fact it is a kind of hobgoblin, which like the Old Man of the Sea in the Arabian Nights, rides on the shoulders of ignorance, grinning triumphantly the while at the imbecility which enables it to keep its seat.

Travellers sometimes appear to wonder at the credulous simplicity on which in Mohammedan countries the influence of santons, dervishes, anchorites, &c. is founded. But perhaps the Moslems of the East exhibit not, in their superstitious reverence for those individuals, a greater absence of good sense, and of capacity to discriminate

between conduct advantageous to society and such as, if not absolutely injurious, is at least not beneficial, than is observed in the good people of Brazil. In the gloomy wild recesses of the Serra da Piedade, where it would be natural to look for the wolf or the eagle, are found a number of those fantastic solitaries, as they term themselves, who delight to live in idle seclusion at the expense of the more industrious of their countrymen.

"On the summit of the Serra da Piedade, has been erected a chapel of considerable size, close to which, on both sides, are other buildings for the accommodation of the hermits of the mountain, and the pilgrims whom devotion brings to the spot. All these edifices are of stone, and are not [in 1818] of above forty years' standing. Opposite to the chapel are rocks in the midst of which have been set up crosses, to mark the stations where certain ceremonies are performed during the Holy Week..... The hermits who inhabit this irregular kind of monastery are mere laymen, whose costume consists of a large hat and cassock, or black morning gown. At the period of my visit, there were only three of them; two very sprightly little mulattoes, and an old white man, at whose appearance I found it difficult to restrain my laughter, so quaint and fantastic did he seem with his rubicund face surmounted by an antique voluminous wig half eaten by the rats. The establishment of La Piedade possesses a *fazenda* and other lands, situated at the foot of the mountain; and it might be imagined that, like the ancient anchorites, these recluses devoted themselves to agriculture and the proper management of their possessions; but this is by no means the case; they find it more convenient to subsist on the charity of the public, and their *fazenda* merely serves them as an asylum, when, on returning from their begging circuit, they do not feel disposed to toil up the mountain. Their labour, it must be confessed, would not have sufficed to provide for their maintenance and the expenses of the chapel; but those two young, healthy, and vigorous mulattoes should at least have endeavoured to make the most of their lands, and applied to the humanity of the faithful when their own resources failed."—I. 138.

Deceived, like most other persons, by a respect for past ages, of whose vices and follies less is necessarily known than of our own, M. De Saint-Hilaire attributes to the ancient anchorites more estimable qualities perhaps than belonged to them. The number of these privileged vagabonds is not, he observes, very great in Brazil; but their habits and character are not such as to render this matter of regret.

On the same mountain the traveller observed another example of the extraordinary effects of superstition among so rude and uncivilised a population. Similar tragi-comedies, indeed, have been enacted in Europe, and at no very remote period; but they are not there of frequent occurrence, and may perhaps be regarded, when they appear, rather as the result of strange sudden epidemics, than of a permanent disorder in the constitution of men's minds. The *speciosa miracula* operated by animal magnetism in France are susceptible of easy explanation; having been in fact nothing more than a voluptuous jugglery, set on foot and carried on for very intelligible purposes. In Brazil, the case of Sister Germaine may be traced to a different source. It affords a striking illustration of the arts by which the priesthood in ignorant and enslaved nations maintain their influence over the minds of the vulgar.

"On the Serra da Piedade, I saw a woman of whom I had heard much in the *comarcas* of Sabará and Villa Rica. Sister Germaine, the woman in question, was attacked, in about 1808, by a hysterical affection, accompanied by violent convulsions. She was at first exorcised; remedies mal-adapted to her complaint were made use of, and her condition degenerated from bad to worse. At length, at the period of my visit, she had been for a long time reduced to so extreme a state of weakness, that she was no longer able to rise from her bed, and subsisted upon a regimen which would scarcely have supported the life of a new-born infant. Animal food, rich soups and gravies, her stomach was no longer in a condition to receive. Sweetmeats, cheese, a little bread or flour, constituted the whole of her food; frequently she was unable to retain what she had taken; and it was almost always necessary to use considerable persuasion to decide her to eat at all."

"It was on all hands admitted, that the manners of Germaine had always been pure, her conduct irreproachable. During the progress of her disorder, her devotion had daily assumed a more enthusiastic character. Fridays and Saturdays she fasted entirely; at first, indeed, her mother opposed this practice; but when Germaine declared that, during those two days, it was utterly impossible for her to take any nourishment, she was allowed to have her own way, and accordingly submitted, on those occasions, to total abstinence. In order to indulge her devotion for the Virgin, she caused herself to be transported to the Serra da Piedade, where there is a chapel erected under the auspices of Our Lady of Pity, and she obtained from her spiritual director permission to remain in this asylum. In this retreat, meditating one day on the mystery of the passion, she fell into a kind of ecstasy; her arms grew stiff and were extended in the form of a cross; her feet were disposed in the same attitude, and in this position she remained during forty-eight hours. This was four years ago; and ever afterwards the phenomenon was weekly repeated. She relapsed into her ecstatic attitude on Thursday or Friday night, and continued in a sort of trance until Saturday evening, or Sunday, without receiving the slightest nourishment, without speech or movement."

"The rumour of this phenomenon quickly spread through the neighbourhood; thousands of persons of all ranks crowded to behold it; it was declared to be a miracle; Sister Germaine was regarded as a saint, and two surgeons of the province communicated an additional impulse to the veneration of the people by declaring, in a written document, that her situation was supernatural. This declaration remained in manuscript; but was widely circulated, and numerous copies of it were taken. Dr. Gomide, an able physician educated at Edinburgh, thought it necessary to refute the declaration of the two surgeons; and in 1814 published at Rio de Janeiro (but without his name) a small pamphlet, replete with science and logic, in which he proves, by a multitude of authorities, that the ecstasies of Germaine were merely the effects of catalepsy. In this pamphlet, endeavouring to explain the periodical recurrence of Sister Germaine's ecstasies, Dr. Gomide relates the following fact, which deserves to be repeated. 'A farmer in the environs of Caeté had a number of mules which he every Saturday employed in transporting provisions to the city. These animals, feeding at liberty in the meadows, according to custom, came invariably morning and evening to the house, in search of the rations of maize which were distributed to them at those times. On Saturday, however, the only day in the week on which they were called upon to labour, not only did they abstain from presenting themselves in the morning at the accustomed hour, but made their escape moreover, and concealed themselves in the country.'

"The public was now divided in opinion; but crowds of people still continued to ascend the Serra, to admire

the prodigy operated there. Nevertheless, Father Cypriano da Santissima Trinidade, the late bishop of Marianna, a prudent enlightened man, sensible of the inconveniences which might arise from the numerous assemblies collected by Sister Germaine upon the mountain, and desirous of discrediting the pretended miracle, from which there resulted at least as much scandal as edification, prohibited the celebration of mass at La Piedade, under pretence that permission had never been obtained from the king. Many persons offered Germaine an asylum in their houses; but she gave the preference to her confessor, a grave middle-aged man, who resided in the vicinity of the mountain. The devotees were greatly afflicted at the prohibition of the bishop of Marianna; but they did not sleep; they solicited from the king himself permission to celebrate mass in the chapel of the Serra, and it was granted them. Germaine was now transported a second time to the summit of the mountain; her confessor occasionally ascended thither for the celebration of mass; and the concourse of pilgrims and curious persons was weekly renewed.

"A short time previous to my visit, a new prodigy began to manifest itself. Every Tuesday she experienced an ecstasy of several hours; her arms quitted their natural position, and assumed the figure of a cross behind her back. In the course of my conversation with her confessor, he told me that, for some time, he was unable to explain this phenomenon, until he at length recollected that on this day it was customary to propose to the meditation of the faithful the sufferings of Christ bound. The disinterestedness and charity of this priest had been described to me in glowing colours. I had a long conversation with him, and found him a person not altogether destitute of education. He spoke of his penitent without enthusiasm; professed to desire that enlightened men should study her condition; and almost the only reproach he uttered against Dr. Gomide was, that he had written his book without having seen the holy woman. If what this priest related to me of the ascendancy he possessed over Germaine be not exaggerated, the partisans of animal magnetism would probably derive from it strong arguments in support of their system. He in fact assured me that in the midst of the most fearful convulsions, it was always sufficient for him to touch the patient to restore her to perfect tranquillity. During her periodical ecstacies, when her limbs were so stiff that it would have been easier to break than bend them, her confessor, according to his own account, had only to touch her arm, in order to give it whatever position he thought proper. However this may be, it is certain that having commanded her to receive the sacrament, during one of these ecstatic trances, she rose with a convulsive movement from the bed on which she had been carried to the church, and kneeling down, with her arms crossed, received the consecrated wafer; since which time she has always communicated during her ecstasies. At the same time, her confessor spoke with extreme simplicity of his empire over the pretended saint; attributed it wholly to her docility and veneration for the sacerdotal character; and added, that any other priest would have been able to produce the same effects. With all that confidence which the magnetisers require in their adepts, he observed, that so complete is the obedience of the poor girl, that, should I command her to abstain from food during a whole week, she would not hesitate to comply. He was also persuaded, that she would have suffered no inconvenience from the experiment; but added, 'I fear I should be tempting God by making it.'

"I requested permission to see Germaine, and was conducted into the small chamber where she constantly reclined. Her countenance was visible, though partly overshadowed by a large handkerchief which projected over her forehead; she appeared to be about thirty-four years of age, and in fact this was the age attributed to her. Her physiognomy was mild and agreeable, but indicative of extreme emaciation and debility. I enquired respecting her health, and she replied in an exceedingly feeble voice that it was much better than she deserved. I felt her pulse, and was surprised to find it very rapid.'

"On the following Friday I again visited Germaine. She was in bed, stretched upon her back, with her head enveloped in a handkerchief, and her arms extended in the form of a cross; one of them was prevented by the wall from occupying its proper position, the other projected beyond the bed-side, and was supported by a stool. Her hand felt extremely cold, the thumb and forefinger were extended, but the other fingers were bent, the knees drawn up, and the feet placed over each other. In this position she was perfectly immoveable; and her pulse being scarcely perceptible, she might have been taken for a corpse, if the rise and fall of the bosom in the act of respiration, had not indicated the presence of life. I several times attempted to bend her arms, but without success; the rigidity of the muscles increased in proportion to my efforts, which could not have been more violent without inconvenience to the patient. Certainly, I more than once closed her hands; but on releasing the fingers they resumed their former position. Germaine's sister, who generally attended her and was then present, informed me that she was not always so calm during her ecstasies, as on that occasion; that her arms and feet indeed constantly remained immoveable, but that she frequently uttered sighs and groans, struck her head against the pillow with rapidity, the convulsive movements being most violent about three o'clock, the moment at which Jesus Christ expired."—I. 142.

It was M. de Saint-Hilaire's intention, on ascending the Serra, to try the effect of animal magnetism upon Germaine during her ecstacies; but for this purpose it would have been necessary to have been left alone with her, and this the pious crowds, attracted thither by the fame of her extraordinary trances, would not permit. Nevertheless, having some little taste for juggling, he endeavoured, notwithstanding the presence of several witnesses, to do all he could. His account of what took place is perfectly serious. It is in fact evident he was not wholly without faith in magnetism. Pretending to observe her pulse, he placed his left hand over hers, and bringing his mind into the particular frame required by the magnetisers,—and described by Sterne, when he felt the grisette's pulse in the glove shop,—he practised the usual mummery without effect. However, to preserve the credit of magnetism, he judiciously observes that his attention was perpetually diverted from the matter in hand by the presence and conversation of the company. Subsequently, as is learned from Spix and Martius, the authorities found it necessary to remove the saint from her mountain residence; shortly after which, death came to the relief of poor Sister Germaine, and put a period to her sufferings.

From the circumstances attending this transaction some insight may be obtained into the character of the Brazilians, whose ignorance, credulity, and superstition exceed belief. But their domestic economy, farming, and the treatment of their slaves, complete the picture. One estimable quality, however, they very generally possess; they are hospitable to travellers, and season their cordial reception of the wayfaring stranger with a politeness so unaffected, that, though at variance

with so many practices prevailing among them, it is impossible not to derive from it an inference favourable to their natural character. When contrasted, moreover, with the generality of their countrymen recently arrived from Europe, they appear to some advantage. The latter, from the sketches which M. de Saint-Hilaire has given of them, seem to be distinguished no less by coarseness of manners and want of respect for travellers, than by a degree of ignorance scarcely credible. As a specimen of their rudeness, the author relates, that, on presenting to a respectable merchant a letter of introduction from a mercantile house at Rio Janeiro, he found him stretched out at his ease upon the counter. Without showing him the slightest civility, or making the most ordinary proffers of service, he maintained his position on the counter, while he caused the letter to be read to him. For this inhospitable conduct, M. de Saint-Hilaire endeavours to account in the following manner.—

"The Portuguese merchants, established in those parts of Brazil through which I have travelled, are generally persons of a very inferior class, who commenced business without capital, and in many cases know neither how to read nor write. While the Brazilians heedlessly dissipate what they possess, these Europeans attend to the minutest sources of profit, and condemn themselves to every kind of privation in order to acquire wealth. Their first step is to purchase a negress, who becomes at once their cook, mistress, washerwoman, housemaid, and bearer of wood and water,—tasks which in general the Brazilians impose on their male slaves. In this way they arrive at opulence, but still preserve in the midst of their prosperous circumstances, all the original grossness and vulgarity of their manners, to which the most insupportable pride and contempt for the natives of the country to whom they owe their riches, is commonly superadded." —I. 259.

To the botanist, the merchant, and the agriculturist, the work of M. de Saint-Hilaire possesses more than ordinary interest. His remarks on the cultivation of the cotton plant, the soil which best suits this branch of rural economy, and the numerous impediments which oppose themselves in Brazil to the improvement of its produce, are worthy the attention of our countrymen in the East; who, in this particular, have shown much less perseverance and wisdom than Mohammed Ali. On the culture of the sugar cane perhaps, and several other points of tropical husbandry, the traveller might learn from the English; but all his remarks on these and similar subjects are the fruit of patient enquiry, and even when destitute of novelty, deserve to be examined and regarded with respect.

TRANSLATION FROM THE GREEK ANTHOLOGY.

RUFINUS.

In Reason's breast-plate arm'd I stand,
And fight with Cupid, hand to hand;
Nor shall the Immortal overthrow,
Whilst one to one, his mortal foe.
But vain is all my proud defiance
When Bacchus joins him in alliance,
Then yield I to the fearful odds—
How can *one man* withstand *two gods*?

From the British Critic.

The Darker Superstitions of Scotland, illustrated from History and Practice. By John Graham Dalyell, F. A. S. E. Whittaker: London. 1834.

Mr. Dalyell is extremely well qualified for the work which he has just given to the public, inasmuch as he is not only a distinguished antiquary —the editor of many rare books—but is also, as we gather from his own remarks, a descendant of that renowned general of the same name, who was wont to terrify the covenanters and hold communion with the devil. The dreaded warrior, however, if Scotish legends are to be trusted, did not always quit the society of his supernatural ally without experiencing the hazards which arise from unequal coalitions. Having on one occasion excited the wrath or suspicion of this prince of demons, he found it necessary to seek safety in flight; when, notwithstanding the alertness of his motion, his body lost for ever the power of casting a shadow, even in the most brilliant sunshine. The evil spirit, who failed in his attempt to grasp the corporeal frame of old "Tom of Binns," seized that unsubstantial semblance of him which resulted from the interception of the solar rays; and hence it was maintained by the more rigid presbyterians, that though General Dalyell, by favour of Satan, was impenetrable to musket balls, he was doomed to be for ever unattended by that dark and mimic outline which in a clear day marks the progress of every other human being.

Notwithstanding these preliminary qualifications on the part of the author, this history of the "Darker Superstitions of Scotland" is not a faultless performance. In the first place the composition is extremely obscure, owing to an excessive and ill-timed effort at fine writing. Some sentences, for the reason now stated, are utterly unintelligible. There is an accumulation of long, learned words, which entirely conceal the meaning, and hence, even after a second reading, we have been obliged to pass on, satisfied with a mere conjecture as to the point under discussion. But in spite of this objection, for which we cannot devise any apology, the volume contains much matter that is both amusing and instructive. If the human race may be said to have had an intellectual infancy and childhood, assuredly the belief in witchcraft, spectral illusions, and amulets, belongs to the least improved condition of their social existence. That era, however, in the history of our nature is not to be overlooked. On the contrary, there cannot be any doubt that an authentic view of the manners and customs of mankind may rank with the more valuable parts of literature, because it is obviously of more consequence for us to be made acquainted with the sentiments, habits, opinions and occupations of our ancestors, than to peruse the most minute record of their savage wars and rude diplomacy.

It is not to be imagined that the superstitions of Scotland differ in any important particular from those of other nations at the same stage of improvement. They are, however, better known than the similar reliques of England and the

Green Isle, from the circumstances we are now about to mention. In the first place, the belief in diabolical agency retained its power over a large portion of Caledonia till a comparatively recent date; little more than a century having passed since witches were legally condemned to death in the extreme north, after a patient examination of the most circumstantial evidence. In the next place, as the clergy took cognisance of all crimes said to have been committed at the instigation or by the aid of the Evil One, their parochial registers have preserved a detail of cases which we should elsewhere look for in vain. The "Statistical Account of Scotland" too, which comprehends an outline of the superstitious notions still lurking in many parishes north of the Forth, affords an abundant supply of materials to the historian of popular credulity. It is from such sources, as well as from the records of the justiciary court, that Mr. Dalyell has drawn the immense mass of facts with which his pages are crowded: and he tells us that much curious matter still remains in the same repositories, especially in those belonging to the kirk.

The first chapter respects the "Evil Eye," and the consequent invocations and maledictions. It is justly remarked, that among the numberless superstitions enthralling mankind, no one has been more extensively diffused throughout all countries, and in every age, than belief in the injuries which may be inflicted by a malignant glance. In the classical authors of Greece and Rome we find frequent allusions to this power of the eye; and it is mentioned in the Records of Orkney, the Ultima Thule of civilisation, that the devil taught Janet Irving, if she bore ill-will to any body, "to look on them with open eyes, and to pray evil for them in his name, and that she should get her heart's desire." James I. too, in describing what he is pleased to call the "Devil's Rudiments," mentions the various kinds of charms "which daft wives use for healing fore-spoken goods, and for preserving them from evil eyes;" and among these he enumerates the roun-tree or mountain ash, and an assortment of sundry herbs. Every nation upon earth acknowledges this malign influence, under expressions synonymous with that now specified, such as *overlooking*, *eye-biting*, or *fascination*. A certain woman tried at Youghall, in Ireland, for bewitching Mary Langdon, denied the fact, though she admitted at the same time that she might have *overlooked* her. Between these, she said, there was a great difference, for, unless by touching her, she could not have done her any harm; wherein Glanvil, the author of "Sadducismus Triumphatus," remarks, "how overlooking and bewitching are distinguished by this hellish fraternity, I know not."

Most of the opinions entertained by the moderns in regard to fascination may be traced to the highest antiquity. Aristotle speaks of a Thessalian female who attracted a poisonous serpent within a magical circle drawn round her, when it instantly became lifeless. The faculties of the Psylli, or charmers, enjoy great repute even in our own times. Plutarch engages in a question "concerning those who are said to fascinate," and concludes by allowing the existence of such a power. "It is known," says he, "that friends and servants have fascinating eyes; and even fathers, to whose protracted gaze mothers will not expose their children." The ancients seem to have contemplated it as among the vices of the heart, originating for the most part in envy. It is affirmed that even at this day, in the Levant, passengers are invited by the lowest of the people to partake of their fare, lest they be "observed by a hungry man who envies the morsel." Formerly infants were considered very sensible of the "irradiations of the eyes." They were reluctantly submitted to the gaze of strangers; and in Spain an invocation of the Deity was employed to avert the consequences. At present, we are told, in the Spanish colonies, a similar prayer follows the commendation of a child, or of a young animal; and there also a widow is apt to ascribe the loss of her husband to the evil eye of one of her own sex. It is stated by Caldcleugh, that many years have not elapsed since a young woman was burnt alive for having set evil eyes on a sick person, and a female relative found it necessary to fly, under terror of the same accusation. In Egypt, the livid hue, the yellow skin, and the emaciated frame of a sickly child, is by the mother usually ascribed to an evil eye. In the northern parts of Africa, too, the natives dread an expression of admiration when directed to any of their family, or even to any valuable article, whether animate or inanimate. At Tripoli, the death of an infant was attributed to the steadfast gaze of a stranger, who was struck with its beauty as it lay in the cradle. No Christian in those parts is permitted to embrace, or even to look upon a babe. The same apprehensions as to the evil eye are held by the Jews, Greeks, and Turks, who possess the several islands of the Archipelago. When the goodness or beauty of any object is commended, it is incumbent to add, "God preserve it;" and the Greeks are further accustomed to blow a little saliva upon it, by way of an antidote. Mr. Dalyell states, as a proof of this superstitious feeling being not yet quite extinct in Scotland, that only a few years ago, a domestic in his family having died of small-pox, then believed to be extirpated from the place, his mother, on arriving from a distant part of the country, expressed her conviction that he had fallen a victim to an evil eye.

It must have occurred to every reader of such books as the "Darker Superstitions of Scotland," that a person suspected of this fascinating influence was very likely to be betrayed into the belief of really possessing it. The fears of others, and the occasional coincidences between a spiteful look and an unlucky accident, would naturally tend to confirm the impression on the mind of a weak woman, that her eye was armed with more than human powers. The alarmed imagination of the credulous peasant, whose health or life seemed to depend upon a vindictive glance, would, in many cases, realise the very evils which were apprehended; and hence the wrinkled hag who had not wit to procure herself a livelihood, might be induced to conclude that she had become the mistress of a most tremendous supernatural agency,

and had thereby the fate of her fellow-creatures placed in her hands. There cannot be any doubt that the reputed witch has generally derived all her might from the weakness of those around her; and that her first aspirations after the unhallowed faculties which are supposed to distinguish her class, was suggested by the terror or suspicion with which she saw herself regarded. But says the author—

"Is there truly any rational foundation for that confidence which has been universally expressed in the subsistence of fascination? Does the presence of an object unseen produce an irresistible impression? Or does it reside in the imagination only? This enquiry might lead to interesting disquisitions. Perhaps, if fascination exists, its principle must be sought in some natural cause operating in such a manner on the person as to occasion disturbance of the mind. Doubtless certain sensations originate from the presence of objects which never meet the eye. Our senses are not sufficiently refined to detect of themselves the elements, finding an invisible channel of transmission, though they may be discovered and arrested by foreign auxiliaries. Does not infection spread through the medium of a vehicle absolutely invisible, and after a mode unknown and imperceptible by the most delicate sense? The sight, the hearing, and the feeling may be rendered more acute; they may become obtuse; all the faculties may be lulled into languor, and the sleep of death extinguish them for ever, while the agent escapes the keenest search of human scrutiny. . . . At certain seasons penetrating emanations from the animal and vegetable world occupy the atmosphere, surely for the conservative or destructive designs of nature. The reciprocal influence of living beings on each other, though far asunder, is decided, though the medium of communication be unknown: domesticated animals of prey, and those employed in field sports, illustrate to mankind in society, what is advancing constantly in the natural state. Thus quadrupeds, birds, even insects, seem to be paralysed for the moment by some hidden external impression, never to be discovered but by the demonstration of its effect; for the means of detection are not enjoyed by men. Whether it be in stimulating effluvia, whether in a narcotic vapour, or in some other quality indescribable, nothing is established better than the transmission of impressions through invisible means. Sympathy and antipathy, so familiar by name, yet so little understood, are alike inexplicable. If the attraction and repulsion of inanimate matter yet elude explanation, it may be safe to conclude that the combination of physics and ethics has been insufficiently appreciated in hypotheses on the cause of sympathetic affections."

The philosophy of this passage is rather obscure, and throws very little light on the dark subject of fascination. Among the lower animals, the effect produced on their nervous system may, generally speaking, be ascribed to terror. The eye of a powerful enemy deprives them of voluntary motion, and they appear unable to remove from the object which of all others their natural instinct would lead them to avoid. There is nothing, we presume, analogous between the principle of infection in a corrupted atmosphere and the influence which darts from a potent eye; they agree in nothing except the difficulty of being explained.

Maledictions and invocations too, may be justly described as producing their effects through the medium of a startled fancy. It is true there are many cases on record where the curse was not heard by the party most interested; but in these it would not be easy to trace any connection between the "devilish prayer" and its supposed consequences. The incantations of Joan of Arc, for example, threw the English soldiers into such a state of superstitious alarm, that, although on their own side of the channel, many of them deserted from the army, or refused to join. No one, however, will maintain that her imprecations would have deprived the stout peasant of his natural courage, had his imagination not been preoccupied with visions of her ghostly power. It was, indeed, a principle in the Roman law, that "magical muttering might destroy mankind." "Eadem lege et venifici capite damnatur qui artibus odiosis tam venenis quam susurris magicis homines occiderunt." In Scotland the death of cattle and sheep was ascribed to those who were known to have "prayed evil" against the owners, and it must be confessed that some of their execrations were bitter in the extreme; Isobel Grierson, for instance, whose reputation was impeached, "spak mony devillisch and horribill words," saying to the neighbour by whom she was offended, "the faggots of hell light on thee, and hell's caldrane may thou seethe in; and with these and other the like devillish speches she passed away."

Among the superstitions mentioned by Mr. Dalyell, is the notion which prevailed all over Europe, that the corpse of a murdered person would bleed upon being touched by the hand of the individual who had taken away the life. This test proved on many occasions a fatal snare for the innocent. For example, four men having been drowned during fair weather, a woman suspected of changing herself into a porpoise, that she might overset their boat, was desired to touch their bodies some days after the accident. One of them, we are assured, bled at the collar-bone, and another in the hand and fingers, "gushing out blood thereat, to the great admiratione of the beholders, and revelation of the judgment of the Almychtie." King James, in his "Demonologie," proceeds on the assumption that the guilty were sometimes convicted by miraculous evidence. "In a secret murder, if the dead carkasse bee at any time thereafter handled by the murtherer, it will gush out blood; as if the blood were crying to the heaven for revenge of the murtherer, God having appointed that secret supernatural trial of that secret unnatural crime."

In the year 1688, Sir James Stansfield, having been found dead in a stream, was buried precipitately. After being two days in the grave, his body was raised, and partially dissected; and the neck in particular was laid open, in order to ascertain the cause of death. After being well cleansed, blood burst from the side which was supported by his son Philip, as they were returning the body to the coffin for a second inhumation, and the hand of the young man was stained. This occurrence, so likely to arise from straining the incisions while moving the corpse, excited suspicion against the heir, and he was in due course of law arraigned as a parricide. In the course of the procedure which followed, great stress was

laid on the fact now mentioned; it was even argued that this peculiar incident denoted the disclosure of an occult crime under the direction of Divine Providence.

The royal author maintained, that if the "carkasse be at *any time thereafter* handled by the murtherer, it will gush out blood." An instance tending to confirm this opinion is said to have occurred in the reign of Charles I. when the minister of a parish testified that the body of a woman, suspected to have been murdered, was taken out of the grave thirty days after her death, and laid on the grass. The prosecution in this case was at the instance of a son of the deceased against his own father, grandfather, uncle and aunt; and these four defendants, being required, touched each of them the dead body, whereupon, says the narrative, the brow of the defunct, which was before of a livid and carrion colour, began to have a dew or sweat arise on it, which increased by degrees till the sweat ran down in drops on the face; the brow turned to a lively and fresh colour, and the deceased opened one of her eyes, and shut it again three several times; she likewise thrust out the ring or marriage finger three several times, and pulled it in again, and the finger dropped blood on the grass. Three of the four accused were convicted of the murder.

On some occasions the mere presence of the guilty person, even without his coming in contact with the deceased, was thought sufficient as a test; nor was it necessary that life should have been taken away by actual violence to constitute the crime. Janet Randall, it is related, was sent for by a man who imagined she had bewitched him, but he expired before her arrival. He had, however, "laid his death on her:" and "how soon as she came in, the corpse having lain a good space, and not having bled any, immediately bled much blood, as a sure token that she was the author of his death."

It is not improbable that the origin of this superstition may be sought in the misapplication of a passage of Scripture—"The voice of thy brother's blood calleth unto me from the ground;" and so vehement were the prejudices of our progenitors, that little further evidence of guilt was demanded. What, indeed, could equal the interposition of the divine decree in pointing out the offender? Yet the truth of this test was disputed among the continental lawyers, as it must have been rejected by all intelligent men; for those who credit marvels merely because habituated to the narrative of them, or because others credit them, are not to be esteemed intelligent men. Lawyers recommended that the body of the deceased should be presented before the suspected murderer in chains, to discover whether he should manifest any agitation, or whether the blood flowed from it before him. Scribonius advances his own testimony in corroboration of the success of this test. A nobleman of Arles, whom he names, having been mortally wounded, blood burst from the wound, and from the nostrils, after decease, immediately on approach of the offender. Hippolytus of Marseilles declared his incredulity until a murder was committed by a person unknown, during his magistracy of a town in Italy. He directed the body to be brought to him, and summoned the attendance of all suspected persons. The wounds began to bleed on the approach of the real murderer, who soon after confessed the fact. Matthæus, however, considers the test so fallacious, as to be an insufficient reason for putting one suspected to torture for eliciting the truth. Carpzovius also, another lawyer of repute, relates that it was established from proof transmitted to his court, that a corpse had bled before an innocent person, though not a drop of blood escaped before the guilty. Nevertheless he had considered the bleeding of a wound or of the nostrils enough to warrant the application of torture. By the custom of Germany, as explained in a learned treatise, the suspected person put two fingers on the face of the deceased, then on the wound, and afterwards on the navel, in presence of a priest, who adjured him to appeal to heaven.

There is a long chapter on "occult infection and cure of maladies," as well as "on miscellaneous remedies and antidotes to disease;" but the industry of the learned author has not collected any thing either new or striking on these interesting heads. The traditions of all rude countries abound with instances of miraculous cures, accomplished by the use of very inadequate means, or without any visible means whatever. The efficacy of water, especially if running towards the south, of salt, and of saliva, holds a distinguished place in all such fabulous narratives. A fountain beside the chapel of Crayquerrelane, on a hill at Lochgrevion, was frequented for various distempers; and "sundrie and divers multitudes of men and women from all countries," we are informed, "doe conveen and gadder togidder to this chapell in the spring tyme, one day before St. Patrick-mass-day; and drinking every one of them of this spring and fresh water, alleadges that it shall recover them to their healthes againe, and uses the same yearlie. Once a tyme in the yeare certaine of them doeth come for pilgrimages, and certaine others in respect of their sicknesses bygone, of the which they have recovered their health; and certaine of them for their sickness present; and so they are persuaded to be restored to their healthe by the help and assistance of that holie saint and drinking of the waters that is to be had there, on the high craig and rough place."

We learn that the veneration anciently entertained for fountains still continues to be cherished in some parts of Scotland. St. Fillan's well, in the county of Perth, is visited on the first of May and on the first of August, when valetudinarians encircle it thrice, and drink the water or bathe in it. Votive offerings of rags or linen cloth are left at the well, and a stone is cast on the saint's cairn. In general such places were resorted to on the first day, or first sabbath in the month of May, in reference, no doubt, to that primitive festival when honours were paid to the sun as the principle of fecundity and the giver of good things. The pilgrims, as is usual in such cases, were principally women. Grizel Richardson, when taxed with superstitious practices, confessed that "through her great sickness and infirmities she sent Margaret Tailyor to Christ's well, to fetch her a pynt of the watter thereof." And

the latter acknowledged that "she went there on the first Sunday of Maij instant, and fetched to her a pynt of watter forth of the said well, and offered upon a trie one piece of the said woman's heid-muche (head-cap) that sent her, and that she gave two-pence to the poor folk in her name."

We have just alluded to the rites performed in veneration of the solar deity at the opening of the summer months, the remembrance of which is still kept alive by the use of sundry terms, such as Bel-tein, or Bel-tane. It is presumed that the Scotish Moloch, not less than the Canaanitish, delighted in the effusion of human blood; and hence that certain innocent ceremonies, still practised in the north, may indicate to the comprehension of the learned the great probability of human immolations in the darker ages of our history. But whether this conclusion be sound or not in regard to that most horrible of superstitions, it is indisputable that analogies to a propitiatory offering for the safety of flocks and herds may be discovered in later eras, observed too at a period of the year precisely corresponding to the festival in question. On the first of May, it is recorded, the Highland herdsman prepared an oaten cake, with nine square knobs on the surface. Each of these, dedicated either to a conservative or to a destructive being, was broken off and thrown over the shoulder, accompanied with an invocation for security to his charge, during the season. Rudbeck likewise found the relics of sacrificial rites in the particular form of some varieties of bread, baked at a certain period of the year in Sweden. Another ceremony, which is hardly yet discontinued, is more worthy of our notice. At Bel-tine, the yearly feast of Baal or Bel, the Caledonian youth were wont to cast a trench in some sequestered spot among the hills. A fire was then kindled, and a cake being made and cut in pieces, one of these fragments was blackened, and the whole put into a bonnet. In the next place, each of the striplings present drew forth a portion; and he to whose lot the blackened piece chanced to fall, was held as devoted to Bel-tine, or Baal's-fire, as a sacrifice. To discharge the obligation thus laid upon him, the victim was obliged to leap three times through the fire which had been used in the preparation of the mystical cake; but the life was spared; the youth was only sacrificed symbolically, at least in later ages.

It is not improbable that a similar reference was made to some part of an ancient ritual, in the observance now to be mentioned. After an infant newly baptized was carried home from church, the midwife, or another, waved it through the flame, repeating thrice, "Let the fire consume thee now, if ever!" The author adds, that even in the present age, a child, put on a cloth spread over a basket containing provisions, is conveyed thrice around the crook of the chimney, thus, as he remarks, "preserving the proximity of fire." In short, the recognition of the pagan divinity, Baal, may still be discovered in Scotland through innumerable etymological sources. In historical records, down to the sixteenth and seventeenth centuries, multiplied prohibitions are found against *Baal-fires*, which the people were so much disposed to kindle. Mr. Dalyell asserts that the festival of this divinity was commemorated in his country "until the latest date;" and he adds, "should it have been ever truly interrupted, the citizens of the metropolis seem willing to promote its revival in recollection, by ascending a neighbouring hill, Arthur's Seat, in troops, on the first of May, to witness the glorious spectacle of sunrise from the sea." In Ireland, a country less advanced, and thence more tenacious of ancient customs, it was remarked, late in the preceding century, that when "fire is at this day kindled in the milking yard, the men, women, and children pass or leap through it." The ecclesiastical councils, indeed, found it incumbent upon them to enact various canons against leaping over fires kindled at new moon.

There cannot be any reasonable doubt that a variety of propitiatory offerings were made by the ancient Scots, some of them with the view of recovering lost health, and others with the intention of securing the goods which had fallen to their lot. A person who had lost many of his cattle, as he imagined, by witchcraft, burnt a living calf, to break the spell and save the remainder. Another, whose sheep had perished in great numbers, was advised to "take a beast at Allhallow eve, and sprinkle three drops of the blood of it by the fire." It seems to have been universally believed, that a disease could be transferred from one human being to another, and even from mankind to the lower animals. A woman accordingly, who was suspected of having relieved herself at the expense of a neighbour, urged, in her own defence, that "if William Bigland lived, she would die, therefore, God forbid."

Besides propitiatory sacrifices, there were also propitiatory charms, which, though extremely superstitious, were in general less cruel. The former proceeded on the ground that life was required for life; that exemption from suffering and death must be purchased by the endurance, either actually or by symbol, of the evils which the supplicant wished to remove from himself, his family, or his flocks; and that in most cases a substitute would be accepted in place of the victim whom the Spirit of Evil had marked out for loss or destruction. The latter notion seems to have implied the belief that the mischievous devices of the invisible enemies of man might, by the use of certain expedients, be counteracted, or rendered innocuous. The charms were sometimes extremely simple, and even approaching to the ridiculous. In the indictment of Elizabeth Bathcat, it was stated that she had a horse-shoe in a secret part of her door, kept by her thereupon as a "devillisch means and instruction from the devil," to make her goods and all her other affairs to prosper and succeed well, especially within her house. John Feane was convicted of using, by way of witchcraft, moles' feet, given to him by Satan, kept in his purse; "for this cause, that so long as he had them upon him, he should never want silver." Sir James Melvil affirms of the Earle of Bothwell, that he required the aid of Richard Graham, to cause the king's majesty, his master, to like well of him; "and to this effect he gave the said Erle some drug or herb, willing him at some convenient

time to tuiche his maister's faice therewith." But the device did not succeed. Poor Ritchie Graham appears to have been a very unfortunate necromancer, for he was strangled and burnt, on its being proved that he had been consulted by Barbara Napier as to her son's health, and "whether the king should return from Denmark."

It should seem that all the powers of the air, as well as the bad spirits which became the familiars of man, were moved by the bold enterprise of the Scotish monarch, when he crossed the sea to bring home his Danish bride, in the year 1590. His subjects, generally, did not dislike the match, but the sorcerers of both kingdoms, probably in revenge of his learned labours on the principles of their art, employed themselves on either shore of the northern ocean, to raise tempests against him. Accordingly, while all the rest of the fleet had a favouring gale, the course of the royal couple is said to have been interrupted by violent storms. The ship conveying the queen sprung a leak, and several other vessels were actually lost on different parts of the coast. The conjurations practised for this purpose are described as follows: Agnes Sampson, Janet Campbell, John Feane, Geilie Duncane, and Meg Dyn, baptesit a cat in a webster's house, in this manner. First twa of them held a finger on one side of the chimney cruick, and anather held an uther finger in the uther side, the twa nebbs of their fingers meeting together. Then they put the cat through the links of the cruick, and passit it thrice under the chimney. Thereafter, at Beigie Tod's house, they knit to the four feet of the cat four joints of men; quhilk being done, the said Janet fetchit it to Leith; and about midnight she and the twa Luikehops, and twa wifes callit Stobeis, came to the peir-head, and saying these words: "see there be no deceit among us," they cast the cat into the sea sa far as they myght, quhilk swam oute, and came againe; and they that were in the panis, cast in another cat into the sea at xi hours, after quhilk, by their sorcerie and enchantments the boat perished between Leith and Kinghorne.

It appears from a far better authority than the one now referred to—the trial of Agnes Sampson—that such an accident happened at the period in question, and was ascribed to the malice of Satan. He had promised to John Feane "to raise a mist and cast the Kinge's Majestie in England; and for performing thereof he took a thing like a foot-ball, which appeared to the said John like a wisp, and cast the same into the sea, quhilk causit a vapour and a reek to rise."

Mr. Dalyell proposes the question, "whence did the previous generations inhabiting Scotland derive their precepts for the practice of sorcery?" He is satisfied that the fertility of their resources, their diversified, empirical prescriptions, their sacrificial relics, their varied divinations, and their confidence in the existence of imaginary beings, did not spring from their own simple invention. It is admitted that, in the multiplied judicial proceedings which occupy the Scotish records, there appears occasionally a transient investigation of the source whence the delinquent obtained necromantic powers. Satan's presence, instruction, and deportment are frequently alleged; nor are they ever called in question, as no one doubted them. Whatever guise he assumed in such dealings with mankind, and whatever was their purpose, they were credited not only by the unhappy victims of self-delusion, but also by their merciless persecutors; by those whose eyes the love of justice and of mercy should have opened. At all events, it is manifest that he assumed a variety of forms, and adopted a great diversity of methods in communicating his bad lessons. For example, the tuition of one who practised successfully during fifty years, was derived from a "familiar spirit attending him, to give him instruction" in all his cures. Another obtained his skill from Satan "in the likeness of a corbie," or raven. Agnes Sampson acquired her skill and her prayer from her father; Janet Stewart, from her father and an "Italian stranger;" Marion Fisher, "an ordinary charmer," was taught in her youth by a reaper; and another was instructed by a "going man." But others are said to have undergone a kind of regular instruction in the necromantic art. Thus, the indictment of one, brought to the bar, specifies that "Catherine Campbell, the witch wife, dwelling in the Canongate, causit another witch wha dwelt in St. Ninian's Row, to inaugurate you in the said craft, with the girth (hoop) of a great bikar, turning the same oft over your head and neck, and oft times round about your head." John Burghe was alleged to have obtained his knowledge "from a widow woman, named Neane Nikelrith, of three score years of age, wha was sister's daughter to Nek Neveing, that notorious infamous witch in Monegie, quha for her sorcerie and witchcraft was burnt fourscore of years since, or thereby."

The maxim of the ancient sceptics, that "fear first made gods," may be applied with perfect confidence to all classes of sorcerers, wizards, and witches. As the practice of their supposed art was gainful, a motive was created for perpetuating the delusion. Gifts poured in upon the old women who were believed to hold traffic with the worst portion of the invisible world, as well with the view of purchasing their favour, as of disarming their resentment. They were regarded, too, with a feeling of awe approaching to veneration; and every one was careful not to mention their names, but with the semblance of the most profound respect. These advantages, coupled with the love of power, natural to the human heart, counterbalanced the hazard of a legal prosecution, and of a violent death at the hands of public justice.

It must, however, be acknowledged that it would require nerve in any one to encounter the imputation of witchcraft; for, of all the dark parts of Scotish superstitions, the mode of detection, or the mode of punishment adopted by the judges, was the most terrific. One of the commonest methods for ascertaining whether an old woman was in compact with Satan, was to thrust a bodkin or needle three or four inches into the muscular part of her body. If she felt pain, the case was pronounced doubtful; if she appeared insensible, she was condemned to be strangled and burnt. The ordeal by water was, if possible, still more iniquitous and cruel. The thumb of

the right hand was bound to the great toe of the left foot, and the thumb of the left hand to the great toe of the right foot, and retained by a cord; the victim was then cast "crosse wayes" into "a river or lake;" if she sink, she is counted innocent; if she float, and sink not, she is taken for a witch. It was inferred that Satan, being light, or having a small specific gravity, sustains them in the fluid. The *witch-pool*, and the *witch-lake*, are accordingly still pointed out in various parts of North Britain.

"Though privation of sleep be described as 'the choicest means they use in Scotland for the discovery of witches,' it was not restricted to them only; for after other expedients for detecting a conspiracy had failed to obtain confession, the commander of the forces was enjoined to employ the most trusty officers and soldiers to 'watch Mr. William Spence, by turns, and not to suffer him to sleep by night or by day, and for that end, to use all effectual means for keeping him still awake.' Another was withholden from sleep 'to the great perturbation of his brayne.' By means of torture, picking, watching, and keeping several women from sleep, James Gillespie, minister of Rind, and some coadjutors, were charged with having obtained false confessions, whereon the innocent had suffered death. Several also, under a guard of drunken fellows at Pittenweem, were kept days and nights awake, which cruel usage made some of them to be so wise as to acknowledge every question that was asked of them, whereby they found the minister and baillies well pleased, and themselves better treated. One was kept five days and nights awake by continual pricking, to the great effusion of her blood; and this kind of torture is alleged to have been protracted even to nine nights."—"Humanity and justice were outraged in the combinations of torture inflicted on the miserable objects of suspicion. Aleson Balfour, in Orkney, confessed certain allegations of witchcraft, but only 'be vehement tortour of the *caschielawes*, quharin she was kepit by the space of forty-eight hours:' nor did it come of her own sufferings only, for her aged husband, her eldest son, and daughter, were all in her presence 'put in tortour' at the same instant time, the fader being in the *lang irnes* of fiftie stone weight; the son driven into the *boots* with fifty-seven strokes; and the daughter, being seven years old, put in the *pinnywinks*, to the effect that being so tormented beside her, might move her to make any confession for their relief. When condemned and led to execution upon the *heading-hill* of Kirkwall, in 1594, this unhappy person declared herself 'as innocent, and would die as innocent of any point of witchcraft as a bairne unborn.' Yet this was not enough to the tormentors, for, on the parson of Orphir asking whether she would abide by her first confession, she returned the following impressive explanation: 'that she was then tortourit divers and several times in the *caschielawes*, and sundry thymes taken out of them dead, and out of all remembrance either of good or evill; as lykewayis her good-man being in the *stokis*, her son tortourit in the *buitis*, and her daughter put in the *pinnywinkies*, quhairwith she and they wer so vexed and tormentit, that pairtly to eschew a greater punishment and torment, and upon promise of her life and guid deidis by the said parson, she falsely against her soul and conscience made that confession, and no other wayis; for the quhilk she asked the Lord mercy and forgiveness,' and then patiently submitted to her fate. Can a scene of greater atrocity be pictured! The torture of those most dear to the spouse and the mother before her; a clergyman violating all sanctity and morality, endeavouring, under treacherous pledges, to elicit the confession of impossibilities."

The only alleviating consideration which can present itself to the reader of these "Darker Superstitions" is, that the persons employed in the several processes of conviction and punishment were sincere. They believed in the crime, dreaded the numerous evils which resulted from it, and, of course, saw their duty in checking its increase throughout the land. In this eagerness of detection the clergy acted a principal part, and even, on some occasions, allowed their zeal to outstrip both humanity and prudence. In 1607, a commission to seize and try certain persons was refused by the privy council, "considering," to use their own words, "the many inconveniences and the exceeding great slander which had arisen by the bypast trial of witches, by ministers who carried professed sorcerers with them to the parish kirks, and made them judges of the honesty or guiltiness of men and women, undefamed before, and who were brought in question of their honesty, life, and geir (goods), and made to be convicted and punished to the death." Through the credulity of the minister of Glasgow, it is added, divers innocent women suffered, from one venturing to affirm that all the proselytes of Satan had a certain mark in the eye whereby she could discover whether they were witches or not. Imbecility of judgment, and love of dominion, promoted persecution. The kirk-session, "tyrannical in arrogance," as Mr. Dalyell expresses it, employed spies to ferret out the history, life, and manners of each individual. Some of their number, who got the name of *searchers*, made an inroad into private dwellings on Sunday; or, without warning, broke open any door, under cloud of night, during the week. They imposed fines, and inflicted exile; the prisons were filled with delinquents, and the places of public repentance were crowded to such a degree that they could receive no more penitents. On one occasion, the kirk-session of Holyroodhouse threatened to drown a woman, suspected as the parent of an illegitimate child, if she ever again appeared within the bounds of their jurisdiction.

In such proceedings we detect ignorance, intemperate zeal, narrow-mindedness, and the most intolerable despotism; but in the darker superstitions of Ireland we may perceive something more —even fraud combined with credulity. About ten years ago various miraculous cures were said to have been effected in that country, through the intercession of Prince Hohenloe, and were vouched by the highest ecclesiastical authority in the land. The most remarkable of these is reported to have taken place in the convent of Ranelagh, in the immediate vicinity of Dublin, and on the person of Miss Mary Stuart, a member of that establishment. Dr. Murray, the Roman Catholic primate of Ireland, recognised the miracle; and in a pastoral address, published immediately afterwards, remarks, that the "voice of these facts, issuing from the bosom of his sanctuary, and publishing the glory of God with the loudness of thunder, may strike upon the ears and hearts of many to whom the voice of our ministry could not reach." Then he proceeds to the facts in the following terms:

"Mary Stuart, of the convent of St. Joseph, Ranelagh, has, through the extraordinary interposition of that Om-

nipotent Being who killeth and maketh alive, been restored instantaneously to health, from a state of grievous and hopeless infirmity, for the relief of which all the resources of human skill had been expended in vain. The account of this wonderful case reached us officially on the 2d instant, in a letter from Mrs. Mary Catherine Meade, prioress of St. Joseph's convent, under date of the preceding evening. This communication stated in substance that one of the religious sisters of that community had been afflicted with sickness for four years and about seven months; that during that period she had frequent attacks of paralysis, each of which seemed to threaten her with immediate dissolution; that the most powerful remedies had been applied without producing any other than partial and temporary relief; that for several months past she had been confined to bed, wholly deprived of the power of assisting herself, or of moving out of the position in which she was laid; that when moved by her attendants, how gently soever, she not only suffered much pain, but was also liable to considerable danger and to the temporary loss of speech; and that for the last five weeks she had entirely lost the power of articulation; that up to the morning of the first instant she continued in this deplorable state, without any symptom of amendment, and apparently beyond the reach of human aid—that on a certain hour that morning, as had been settled by previous arrangement, she united her devotions (as did also her numerous friends) with the holy sacrifice of the mass, which was to be offered by Alexander, Prince Hohenlee, in the hope of obtaining immediately from God that relief which no human means could afford—that with this view she received, though with much difficulty, the divine communion at the mass which was celebrated at the same hour in her chamber for her recovery—that mass being ended and no cure yet effected, she was in the act of resigning herself with perfect submission to the will of God, when instantly she felt a power of movement and a capability of speech—that she exclaimed with an animated voice, 'Holy, holy, holy, Lord God of hosts!' raised herself without assistance to offer on bended knees the tribute of her gratitude to heaven; called for her attire, left that bed to which she had been for so many months as it were fastened, walked to the convent chapel with a firm step, and there, in presence of the community and congregation, joined her religious sisters in the solemn thanksgiving which was offered up to God for this wonderful and manifest interposition of his goodness."

These facts were laid by the archbishop before the Roman catholic priesthood and laity of Dublin, and pronounced by him as constituting a miracle of the most positive and regular description. To establish his testimony he subjoins certificates from several medical gentlemen, with affidavits from five religieuses of the convent, and two clergymen who officiated on the occasion. As might be expected, a deep and solemn impression was produced on the multitude; and every exertion was made to extend and confirm it. Dr. Murray's letter was widely circulated: it was hawked about at the cheapest rate, and in such shapes as to catch the vulgar attention. At last, the convent itself was thrown open, that all who chose might hear from Mary Stuart's own lips, the detail of her complicated sufferings, succeeded by the account of her miraculous restoration to health, and concluded by the ardent attestations of her religious sisters.

Now, we are willing to take the facts as they are recorded, without subjecting them to that minute examination which the use that was made of them would amply justify; and yet, coupling them with the obvious import of the medical certificates issued on the occasion, we would assert not only that there was no miracle in Miss Stuart's partial recovery, but that every man of common sense must have been aware, that the change produced upon her nervous condition by the exciting ceremony in which she had been engaged, was strictly within the bounds of nature. She had, it is true, been long an ailing person, and subject to "various nervous affections of an anomalous kind;" but she was, we maintain, on that very account the more likely to be roused to a temporary vigour of body by a stirring action on her mind. It is generally known that, of the numbers who came to St. Fillan's well—a celebrated fountain mentioned by our author—some returned every year either completely cured or very much relieved. The effect of the water, the vigils, and the excitement, however, in this case, as in Miss Stuart's, was exclusively confined to those whose nerves were diseased, and who, like her, were "subject to stagnations." Other holy streams and consecrated buildings were regularly frequented at the proper festivals by individuals who suffered under such affections; and the success, it is well known, was so great, and the confidence of the ignorant people so strong, that the presbyterian ministers found it necessary to take down the old walls, to lock doors, and to cover up the crystal current from the approach of the superstitious.

But, in point of fact, the cure of Miss Stuart was not complete. She had, indeed, recovered in some measure the use of her limbs; and the symptoms of the principal disease with which she was afflicted were to a certain extent mitigated, after the moving scene of the first of August. Still, so far from walking with a firm step, as the archbishop was taught to say, she moved like a person whose legs were weak and feet sore. She passed from one side of the room to the other with an evident effort and an unsteady pace—like a patient, in short, who was enjoying a brief respite from a chronic rheumatism. Three medical men were desired to visit her on the fourth of August, three days after the supposed miracle, to examine into the state of her health, and they report that she assured them "she was without complaint." She added that she had not walked in the grounds of the convent owing to a *degree of weakness* in her limbs, of which, however, she appeared to have the free use. They found her pulse at 120, a clear proof that the prayers of Prince Hohenloe had been blessed with but a very partial success: and of four issues which had been long established, three might be considered as healed, being without dressings, though the one "in the left arm was open and freely discharging, having made no progress in healing." One of the physicians was afterwards required to give a categorical answer to two questions put to him by a clergyman on this interesting matter. He replies—

"I felt it necessary to see Mr. Mills and Mr. M'Namara before I could answer your letter of the 20th. Considering that the friends of Mrs. Stuart might not think it expedient to publish our certificates relative to the state

of her health, we resolved not to give any opinion on the subject, and not in any way commit ourselves individually. These certificates having been published, I have in consequence of your letter waited upon Dr. Mills and Mr. M'Namara; and as they leave me to the exercise of my own discretion, I can have no hesitation in answering your questions. To the first I reply, that there was not, in my opinion, any thing miraculous in the change which took place in Mrs. Stuart's health. To the second, that her case can, to my entire satisfaction, be accounted for on natural principles."

It is worthy of being noticed, as affording the means of judging how much depended on the workings of Miss Stuart's own mind, that Prince Hohenloe had performed at Bamberg all the requisite ceremonies for the restoration of her health; but as she had not received information of his doings, she derived no advantage from them. This fact seems to prove that the co-operation of the patient is absolutely indispensable. The miracle, however, was held altogether beyond question by the Roman catholics of Dublin, who, with their archbishop, were determined to see in this very ordinary event the finger of Divine Providence marking out the superiority of their communion.

"These tangible manifestations," say they, "of the favour of Heaven to a particular individual and a particular church, are not, be it remembered, of bygone times, or of distant countries; they are contemporaneous with ourselves, and exhibiting themselves to our eyes, they are subject to our personal investigation. Verily, these things appear to us with such force and frequency, that to account for their occurrence on natural principles will puzzle the ingenuity of scepticism."

Surely these pious persons must have forgotten the numerous miracles performed at the tomb of the Abbe Paris, the greatness and popularity of which demanded at length the interposition of the civil authorities. In that case, indeed, the process by which the nervous disorders were removed, or changed, was more obvious, and indicated more distinctly the operation of a natural cause. The cure at Ranelagh was effected in secret, not, perhaps, without a certain preparation both in the patient and the witnesses; and it is only those who, like Dr. Cheyne, were acquainted with the anomalous symptoms of her complaint, who could trace the workings of the physical energies to which she owed the restitution of a little health and strength. Those cured in apostolic times were made "whole every whit;" the lame leaped, danced and ran.

The miracle accomplished at Maryborough, under the auspices of the Right Rev. Dr. Doyle and Mr. O'Connor, titular rector of the said parish, is at once more striking and more suspicious. On the 6th of March, 1823, that zealous prelate wrote to the "Most serene and very reverend prince," informing him that Maria Lalor, the daughter of a respectable and pious catholic, had lost the use of her tongue; adding, "her organs of sense continue perfect, and she strictly adheres to that piety of life which she has preserved from her most tender age." In reply he received from Hohenloe a communication addressed as follows:

"To Miss Lalor, and all those who will spiritually unite in prayer.

"On the 10th of June, at nine o'clock, I will, agreeably to your request, offer my prayers for your recovery. Unite with them at the same time, after having confessed and received the holy communion, your own, together with that evangelical fervour, that full and entire confidence, which we owe to our Redeemer Jesus Christ. Excite in the recesses of your heart the divine virtues of due contrition—of an unbounded confidence that you will be heard—and an immoveable resolution of leading an exemplary life for the purpose of preserving yourself in a state of grace. Accept the assurance of my consideration."

Mr. O'Connor, having received the proper instructions, resolved to proceed accordingly, and in due time made known the result to his ordinary.

"At twelve minutes before eight o'clock, on the morning of the 10th, my two coadjutors, with myself, began mass at the hour appointed. I offered the holy sacrifice in the name of the church. I besought the Lord to overlook my own unworthiness, and regard only Jesus Christ, the great High Priest and Victim, who offers himself in the mass to the Eternal Father, for the living and the dead. I implored the Mother of God, of all the angels and saints, and particularly of St. John Nepomuscene. I administered the sacrament to the young lady at the usual time, when instantly she heard as it were a voice distinctly saying to her—'MARY, YOU ARE WELL;' when she exclaimed, 'O LORD, AM I? and overwhelmed with devotion, fell prostrate on her face."

Dr. Doyle forthwith announced this cure to the world in the shape of a pastoral letter, accompanied with a statement of facts, as if drawn from medical certificates. It was asserted that the surgeon, Dr. Smith, as a similar case had never occurred in the course of his practice, had consulted eight of the most eminent physicians in Dublin; and the result was, that no hopes could be entertained of her recovery. It was further asserted, that this decision was imparted by Dr. Smith to the father of the young woman. But it soon appeared that these facts, so confidently proclaimed, were altogether unknown to the surgeon; and accordingly he soon afterwards published *a flat and unequivocal denial of the whole representation, in as far as it concerned himself, solemnly declaring it to be a fabrication entirely at variance with truth.* In short, this miracle, so warmly extolled in the pastoral address as a prodigy different in kind, but not in magnitude, from the raising of the dead, turned out, we are told, to be a most contemptible juggle—a juggle of which Dr. Doyle became so heartily ashamed, that so far from defending it against the deadly thrusts of the "Rational Christian," he left it to "engage the attention of physicians and those without occupation, while he himself mixed with the crowd—the simple and the poor."*

"The Darker Superstitions of Scotland" naturally reminded us of those which still prevail in the sister island, countenanced, as we find, not only by old women, but also by archbishops, bishops, and rural deans. We are far, however, from insinuating that the fraud at Ranelagh and Maryborough was so entire as not to have in it a mixture of innocent dupery. We have seen a

* See the "Voice of Facts from the convent of St. Joseph, Ranelagh," published by Blackwood, Edinburgh, 1824.

private communication from the prioress of St. Joseph, which bears many unambiguous marks of sincerity and cordial belief; and although the miracle performed on Miss Stuart was extremely incomplete, leaving her with weak limbs, her pulse at 120, and an issue in her arm in full discharge without any appearance of healing, there is no doubt that the head of the convent perceived in the partial improvement which had taken place, a direct interposition of the hand of Providence.

But, returning to the work more immediately before us, we may remark that a large class of superstitions fall under the head of spectral illusions—those morbid impressions which arise from a disordered state of the blood or secretory vessels. Such phenomena were no less familiar to the ancients than they are to modern physicians, though the cause had not been so clearly ascertained. Hippocrates speaks of those who thought themselves infested by demons; and he assigns reasons why—this being more incident to females—many of them in his time devoted offerings, even their richest apparel, to Diana for relief. Plato too observes that it was common, for women especially, and those who were imbecile, to be terrified by spectres; and when awake, recollecting the visions of their dreams, to vow statues and sacrifices, and to fill the streets and houses with altars and temples, in order to be free from such frightful visitations. But the spectres which occasion the greatest alarm, and which so long puzzled the ingenuity of physiologists, are those which present themselves to the waking eye, and at times when there is no consciousness of disease. For example, there was a quarrel between Janet Cook and John Richardson, "and immediatelie the said John did take sicknes so that he died, and all the two last days before he died he said that Janet Cook was there in his sight, howbeit the folkis in the house could not see her." Again; "James Douglas's horse fell under him. On recovering himself, though not much the worse, he seeth lively, to his appearance, Janet Coke sitting by him. He recommended himself to God, and went on his journey: that night he took a high and sudden fit of sickness, which continued till his death; and about eleven hours at night the great fit always came upon him; and the same James being very tractable, said, before his death, that the said Janet was often standing at the bed-foot—'the Lord forgive my friends if they do not cause to burn Jennet Coke, for she is the cause of my death.'"

In the same way Susanna Baylie, a penitent and confessing witch, confronting another, exclaimed, "thou fiery Lucifer, confess thy fault, for thou art worthy of death; because, upon a night about sixteen years since, you, having a pique at me, came into my house at midnight, the doors and the windows being shut, while I was asleep in bed with my husband and child; and you put your hands on my throat, and thought to have worried me." A learned, wealthy, and respectable citizen of Cologne, acquainted Nider that, during a dangerous malady, he "conceived, in viewing himself on all sides, that he was two men." In Okye, a woman repeatedly beheld another resembling herself, walking solitary, at no great distance, and in changes of apparel like her own. This she believed, as it proved in fact to be, a presage of her dissolution. A young woman of Lewis constantly beheld the back of her own image upon going into the open air. Aubrey speaks of a daughter of the Earl of Holland meeting her apparition in Kensington Garden; and of another who saw herself for a quarter of an hour at a time; but she was not the only spectator of the phantom. Fordun, one of the Scotish historians, relates that Ralph, Abbot of Kinloss, accompanied several other dignitaries to a chapter of the Cistertian order, held in 1214. At the appointed place of convocation, the cook, unable to serve up the usual meal of fish, with greater zeal than prudence substituted a quantity of flesh, from which, collecting the boiling fat as it rose, he resolved to call it butter, and without further ceremony mixed it with the abbot's porridge. All, after having eaten heartily and unsuspiciously, retired to rest. "But (adds the chronicler) the Abbot of Kenloss, ruminating on I know not what psalms and prayers, beheld the blackest Ethiopian, with a horrible visage, enter by a shut window, and survey, with evident satisfaction, the bed of every guest, though chiefly interested in the cook, whom he seemed desirous of embracing." The abbot, however, on his approach, fortified himself with the sign of the cross, and awaited the issue in silence. Viewing him sternly, but daring to come no nearer, the visiter vanished like smoke through the shut window.

All our readers will recollect the visit paid to Lady Beresford, a few years ago, by the ghost of Lord Tyrone. Her ladyship is said to have been a woman of very bad principles, and accordingly, to clear up her doubts with regard to a future existence, she had entered into a compact with the said baron, binding the one who should die first to appear as soon as possible to the other. Lady Beresford, it is added, expressed great doubts as to the reality of the apparition, even after the punctual lord had actually fulfilled his promise; in consequence of which scepticism he found it necessary, next visit, to mark her wrist, and to turn up the curtains of the bed in a most supernatural manner, that he might give her the most satisfactory proofs of his having really returned to the upper regions. She related the story next day to her husband, and shortly after a letter arrived announcing the death of Lord Tyrone. This anecdote requires no observations, and the mind of the public at the time soon satisfied itself as to the real state of the fact. Lord Tyrone was known to be dying, and Lady Beresford, half asleep, half awake, and probably a little uneasy in her imagination about the promised visit, would very naturally dream of spectres; and the mark on her wrist, if not occasioned by an over-tight bracelet, might have been produced by her coming in contact with some part of the bed during the agitation consequent upon the supposed interview with her departed friend.

A useful book might be written on the connection between certain morbid conditions of the body and the apparition of those numerous phantoms which are known to harass plethoric persons. Dr. Ferriar, who has treated this subject with

great research and ingenuity, has by no means exhausted it; and a still larger collection of cases, well authenticated and properly explained, could not fail to be of the utmost service both to the medical student and to the valetudinarian. It is related of a celebrated literary character, that as he was sitting in his study, a room with which the passage which led to the kitchen communicated, he was interrupted in his studies by a little old woman, who had on her arm a basket of provisions. He requested the good old dame to step into the kitchen, to which, he supposed, she had mistaken her way; and in order that he might not be further disturbed by her, he opened the door and showed her which direction she was to take. After he had returned to his desk he fancied himself again assailed by the little old woman. He expostulated with her, and once more pointed out the way to the kitchen; but after he had a second time returned to his labours, he again found the old woman at his elbow. He instantly conceived his real situation, rung his bell, and sent for a surgeon; and it was not until he had been copiously bled that he was set free from the visits of the stranger. The surgeon informed him that his blood was in such a state, that, had he not been bled, he would have undoubtedly sustained an attack of apoplexy, which in all probability would have carried him off.

The case of M. Nicolai, a bookseller in Berlin, is still more striking; for he was annoyed by phantoms during several months in succession, all which time he was in a state of perfect sanity, and quite aware that this strange phenomenon originated in the distempered condition of his nervous system. But by persevering in the use of medicine and phlebotomy, he compelled the spectres to take a final leave of him; and we have no doubt that in many similar cases the mental eye will be most successfully purged by cooling draughts, copious bleeding, and gentle cathartics. Leaving, however, these grotesque creations of the "mind diseased," we proceed to mention a few particulars connected with a physical apparition, which, in the year 1812, occasioned no small perturbation in the northern counties of England, as being in some degree coincident with the greatest preparations ever made by Buonaparte for a military enterprise. On Sunday evening, the 26th of June, and between seven and eight o'clock, Anthony Jackson, farmer, aged forty-five, and Martin Turner, the son of William Turner, farmer, aged fifteen years, while engaged in inspecting their cattle, grazing in Havaral Park, near Pepley, part of the estate of Sir John Ingleby, Bart., were suddenly surprised by a most extraordinary appearance in the Park. Turner, whose attention was first drawn to this spectacle, said, "Look, Anthony, what a quantity of beasts!" "Beasts!" cried Anthony, "Lord bless us! they are not beasts, they are men!" By this time the body was in motion, and the spectators discovered that it was an army of soldiers, dressed in a white military uniform, and that in the centre stood a personage of a commanding aspect, clothed in scarlet. After performing a number of evolutions, the body began to march in perfect order to the summit of a hill, passing the spectators at a distance of about a hundred yards. No sooner had the first body, which seemed to consist of several hundreds, and extended four deep over an enclosure of thirty acres, attained the hill, than another assemblage of men, far more numerous than the former, dressed in dark coloured clothes, arose and marched, without any apparent hostility, after the military spectres: at the top of the hill both of the parties formed what the spectators called an L, and passing down the opposite side, disappeared. At this moment a volume of smoke, apparently like that vomited by a park of artillery, spread over the plain, and was so impervious as for nearly two minutes to hide the cattle from the view of Turner and Jackson, who hurried home with all possible expedition; and the effect upon their minds, says the narrator, even at this distance of time, is so strong that they cannot mention the circumstance without visible emotion. It ought to be remarked, in passing, that the accounts of this wonderful sight given by the two spectators, agreed precisely in the main points, differing only as to the length of time during which the military array continued in view, and as to a part of the armour glistening in the sun. The younger person thought the phenomenon did not last longer than five minutes; the elder imagined that it could not be less than a quarter of an hour. Jackson declares that during the whole time it occupied their attention, "they were making to each other such remarks as arose out of the spectacle."

As similar appearances are said to have been witnessed at various times in different parts of the country, and as armies of mist and fog are frequently seen by the solitary inhabitants of North America, Greenland, and the highlands of Scotland, it may be proper to observe, once for all, that they have been satisfactorily explained on the common principles of optics, combined with certain conditions as to the angle of the solar rays and atmospherical refraction. The Spectre of the Brocken, the Fata Morgana in the Straits of Reggio, and the thousand visual deceptions recorded by travellers in Africa, are all to be referred to the physical circumstances now mentioned. A phenomena analogous to that now described is to be found in Adair's Travels in North America. After contemplating the general grandeur and sublimity of the fall at Niagara, he and his companions were drawn to admire the variety of shapes which the superincumbent vapour assumed beneath the impulse of the wind. "Sometimes," says he, "it was driven with violence against the rocky mountain to the north, and being broken by its projecting rugosities, it ascended, but with great rapidity, like an army climbing to the storm of some citadel on the summit. We thought, as it shone in the setting sun, that we could perceive the glittering of armour, and in the prismatic colours we fancied to ourselves the military uniform of our countrymen." It has, accordingly, been imagined that the army seen by Jackson and Turner consisted of an exhalation, or rather, a sudden escape of vapour from the ground, carried gently along near the surface by a current of wind, and reflecting from its various portions, more or less condensed, the several colours of the rainbow; which would at

once exhibit the general white uniform of the military phantoms, the glittering of arms, and the specks of scarlet, which were converted by the excited fancy of the farmers into a commander on horseback. But we are rather disposed to explain such appearances on the principle suggested by Kircher, namely, that they are the reflections of real objects, the image of which is first received in an opaque cloud, and thence conveyed to the earth through the medium of a moist atmosphere. It is probable, therefore, that on the day in question a body of troops, consisting of foot and artillery, was exercised or reviewed in some part of England; and that a succession of aqueous strata was so arranged, at a certain elevation from the earth, as to receive and communicate the reflected picture. The faculty of determining the number and distance of a fleet at sea, by watching particular indications in the sky, can be acquired in the tropical regions of the Pacific and Indian oceans. In short, the figure of the ships is perceived in the atmosphere; and their distance from the place of observation is estimated by the altitude of the reflection. To the same principle may be referred the phenomenon, so well known to sea-faring men as the "ship's ghost;" and which consists in the reflection of the vessel from a dark cloud opposed to one full of light.

Such spectral illusions were the cause of much terror and suffering in the dark ages of Scotland. Evidence was received from a woman that while in bed with her child, Janet Cock and "many otheris came in and lay above her, and that they all drew at her chyld; and she having said, the *Spirit of Grace be in this house*, they went all out of the glasse with a noise." Further, when a mother in Dundee lay "in chyld birth with her young chyld besyd her, in the nyght-tyme, the door being locked, Janet Miller with other notorious witches, who are since burnt, blew up the doore and came in upon her, essayed to take the young child from her, but not having the power, went to the door in a confusione." Agnes Finnie was exposed to a serious charge, that there having been a quarrel between her daughter and John Cockburn, "quhairin grit flyting and outrageous wordis, na doubt, was utterit by ayther of them to utheris so that they partit unfriendis:—the said John Cockburn going that nycht to his bed to take the nycht's rest, little rest gat he. But having gottin his first sleip, and awaiking furth thereof, being struckin in greet fier and amaisement, he saw and evidently perseaved—all the durris and windowis of his house being fast closed—you Agnes Finnie, with your dochter, bothe sitting on his bed syd fearcelie rugging at his briest, and being in excessive fear with that their violent rugging and vexing of him in manner foresaid, he cryed out all that tyme, *God be in this house!* I ken ye well eneughe! *God be in this house!* Further it was alledged of Margaret Hutcheson that, upon the first day of Januuary last, about twelve o'clock at night, ye came unto John Clerk his house, and sat down there at the fyre syd, and kombid your hair, to the great affrightment of his wyff, the dores and windows being all locked and closed: and that you did by the space of seevne or eight nights."

Mr. Dalyell, at the close of his work, alludes to a superstition of modern origin—the use of tongues. The inhabitants of these kingdoms have witnessed the revival of all the extravagance of antiquity, little creditable to an era of sense and civilisation. Wild enthusiasts start up amidst assemblages collected for divine worship, incoherently screaming an uncouth jargon, with frantic gesticulation, under the blasphemous pretext and preposterous belief of a holy inspiration, that they "speak with other tongues." "Let no one wonder," says he, "if confirmed lunacy—the demoniac possession of old—shall follow its developement of modern *demonstration of the tongues*, under an arrogant pretension to divine inspiration."

To the reader who wishes to enlarge his stock of knowledge on this antiquated subject—the superstitions of our ancestors—we beg leave to recommend a perusal of Aubrey's *Miscellanies*, Scot's *Discoverie of Witchcraft*, Kirk's *Secret Commonwealth*, King James's *Demonologie*, Scribonius *de Sagarum Natura*, Glanvil's *Saddducismus Triumphatus*, Tiers' *Traité des Superstitions*, Boissardus *de Divinatione et Magicis præstigiis*, Perkins' *Discourse of Witchcraft*, Schottus *Magia Universalis*, Grillandus *de Sorteligiis*, Catta's *Infallible, True, and Assured Witch*, and Springer's *Malleus Maleficarum*.

From the Juvenile Forget Me Not.

THE NAUTILUS.

BY MARY HOWITT.

Like an ocean breeze afloat
In a little pearly boat—
Pearl within, and round about,
And a silken streamer out,
Over the sea, over the sea,
Merrily, merrily, saileth he!

Not for battle, not for pelf,
But to pleasure his own self,
Sails he on for many a league,
Nor knoweth hunger nor fatigue:
Past many a rock, past many a shore,
Nor shifts a sail, nor lifts an oar:
Oh! the joy of sailing thus—
Like a brave old Nautilus!

Thou didst laugh at sun and breeze
On the new created seas:
Thou wast with the dragon broods
In the old sea-solitudes,
Sailing in the new-made light
With the curled-up Ammonite!
Thou survived the awful shock
That turned the ocean bed to rock,
And changed its myriad living swarms
To the marble's veined forms—

Thou wast there!—thy little boat,
Airy voyager, kept afloat
O'er the waters wild and dismal,
O'er the yawning gulfs abysmal;
Amid wreck and overturning—
Rock-imbedding—heaving, burning!
'Mid the tumult and the stir,
Thou, most ancient mariner,
In that pearly boat of thine,
Sat'st upon the troubled brine!

From the Monthly Magazine.

YANKEE NOTIONS.

Yankee-land, or the New England portion of the United States, does not make a great figure in the map of the American Republic; yet the traveller who leaves it out of his route can tell you but little of what the Americans are. The history of the Yankees is the history of the republic; the character of the Yankees has influenced, and continues to influence, that of every part of the nation; and their name, from a provincial designation, has become among foreigners the popular appellation of the whole people. Such is the predominance of character and civilisation; the other states are becoming like the Yankees, while the Yankees are keeping like themselves. It is in New England, therefore, that you find the most original, operative, and distinctly-marked American character. Here should the traveller begin and end; whoever leaves the Yankees out of his "United States as they are," will find he has left Hamlet out of Hamlet's tragedy; and the person who, upon a short intimacy with the pork-merchants of Cincinnati and the kitchen-wenches of New York, pretends to write a book on the "Domestic Manners of the Americans," will show the same degree of modesty with him who touches at Liverpool and the Hebrides, and then spawns his quarto, entitled "John Bull at Home."

It is in New England that you find Jonathan at home. In the other states there is a mixture, greater or less, of foreign population; but in New England the population is homogeneous and native—the emigrant does not settle there—the country is too full of people, while the more fertile soil of the west holds out superior attractions to the stranger. It is no lubber land; there is no getting half-a-dollar a day for sleeping in Massachusetts or Vermont; the rocky soil and rough climate of this region require thrift and industry in the occupant. In the west he may scratch the ground, throw in the seed, and leave the rest to nature; but here his toil must never be remitted; and, as valour comes of sherris, so doth prosperity come of industry. The southern planter, who visits the east and finds the whole land a garden, wonders why the fat fields and the warm sky of his own region do not produce the same picture; and, in his endeavours at an explanation, ascribes it to the tariff, whereas the difference in the two regions arises from the regular and natural operation of things—it is solely the effect of industry.

What is Cape Cod but a heap of sand? yet it maintains thirty thousand people, and there is not a beggar among them. All the tariffs that could be devised never would ruin New England, were they framed *ex proprio motu* of Georgia or South Carolina. While the Yankees are themselves, they will hold their own, let politics twist about as they will. They are like cats; throw them up as you please, they will come down upon their feet. Shut their industry out from one career, and it will force itself into another. Dry up twenty sources of their prosperity, and they will open twenty more. They have a perseverance that will never languish while any thing remains to be tried; they have a resolution that will try any thing, if need be, and when a Yankee says "I'll try," the thing is done.

Boston is but the fourth city in the Union as to population, yet in many points it may be considered the chief: a metropolis there never will be in the United States—I mean for practical purposes—as London is to Great Britain, or Paris to France,—for Washington will never be a great city. There may be an overgrown population at New York, and there may be a Federal Government for ever within the ten miles square, but neither of these, nor any other spot, will ever be able to assume to itself the whole powers of a metropolis. No city will exercise a moral dictation over the rest, or over the country: no city will give the tone in politics, or set the fashions in literature, for the whole Union.

New York and Philadelphia owe their great population to the numbers whom they receive from the other portions of the Union, and the other side of the Atlantic. Boston has grown by internal augmentation only, or accretion from its immediate neighbourhood; in consequence, it exhibits nothing of that shifting and heterogeneous character which marks the great cities of the south. In those cities you find masses of people who know little of each other, diverse in origin, dissimilar in habits, discordant in tastes, difficult to calculate upon or to combine for any common end: but the Bostonians are as one man—they know each other, understand each other; whatever affects one portion of their community affects the whole; they have a perfect unity of feeling and stability of character. This has ever been their peculiarity, and to this it is owing that the revolution first exploded in their city. Had Boston been as New York, Fanueil Hall would never have been the cradle of American liberty. Whatever the Bostonians do, they do commonly with great unanimity and effect. To do a thing "in Boston style," is proverbial throughout the country, as signifying a thing done with superior promptness and execution. With sixty odd thousand inhabitants, Boston will raise more money in a given time, for any public purpose, than either New York or Philadelphia, with more than two hundred thousand each.* It is the chief city, too, for literature and the fine arts; for your Yankee, with all his thriftiness, is a huge buyer of books, and will bid higher for pictures than any body else on the western side of the Atlantic. As New England is to America what Tuscany is to Italy, so may we continue the parallel, and compare Boston to Florence, which cities resemble each other in more points than one. Boston, like Florence, is distinguished for letters and the polite arts, for polish and civility of manners, for the talent of its citizens, for their early love of liberty, and for the external appearance of the city, the beauty of its situation, the splendour of its edifices, the cleanliness of the streets, and the general appearance of industry, wealth, and comfort; while, for the orderly character of the population, their sobriety of habits, and the correct tone of moral feeling that prevails among all

* With regard to this matter, and the buying of books, there may be a difference of opinion.—*Ed. Museum.*

classes, it may challenge a comparison with any city, large or small, upon the earth. Some well-intentioned but ignorant people, in their zeal to encourage the consumption of cold water, have been in the habit of telling one another that much intemperance has prevailed there; this is a totally wrong impression. I have seen more persons intoxicated at Rome in ten days, than I have seen in Boston for ten years.

It is remarkable that the descendants of the rigid, and, as we are apt to call them, bigoted puritans, should have become the most tolerant in religion of all the American people. There is a liberty of conscience, it is true, throughout the Union, but religious prejudice is mighty in many parts. In Boston, the severe and strait-laced Calvinism of former times has disappeared. The unitarians now form the largest sect in the city, and, as is well known, number in their ranks some of the ablest men in the western world. With this sect there is no intolerance; the opposing sects have learnt forbearance from their example, and the *odium theologicum* has lost its bitterness here. The Yankee is cool, cautious, and calculating; he wants a reason for every thing; an old prejudice is no obstacle in his way to improvement; his opinions must rest upon solid, tangible ground. His religion must be a religion of the understanding. He is not credulous, he is not enthusiastic. There are no catholics in New England, save a few foreigners, and there never will be any. The New Englander is eminently a religious man, but his religion never will be a religion of ceremonies. The episcopalians are much less numerous here than in other parts. Methodists are rare, and the other enthusiastic sects still more so.

Boston, however, is by no means the whole of Yankee-land. Paris, we know, is all France, and London may carry all England whithersoever she listeth. Not so in America. Brother Jonathan, with all his guesses, is another guess sort of a person; the Yankees of the country cannot be led by those of the capital, except perhaps in the fashion of a go-to-meeting coat, or the hue of a riband. There is a watchful jealousy among them which is for ever on the look out, lest the capital should get an undue ascendancy; no matter what the point in question may be, it would create an alarm among the lowest yeomen of Berkshire and Worcester counties, were it to be noised abroad that Boston had one feather's weight more influence than was allowed her by chapter and section of the constitution. Urban influence can thus get no ascendancy; the city has not, like a great heart, all the life-blood of the community at command; the country is all heart. All the great cities were occupied by the enemy during the revolutionary war, yet was not the land conquered, —I should rather say the *people* were not conquered. "Men," says Sir William Jones, "and not cities, constitute a state."

There does not exist that difference between town and country manners in New England which you find in most other countries. Education, books, newspapers, and the facilities of communication between all parts, bring the different classes upon a level. The rustic dresses the same as the cit—when he undertakes to be dressed; discusses the same topics of news, and shows the same degree of information on common matters; and as to his speech and behaviour, he must be a rare animal among his neighbours who displays boorish manners, or talks bad English. "The land of steady habits" has sometimes been used as a nickname for the country; but nothing is more applicable. Habits are so stable, and the whole moral frame of society is so well organised among these people, that, were all restraints of law removed, things would go on as usual: they are a law to themselves.

In European countries, he that is born a peasant will be a peasant all his life; his chance of forming an exception to the rule is exceedingly small. But, on beholding the most rustical clown of all Yankee-land, it would not be safe to affirm that he would not be numbered, at some future day, among the most eminent men of the country. There is no burying a man of genius here; the humblest birth shuts out no one either from the hopes or the facilities of rising to that station for which his native talent has qualified him. Rare, indeed, is it to find an individual who cannot read and write; every one has therefore that modicum of knowledge placed within his reach which will enable him to obtain more, should his wishes aspire. Clowns, properly speaking, there are none among the Yankees: a Yankee is emphatically a civil man, though his civility may not produce all the bows and grimaces and unmeaning compliments which accompany or constitute that quality among the French; rudeness of manners could be charged against these people only by those who know nothing about them. "Countries," says Goldsmith, "wear very different appearances to persons in different circumstances. A traveller who is whirled through Europe in a post-chaise, and a pilgrim who walks the grand tour on foot, will form very different conclusions." Now, sundry people have been whirled from Boston to New York in a mail-coach, and said I know not what about manners. I have travelled over the New England States on foot—over highways and by-ways; supped at the most splendid hotels and the most paltry inns; entered every farmer's door that offered as a resting-place; and crossed any man's garden, or corn-field, or orchard, that lay in my way, without receiving an uncivil word on my whole route. On one occasion I lost myself in the woods among the Green Mountains of Vermont, where I imagined there was no living creature to be encountered for miles, except black bears, catamounts, and similar country gentlemen; but on a sudden I emerged from the wood into an open spot where stood a log hut. A little flaxen-haired urchin espied me coming, and began to scramble with all speed—to hide himself, as I supposed: but no—it was to gain the summit of an immense log of wood, which lay by the little pathway, where he greeted me, as I passed, with as profound a bow as I ever received.

A Yankee is cautious,—more so than a Scotsman. He will make no bulls, but take especial care not to be caught tripping in his speech. It is amusing often to see the dexterity with which he will avoid giving a direct answer to a ques-

tion, where he suspects it may not be altogether safe to speak positively; and as to answering an abrupt query, without knowing why it is put, catch him there if you can. Guessing, after all, is not so unprofitable a practice: it is no small undertaking, at times, to extract evidence from a witness in court.

"Did you ever see the man drunk?" asked a counsel of a fellow on the stand.

"Why, I've seen him jolly."

"But did you ever see him drunk?"

"I 've seen him pretty well to live."

"But did you ever see him drunk?"

"I 've seen him when I thought he had full enough."

"But was he drunk, or was he not?"

"Why, he might have been drunk; and then, again, he might not. I can't say he wasn't, and I can't say he was."

"Pray," asked another, "did you see the defendant throw the stone?"

"Why, I saw him have a stone, and I suppose he might have thrown it."

"How large a stone was it?"

"Why, I should call it a largish stone."

"But say how big it was."

"It appeared to me to be a stone of some bigness."

"But describe the bigness of it."

"As near as I can recollect, it was a considerable of a stone."

"But can't you compare it, and say it was as big as this thing or that thing?"

"Why, if I should say now, I should say it was as big—as big—as a piece of chalk."

The highest praise which a Frenchman imagines he can bestow upon an individual, is to call him *un homme d'esprit*. An Englishman describes his best friend as a "good-natured, sensible fellow;" a special Yankee's commendation from his neighbours is, that he is a "smart enterprising man." Nothing for a Yankee like enterprise; and good qualities to him are worth little without it. I think it is in Cicero's newly discovered "Republic," *nec vero satis est habere virtutem nisi utare*. This is a true Yankee maxim, —give your good qualities action. To him it is inconceivable that a man should be good for any thing who does not make his presence felt among those around him. A stirring spirit, stirring deeds, a stirring life,—these form the common theme of praise; and if a man is said to be good, it will be necessary to answer the question, "Good for what?" "Qu'est ce qu'il a fait?—What has he done?" was Napoleon's query when any man was said to possess talent; and your Yankee is pretty much of the same way of thinking, being accustomed to require constant evidence of a man's usefulness, ere he allows him the praise of doing his duty among men. And well that it is so: he has seen the soil which gives him subsistence conquered, by his own unremitted exertions, from the wilderness; he has seen those political institutions which are his happiness and his boast built up by his own hands; and he is sensible that prudent and industrious habits can alone preserve to him and his posterity the blessings they have gained.

When America shall produce a writer of truly original genius, it is five to one that man will be a Yankee. Franklin was a man whose genius, more than that of any other of his countrymen, marked the age in which he lived; and there is not a trait of his character but is true to New England. The most eminent public man of the present day is Webster; and, in spite of party animosities and sectional prejudice, there is not one whose influence is so powerful, or whose superiority is so universally admitted. The mind of this eminent man is of the true New England stamp: his eloquence is not showy, dazzling, nor elaborate; he does not seek to surprise you by ingenious paradoxes, nor fill your ears with a furious sound of mighty words. You never think of exclaiming between his periods, "How fine!" but you find him persuasive, convincing, and effectual in argument, such as no other man to whom you ever listened. Sincerity, and earnest, full conviction of the truth, distinguish the manners of this orator; and plain sound sense is the characteristic of his matter;—without plain sound sense, indeed, can there be any true eloquence? He does not waste his strength in attempts to utter merely striking things; he is not a brilliant speaker, as the epithet is commonly understood. Your brilliant orators are amusing, but they are not powerful; they are seldom effective to any good purpose. John Randolph was as brilliant a crackskull as ever sparkled; he shone among the American orators a star of the first magnitude, though by no means a fixed star. No speaker in congress could draw an audience like him: his sayings were in every man's mouth, his reputation filled every corner of the Union. But Randolph was brilliant, and nothing more; he lacked sound sense, and thus lacked the most efficient weapon of his warfare. People listened to him, but never heeded him; for though he had talent, he had no wisdom. With all his fame, he was without influence; for while the multitude crowded to hear his brilliant speeches, no man valued his opinion a corn-stalk. He was no statesman; though whatever party could count him among its numbers for the moment, commonly thrust him into the van as a forlorn hope; yet, to every interest he espoused, he did as much mischief as good. Never was a more useless man of genius. After a long and restless life, devoted solely to political affairs, what has he done? Nothing. He is gathered to his fathers; and nought is left to perpetuate his memory but the reputation of a brilliant talker. Words, not deeds, have signalised his career. No great public act is marked with the name of him whose voice was loudest and longest in the councils of the nation during the most critical period of its existence. Such is a brilliant man!

"Si tu brillais sans être utile,
A ton dernier jour on dirait,—
Ce n'est qu'une étoile qui file,
Qui file, file, et disparaît."

Randolph could never have been a New Englandman; the production of such a being in this country would have been an anomaly in the operations of nature; and had the thing occurred, he

would not have found himself in a congenial element; he could not have gained eminence here; the Yankees would have put his brilliant qualities to a trial too rigid and severe before they greeted him with the title of "New England's favourite son." The eccentric sallies of the man of Roanoke would not have passed for wisdom at Boston; and most assuredly no forty thousand inhabitants of Massachussets would have returned him to congress year after year, without more evidence of his usefulness than he was accustomed to bear home at the end of the session. A Yankee would choose his representative as he chooses his minister or his every-day coat—taking care that he wears well and does good service.

"Holloa! you man taking a nap!" cried a fellow from the gallery to a representative whom he spied treating himself to a doze during a narcotic discourse; "wake up there! the state don't pay you three dollars a day for sleeping." Neither is the Yankee disposed to pay his representatives for talking. The congress gentlemen, it is notorious, are terrible long talkers, but among these the New England members are the least offenders.

In spite of this predominant inclination toward the useful, the Yankee is no despiser of those arts which adorn and embellish life. The liberal sciences have nowhere in the country received such encouragement as in New England. The cities, the towns, the villages, the country seats, the private dwellings display more elegance and taste than those of any other part of the Union. If the New Englander is prudent, he is also charitable: he has not, like the European, the daily spectacle of poverty and suffering before his eyes, to render him callous to human misery; nothing is more prompt and effectual than the succour which is here afforded to the needy or unfortunate. Some travellers have pronounced the Americans a sordid people, wholly occupied with the thoughts of gain, because no two men can be heard talking in the streets without using the word "dollar"—as if people in the streets were accustomed to talk of any thing except what brought them there. The Americans mind their business while they are about it, and do not mix that with their studies or amusements. Is "pound" or "shilling" the most uncommon sound that strikes your ear in the great thoroughfares of London? Is the mention of a "sou" never heard upon the quays and boulevards of Paris? Go where you will, the common business of life will occupy most men's thoughts and language. In the eternal city itself, your ear is struck with the perpetual iteration of the word "baioc," and the Romans, I fancy, never were charged with a predominant passion for heaping up pauls and scudi. But some people, when they get abroad, appear never to have had their eyes or ears open before; they espy marvels which have been common sights to them in their own land ever since they were born. Doctor Johnson had these persons in his mind when he spoke of an individual, not remarkable for his shrewdness, who proposed to travel into Asia for the purpose of ascertaining what curious inventions might exist there unknown to Europe—"He will bring home a wheelbarrow, and think he has made a wonderful discovery."

Some one has remarked that the distinguishing characteristic of the American is his "want of loyalty." This of course was uttered as a reproach, and as the word is not American, it was a pretty safe device to make use of it. What is the loyalty of an American? Is it a respect for the chief magistrate?—He is sure to get all he deserves. Is it an attachment to the institutions of the country?—Nobody ever denied the American this. Is it a love for his native soil?—Nor can he be proved deficient in this affection, till you find him, like the European, leaving his country for ever. If it be meant that the American does not possess that feeling which would "stand by the crown, though it hung upon a bush," the charge may be true enough; for unless the crown hangs upon a head-piece, Jonathan will *guess* very shrewdly that it is not worth standing by. To drop the metaphor, he will not fight in support of an old institution that has become useless. This, in fact, is the very head and front of his offending in the eye of many of his "unfriends," and they were accustomed to lay to his charge some years ago that he had a sad and disloyal trick of throwing aside whatever he found did not suit him. We hear less about this at the present day, now that some other people have begun to follow his example.

The Yankees are distinguished, above all other men, for a certain capacity which, in the language of the country, is termed *contrivance;* this is that sort of ingenuity, invention, or skill, which enables an individual to turn his hand to any occupation, or to devise a scheme for any sudden emergency. Thus, if a Yankee is crossing the Alleganies on horseback, and is overtaken by a snow-storm, he will jump into the woods with his hatchet, and in three hours' time will be riding over the snow upon a sledge of his own construction. The records of the patent office at Washington exhibit a striking testimony of the superiority of these people in ingenuity; by far the greater number of inventions are from New England. A Yankee farmer is a sort of Jack at all trades; he not only delves the soil and goes to market, but he is carpenter, shoemaker, weaver, cooper, soap-boiler, and more trades than these. He turns wooden bowls, makes buckets, sets up shooks, weaves baskets, manufactures brooms, and invents washing-machines. In this last mentioned matter the New England ingenuity is inexhaustible, and one would imagine that the "second virtue" of cleanliness had been elevated to the first rank in this land, such a wilderness of patent gimcracks have sprung up in the attempt to usurp the honours of old Dumb Betty. It is a Yankee's main study to be "improving" every thing; his very language breathes this spirit, for he who occupies a tenement is said to "improve" it. To leave a thing no better than he found it, seems to him no fair usage of the globe we inhabit.

In traveling over the kingdom of Naples, and contemplating the wonders of that favoured land, its fertile soil, its genial climate, its admirable capacities for commerce, and the contrast exhibited to all these advantages by the sloth and ignorance of its population, its beggars, and brigands,—I

have been struck with the whimsical imagination of the scene that might ensue, were a plain Yankee taken from his plough-tail and placed on the throne of the Two Sicilies. His majesty would begin a regular overhaul of the whole body politic the morning after his coronation. "What's this I see?" says the king. "Where are your overseers of the highways—your school commitees—your select-men? What idle fellows are these in the streets? What are these bells ringing every day? What means this crowd of ships lying behind the mole with nothing to do? or this *marina*, the water's edge of my great city, where I see no piles of merchandise, no trucks nor dray-carts driving about with goods, nor half the business doing in a month that is done on Boston Long Wharf in two hours? Come, bustle, occupy; set the lazzaroni to work upon the roads; send the children to school; make a rail-road here and a turnpike there; bridge this river and canal that; hang the Calabrian robbers; give the monks a rouse; go into the churches, and strip me those trumpery shrines; sell the gold and silver and jewels with which they are heaped, and the interest of the money will support all the poor of the kingdom, for I'll have no beggars nor idlers while my title is Jonathan the First. People shall mind their business, for I will abolish these *festas*, which come every other day, and are good for nothing but to promote idleness. Henceforth there shall be no festas, but fast, thanksgiving, and independence. Set me up a newspaper in every town; take me a census of the population; fine every district that don't send a representative to the general court. I'll have every thing thrashed and set a bucking, even to the vernacular speech, for *dolce far niente* shall be routed from the Italian."

Now Jonathan the First might not understand quite so much of the antiquities of Pompeii, or the beauties of the Callipygian Venus, as Ferdinand the Second; yet, if the Neapolitan would not make a profitable *swap* by the exchange, mine is no true "Yankee notion." Q. Q.

From the Court Journal.

COURTLY DIALOGUE.

A jester, named Decour, who had been placed about the person of Henri IV. by D'Aubigné, grandfather to Madame de Maintenon, was so afflicted by his patron's unjust dismissal from his post of *Gentilhomme de la Chambre*, that he persisted in quitting the king's service. Some time afterwards, Henry encountered this man on the road to Nerac, and inquired whence he was coming. —"*Yes!*" replied Decour.—"Where are you going then?" cried the king.—"*Yes!*" reiterated Decour.—"Into whose service have you entered?" still persisted Henry.—"*Yes!*" answered the jester.—"Have you made a vow, then, to say nothing but yes?"—"*Yes!*" echoed the faithful friend of D'Aubigné, with a sigh.—"But will you not answer me if I command you to explain the motive of your whim?"—"*Yes!*"—"Speak out then, knave!" cried the king, "or it will be the worse for you. Why have you been saying 'yes' to me this half hour past?"—"Because, Sire, the Sieur d'Aubigné and I have found, to our cost, that you discard from your service those faithful adherents who make any other answer to your demands."—Henry was startled by the fidelity of the buffoon; and soon afterwards recalled D'Aubigné to court.

LOVE'S LEGACY.

BY THE ETTRICK SHEPHERD.

Canto First.

Fairest and dearest to my heart,
My being's aim and counterpart;
Sun of my soul, whose gladdening ray
Alone hath gilded sorrow's lay;
My hope, all other hopes above:
In one endearing word, MY LOVE!
How shall I tell thee what must be,
Or how address these lines to thee?
But all must out, though grief should drain
The moisture from my burning brain,
And wring the life-drops from the heart,—
The time draws nigh that we must part!
For man hath said that it shall be;
And Heaven hath winked at the decree.
And thus two hearts, whose union grew
When life was young and love was new,
Are doomed by hard decree to sever,
And—rueful thought!—perhaps for ever!
Yes, we must part—and He alone,
Whose zephyrs cool the burning zone,
Whose mighty arm can smite or save,
Can hush the wind and quell the wave,
Prevent the pagan pickaroon
Or deadly whirl of the simoon,
Whose fatherly and watchful eye
Pervades alike the earth and sky,
The present, past, and time to be,
Through mazes of eternity,—
Alone can tell, through peril and pain,
If we two e'er shall meet again.
Not meet again! What tongue can tell
The pangs of hearts that love so well,
At such a chill, unwelcome breath,
Like vapour from the shades of death!
I see it heave thy virgin breast
With throes that may not be suppress;
I see the eye that wont to shine
With softened beam when raised to mine,
Filled with the briny tears of pain,
Which on these lines descend like rain;
I see the roses fly thy cheek
And quivering lip that cannot speak;
And all those painful tokens true,
Which well my spirit's eye can view,
Will thee endear some other day
In isles and kingdoms far away.
Then list this little song of grief,
My only refuge for relief
From feelings which my soul benumb,
And fears that scarce a man become.
'Tis the sole gift that I can give
To her for whom I wish to live,
That I can send or she approve,
This simple LEGACY OF LOVE.
O list the fond and fervent lay!
For I have much that I would say
Of scenes we both remember well,
And former tales of love to tell,
To soothe thy mind misfortunes under,
When seas and continents us sunder:
I yearn upon the theme to be,
But must not sing as sung to thee.
First, then, I'll tell thee of a maid
That once my youthful heart betrayed—
A gleesome elfin, coy and wild;
Neither a woman nor a child,
But dancing on the verge between,
With air and motion cherubin;

Too gay to mark the mystic bound,
Almost too light to tread the ground;
Weak childhood's toys and trifles o'er,
And maidhood's glories all before:
How could such being, pure, refined,
But tread upon the yielding wind?
An eaglet o'er her skura riven—
A cygnet on the skirts of heaven—
A streamer in the ether blue—
A rainbow on the morning dew—
A thing to place on fairy throne,
And lover's mind to dwell upon.
How love ensnared me in its net,
Amazed me then, astounds me yet.
Ensnared by thing of lightsome smile,
Devoid of artifice or wile,
Appears to me so strange even now,
That by the star of love I vow,
Without all fiction or grimace,
There was some witchcraft in the case.
Yes, witchcraft! Wicked warlockrye,
Or what you choose to name it by,
Certes there was: for, ere I wist,
My wit was fled and broke my rest—
Nor joy nor happiness had I,
Save in that elfin's company;
I knew not what I wanted there,
Of play, of frolic, or of fare;
What wished to hear, or what to see—
But there for certain I would be:
Which makes me since suspect and shun
Women for witches every one.
This my position then: I ween
Women all witches—powerful, keen.
That old ones are there 's no debate—
It has been proven by church and state,
A thousand times in conclave high;
King James knew that as well as I,
And sent them off in flames sublime,
By tens and dozens at a time;
The Scripture well the charge allows,
And wo to him that disavows!
This granted, I have nought to do
But prove the young ones witches too.
I'll do it. Whosoever reads
The course and sum of their misdeeds,
Right downward from the primal time
That beauty registered with crime,
Will find that maiden power alone
Can change the church, subvert the throne—
Bring down the conqueror to his knee,
And baffle pomp and pedigree;
Nay, she can nature's self defy—
Make cowards fight and heroes fly;
Draw back the miser from the mine;
And bigot from his holy shrine,
To sins deplored, denounced, and feared;
And lead the prelate by the beard;
Make armies rally or disperse,
And so unhinge the universe;
That man might ween o'er his domain
Nature had dropt the regal rein,
And given up the supreme command
To woman's weak and rring hand.
Alas! what question can there be
That all is downright witcherye?
The patriarchs. I shall mention none,
Save Adam, David, Solomon—
Jacob and Judah's woful thrall—
And mighty Samson, worst of all:
What grief to think such men as they
To woman's eye shall fall a prey,
And that each consequence should be
So fraught with human misery.
Bewitched!—nay, for their onward curse,
They were bedevilled—that was worse!
Such deathless glories to resign,
And ruin bring on all their line.
Mark Antony's and Henry's name
But add unto the list of shame.
And every great man to this day
Has been ensnared as well as they.
Now, dearest maid, art thou content
To yield unto my argument,
That every young and beauteous dame
Hath witchcraft in her earthly frame.
I vouch not that the art 's their own—
Sometimes they have it all unknown,
Lurking in lip or dimple sly,
Or in the amel of the eye.
Then strange it is, and boundless too,
What such bereaving eye can do:
For here was I entranced by one
That wist not what its ray had done,
Or that a glamour undefined,
A spark of an unearthly kind,
Glowed in that mirror of the soul;
But pointing to what distant goal,
Or lighted in what ardent clime,
What sphere of sin or bliss sublime,
Or if a portion of the fall,
Man knows not yet, nor ever shall.
O! I remember still with shame
How oft I conn'd that elfin's name;
Trying it with all sorts of rhymes
A thousand and a thousand times—
With name, with noun, with verb oblique,
In English, Latin, and in Greek:
For, save its cadence to my ear,
No other sound on earth was dear;
And still I tried it as a charm
All grief and dolour to disarm:
For, with her form so slightly slim,
Her slender waist and taper limb,
Her eye and smile of sprightliness,
Nought came to me but genuine bliss.
What fools we are! How weak and vain,
When all is told forthright and plain.
Such my first love! I was oppressed
With something that gave me no rest;
A thrilling, grilling, fervid strife;
A malady I loved as life;
That kept my spirits in a buzz,
And yet I knew not what it was.
I could with ecstacy have gone
And kissed the flower she trod upon;
But not for worlds, in play or freak,
Would I have kissed her dimpled cheek,
Or trained my sordid arms around
The form in which my heart was bound.
Of her as sweetheart, mistress, wife,
I durst not think, even for my life;
I weened all such contamination
Audacious, shameful reprobation.
Well may you ask, as oft did I,
When none but my sage self was nigh,
What with the maiden was your will?
I knew not then, I know not still.
I loved some songs she wont to sing,
The cadence of the tuneful string,
The ground she trod, the air she drew,
The very sound her footsteps threw;
But not to her one word prepense
Unmarked with cold indifference;
While she, of glee and spirits full,
Would slap my cheek and call me dull;
But yet from her I could not stay,
From break of morn till closing day.

You may remember I was blamed
For quarrels without injury named;
For wayward frowardness and feud,
That led to battles and to blood.
Alas! 'twas all my kinsmen knew—
My injuries were not small nor few.
But then they could not well be said;
O'er them was drawn a sacred shade,
From thought and sight their spring to screen—
They rose all from my elfin queen:
For every youth, in fashion bland,
That touched her with unhallowed hand,
Or squeezed her palm even in the dance,
Or wrung a smile by meaning glance,
Aroused within me such an ire,
That nought but blood could quench the fire.
Ah, youthful love! thy votarist,
Though oft he turns thee to a jest,
Thy freaks and follies adventine,
Yet would he worship at thy shrine,
And eulogise thee morn and even,
As the earliest, dearest gift of heaven.
Thou blushing thing of pain and bliss,
Child of a happier sphere than this,
Wert thou a nursling of the sky,
Fostered in paradise on high,
To thrill the radiant breasts above—
No! angels know not youthful love.
Theirs is a flame without compend—
An holy ardour without end.
But ours a joy supreme, intense—
A short and splendid recompense,
For a regard, unbroke, unmoved,
Which man, immortal, might have proved.
Art thou not then, O virtuous love!
The dearest gift of heaven above.
I know thy native home on earth,
The place that owns thy mystic birth;
In grove beneath the golden morn
Was thy seraphic being born—
Where Euphrates and Tygris' strands
Join, 'mid the sweet Arabian lands—
When that great river, rolling blue,
Mirrored the earliest flowers that grew,
When scarce had shrub begun to blow,
Or blossoms decked the world below,—
Then was the shade of tiny tree
The bed of thy nativity.
While the first pair of human frame
Lay weeping their immortal blame,
By deep remorse and sorrow tossed
For all their gifts and glory lost;
While her fair bosom's gentle swell
With hallowed heavings rose and fell.
Thus, Love, thy seraph form was blest
With earthly home of holy rest;
And woman's breast was found to be
The tabernacle meet for thee.
Even then, when grief was at the full,
And no redress their pains to lull,
Thy cherub form from heaven descended,
In all the rays of beauty blended,
And their repentant breasts above
Thou wov'st the holy ties of love;
While, by a mystic art unnamed,
Of thy fair self the bonds were framed;
And never did heavenly art entwine
So sweet, so blest an anodyne.
The two awoke from visioned sleep,
From heavy slumbers long and deep,
And looked abroad on earth and skies
With holy rapture and surprise.
Nature seemed decked in glories new;
The sunbeam kissed the morning dew,
With such a fond and short embrace
As eye before could never trace;
The fields were robed in deeper green;
The blue of heaven was more serene;
Even the twin roses had begun
Their homage to the rising sun,
With bosoms breathing odours meek,
They made obeisance cheek to cheek;—
All seemed renewed—but nought to know
That Love had sought the world below.
But soon the pair thy presence owned!
They found their hearts to nature bound,
By tie not proved or understood,
A bond of kindred and of blood;
And in delight without alloy,
Their hearts rejoiced in nature's joy;
In a new world they seemed to move—
A world of pathos and of love;
The river flowed more sweetly bright;
The flowers seemed glowing with delight;
The birds sang sweeter in the grove,
To hail the natal morn of Love.
But of all ecstasies refined,
The greatest still remained behind.
The lovely pair lay all amazed;
Upon each other ne'er had gazed,
Since first abroad their eyes they threw
On nature's glories robed anew:
Then, O! what heart unmoved can be
At thought of the supreme degree
Of new delight, refined, subdued,
When eye met eye, with love imbued;
What growing beauties still appeared,
As they exchanged looks endeared;
What majesty the fair one saw
In features formed the world to awe,
In mien of dignity innate,
And form to love and venerate:
While he with raptures scarce terrene
First turned his view on nature's queen;
On that dear form, whose softened charms
Besought protection in his arms;
Whose every look, and smile, and sigh
Bespoke a chastened courtesy.
He saw her eye a brighter blue;
Her cheek grown rosier in its hue.

From the London Metropolitan.

OUR OWN OBSERVATION OF THE CONFLAGRATION OF THE TWO HOUSES OF PARLIAMENT.

At about seven o'clock in the evening of the 16th ult. the exciting and ominous cry of "There is a fire!" uttered repeatedly by those hurrying past to the splendid scene, roused us from the quiet of our domestic circle. As we reside in the northern division of the metropolis, we had many streets and much space to traverse before we could approach the burning piles. The rapid walk, the eager run, and, above all, the varied expression of countenance of those who were hastening to the same object as ourselves, would give no faint idea, to those who have been spared such terrible emotions, of a city suddenly beleaguered, or of an approaching army. We saw the look of terror, of wild enjoyment, of wonder, and of admiration, of the different spectators; for, indeed, every face seemed to display the workings of a different passion. Among these varied countenances, we saw many with the sharp hyena look of plunder, and these all bounded by us at full speed. It was evident that their prey was to be found among ruins, and their joy was amidst devastation. As yet no one knew, but

every one had a conjecture, where the place of burning was. "Where is it?" "It is there!" and "there!" and "there!" were the predominating sounds that struck the ear. So suddenly did that brisk red flame burst from the dark and jagged line of the horizon made by the house-tops, that it seemed rather the instantaneous eruption of a volcano, than the usual progress of an urban conflagration.

When we had arrived at Regent-street, where it makes a straight line from the County Fire Office to the park, the view was at once romantic, sublime, and terrific. This splendid street of mercantile palaces, beautifully white on one side, in the bright moonbeams, and on the other grandly yet clearly dark, formed such a fore-ground to the picture, as the happiest talents of the painter never could either have realised or imagined. At the end of this imposing vista, and in the middle distance, stood the statue of the Duke of York proudly upon its proud column, looking calmly upon the voluminous flames. Above the dark foliage of the trees in the park arose the many and monster-tongued flames, which seemed to be moving and twisting, seeking fresh objects to involve in the ravening jaws of destruction. The column stood, looking down Regent street, immediately in the centre, and seemed to divide the conflagration into two parts.

We soon descended the steps in Waterloo Place, and found ourselves, with the on-rushing crowd, in the park. The view here was hardly less grandly beautiful than in Regent street. The clear and placid moon was sailing quietly through the fleecy clouds in her deep blue sky; but the clouds, as they became vertical to the fire, received a brilliant roseate tint, and simulated in the night the glories of a summer dawn. The scenery in St. James's Park, with its elegant piece of water, and its graceful clusters of trees, seemed to belong more to the serenity of the sky above, than to the clamour, riot, and devastation, that was proceeding so terrifically in its neighbourhood.

We left the park at Storey's Gate, and entering George street, we found one side of it brilliantly illuminated by the vivid flames, every thing appearing about it as distinct as in day, yet in a strange coloured light. The flames were glowing apparently amongst the patch of trees at the end of the street, and reminded us, for a moment, of the fiery bush which veiled the Immortal from the gaze of Moses. But the fire was there in appearance only, its intensity always making it appear more near than it really was. We now turned towards the house of commons, and reached as far as the space before St. Margaret's church. How awfully sublime was there the spectacle! That gorgeous building, Westminster Abbey, with its beautifully elaborate chapel, worthy of a great nation, and almost worthy the God to whom it is dedicated, now appeared to be built of columns, pinnacles, and buttresses, of fixed fire. It looked out in a light brighter than that of day, yet most intensely red. Not a curve, an ornament, or a medallion, of that massive structure, but was forced out into a strong relief, and seemed to be stamped in living flame.

At this time, they were throwing out of the windows of the building, opposite where we stood, masses of papers. Many burst and were scattered abroad. Respectable people, as well as blackguards, picked them up, and in their muddy and trodden state, they seemed to be of little value to any one. Many highly respectable persons, unconscious of an offence, picked them up. Being found upon them, they were taken to the police station as prisoners, passed the night there, and when brought before the magistrate next morning, *the papers say*, that all these gentlemen were remanded, and Mr. White refused them the privilege of bail. If this were so, it was a most scandalous transaction. Many of these documents were showered down upon our own person; and nothing prevented us from taking them, at least into our temporary custody, but the idea that they might belong to the Court of Chancery, of which, and of all that belongs to it, we have a phobia truly horrible. These persons were taken into custody before it could possibly be ascertained with what intent they secured the papers that were flung to them.

Not quite liking these proceedings, and the tumult increasing at the place in which we found ourselves, we prepared to decamp, for the engines came down, rattling and thundering over the pavement, regardless of life and limb; then came the dense lines of soldiers, with their heavy tramp, and the jarring of their arms, mingled with the loud shouts of the police, and the louder shouts of the populace; whilst ever and anon was heard the scream of anguish of some poor wretch trod under foot, or crushed by the heavy engines, a sad accompaniment to the authoritative cry of, "Make room for my Lord A." "The Right Hon. Mr. B. this way," &c. Nor were there wanting the jeer, and the laugh of triumph, and the shout of exultation, as the massive burning fragments fell, hurling forth volumes of sparks to the sky.

The state of the public mind, if it be permitted to call a vast majority of the spectators, the public, was any thing but satisfactory to the man of taste, the philanthropist, or the patriot. They saw nothing in all the sublimity before them but a huge bon-fire; they appeared to rejoice in the idea that it would give much annoyance to the higher classes, and they only wished that the fire might extend more and more, in order to heighten their enjoyment. We shall not follow the example of the daily press, and relate the ribald jest, and the exulting jibes that were heard in every quarter around us. It is, however, a consoling reflection to know, that all this came from apparently the most depraved denizens of the most depraved quarter of a vast metropolis.

Having been driven from our former position, we made our way to Palace Yard, and shortly found ourselves directly in the front of, and not far distant from, that venerable and majestic pile, Westminster Hall. The scene here was extremely grand, and, for some time, the crowd not very great. The flames rose from behind the building in one mighty mass, which seemed to occupy the whole square of the range, and to be confined only by the walls. They ascended in terrific grandeur high above the pinnacles of the hall, and floated away to the left, over the river. Here the moon, which was dallying with the rose-tinged clouds directly above the Thames, added much to the singularity of the scene. Sometimes a huge sheet of lurid flame, and fire-charged smoke, would intervene between her and the earth; and then, as if angry at the profanation, she would look through it, her disk changed to a deep blood-red colour; then suddenly there would appear an opening between the volumes, and she would then look smilingly out, in all the purity of her chaste light, and afford a strong contrast of peace above, to the wild riot, confusion, and destruction below. Indeed, the tumult was many-tongued. The crash of the falling timbers, the whirl of the flames, the rushing of the water through a hundred pipes, all were at once blended, and yet distinctly heard, whilst, from time to time, the moaning winds came with a solemn sound over the blazing roofs, and round the heavy buttresses, and among the massive walls, as if they were hymning a dirge to expiring greatness and departing glories. In all these not human

sounds there was something deeply awful, and seemed as distinct from the vulgar clatter and clamour of the mob, as do the solemn notes of the cathedral organ from the squeakings of the itinerant hurdy-gurdy.

The front of Westminster Hall was the grandest feature, where all was painfully grand. It stood up in mourning blackness, as a barrier, beautiful, high, and vast, that kept back the flames from rushing upon the multitude. Through its fine gothic window, in all its maze of tracery, we saw the ignited rafters at the upper end, the window itself appearing in one blaze of light, with every compartment marked out by the densest darkness. The large door below the window was opened, but you saw nothing within, but what appeared to be an unfathomable mistiness of fire. It was as if one looked into a vast furnace, undistinguishable, and filled only with the most consuming heat. Upon the low roofs on the left of the hall, little black things were seen moving busily along, appearing so small and insignificant in that gigantic struggle between the dread angel of fire and the genius of antiquity, that we almost blushed to acknowledge them to be men.

As we were about, urged on by the desperate excitement of the moment, to attempt to make our way into the interior of the hall, that seemed to invite us in to explore its burning mysteries, a great and powerful rush of the blackguardism of London and Westminster, filled in a moment the whole area of Palace Yard. A gentleman, with a lady on each arm, immediately behind us, was seized with a well-founded alarm. The ladies were nearly fainting. In this emergency he appealed to us to take charge of one of the sufferers, and assist him to remove them both from the crowd, and the danger. Heroism was forced to give way to gallantry. We accepted the office, and ultimately succeeded in extricating ourselves and our charge from the *mêlée*. When they were in safety we waited not for their thanks, but immediately returned; but we found the place pre-occupied. We then attempted to gain Westminster bridge, but could not pierce the dense crowd. We tried Parliament street with no better success. Finding ourselves thus defeated in every attempt, we retired, weary and mortified, to supper.

We know that this is but a very imperfect description; but as we wish to preserve the reputation of being honest, we only state what we actually witnessed. In conclusion, we must remark, that we would not have missed this magnificent spectacle on any account, since, for inscrutable purposes, it was ordained to take place; but we never wish to see another like it. The patriotic and spirit-stirring associations connected with the venerable buildings that are no more, can never be destroyed. The monuments have perished that commemorated them; but we trust that spirit that makes us mourn over, and honour them, will never die. We shall soon see structures as noble arise, and England will never want worthy sons to fill them.

My Sketch Book. No. V. By George Cruikshank. Tilt. 1834.

Friend George is as bold, as broad, and as brilliant as ever. A Chapter on Noses, The Worship of Wealth, Matthews at Home, and the Emancipation of the Negroes, are the materials from which he has furnished one of the most humorous and laughable divisions of his work.—*The Court Journal.*

From the Asiatic Journal.

MR. GUTZLAFF'S HISTORY OF CHINA.*

A history of China has been long wanted, and now, that our intercourse with that country is likely to become enlarged, it is a want which will be severely felt. When Mr. Gutzlaff's work was announced, we were disposed to rejoice that an individual so competent, in many respects, had applied himself to the task of supplying this deficiency. Although Mr. Gutzlaff may not have had time and opportunity, amidst his various and absorbing occupations during the few years he has been in China, to make very extensive incursions into the boundless regions of its literature, he has enjoyed peculiar facilities for completing an accurate portraiture of the Chinese people, by means of his journeys in the maritime parts of the empire, the free manner in which he has mixed with all classes of the Chinese, and his surprising proficiency in the dialects of China.

However reluctant we may be to discharge an office at all times invidious, and especially so towards a person for whom we feel respect, obligations of public duty compel us to say that this work has grievously disappointed us. It is a hasty compilation, essentially superficial, put together apparently to meet a sudden demand, and little calculated to confer upon its author any literary reputation. We can discover very few traces of original research; Chinese authorities are, indeed, occasionally referred to, but the bulk of the historical summary is evidently taken at second-hand, and might have been manufactured by an ordinary compiler, with a small expenditure of time and industry, out of the copious materials of the Jesuit missionaries.

After some slender and superficial "geographical remarks," we have a chapter upon "government and laws," in which scarcely any thing is said of the former; and all we are told of the latter is, that "many of the Chinese laws are very excellent, others extremely defective; but they are in general too minute." The "character, usages, industry, language, sciences, and religion" of the Chinese, all points of much interest, constitute the topics of another chapter of sixteen pages, (the prolific subject of religion occupying *two*,) in which we have rarely seen the epitomizing system carried more sternly into execution: we defy any person, previously ignorant of Chinese matters, to form any distinct images or ideas in his mind respecting either of the topics in this chapter. Then comes an account of the Chinese system of chronology, which is comprised in a few lines from Du Halde, giving a brief explanation of the commencement and division of the year,—the chronological system of the Chinese being left totally unnoticed,—to which is added a list of the periods or epochs of Chinese history, with

---

* A Sketch of Chinese History, Ancient and Modern; comprising a Retrospect of the Foreign Intercourse and Trade with China. Illustrated by a new and corrected Map of the Empire. By the Rev. Chas. Gutzlaff, now, and for many years past, resident in that country. Two vols. London, 1834. Smith, Elder, & Co.

the names of the sovereigns and the dates of their respective reigns.

Mr. Gutzlaff divides the history of China, conveniently and properly enough, into four eras,—the mythological era, that of ancient history, the middle ages, and the modern history. The first is disposed of without much ceremony. As a genuine history of real occurrences, it deserves no better treatment; but as the source of most of the Chinese maxims of government, politics, religion, science, and even manners and domestic economy, it ought to engage the close attention of the historian of China, who would find, with a little pains and diligence, that the Confucian books are not so barren of resources for this purpose as Mr. Gutzlaff seems to think them. He gives us, however, little beyond a dry narrative of the incidents recorded in the reigns of Fuh-he, Shin-nung, Hwang-te, and his successors down to Shun.

The ancient history, from the Hea dynasty to that of Han, B. C. 2207 to A. D. 263, is of course treated more fully, being, perhaps, as copious a digest as this portion of the Chinese annals requires. But no practical or useful conclusions are drawn; the narrative is diversified only by unsatisfactory references to sacred history, and by an account of Confucius and his works, of Laoutsze, and Mang-tsze, which may stand as a model to those who desire to communicate as little information as possible in a given number of "good set words."

The history of the middle ages, which fills a large portion of the first volume, is a crude summary of incidents rapidly noticed. We have nothing to object to this cursory mode of treating most of the transactions in this period, but some are of more importance than to be hastily and summarily dismissed. The introduction and growth of Buddhism and other religious systems, the inventions, the arts, &c., which distinguish this period of eleven centuries, deserve some attention: Mr. Gutzlaff has spared them none.

The modern history, the materials for which are copious and accessible, has a very parsimonious measure of justice dealt to it: a chapter at the end, entitled "conclusion," of nineteen pages, adds some meagre details respecting the institutions of China.

Then follow—a long chapter of eighty pages on the "propagation of the Gospel in China;" a short chapter on "foreign intercourse with China;" and four chapters, two hundred and forty pages, entitled "emporiums," being an account of the modern intercourse of European nations with China. There is nothing new, either in matter or mode of treatment, in any part of these long disquisitions, which seem extended for no other purpose than to swell out a second volume. The account of the English intercourse contains a prolix narrative of the last embassy to Peking, and all the rigmarole of the trumpery disputes with the Canton authorities under the reign of the sagacious Mr. Baynes. The appendix consists of an extract from the *Calcutta Government Gazette* of 1825, giving long particulars of the presentation of a petition by the private merchants to the chief magistrate of Canton,—for what earthly purpose inserted it is difficult to conceive,—and a set of tables respecting the trade of the British and Americans at Canton, mostly copied from the appendices to the reports of the East-India Committees.

Of the "new and corrected map," in mercy to Mr. Gutzlaff, we say nothing.

It is unnecessary to examine the work more at length, or to point out its lamentable deficiencies; a few of them we have indicated *en passant*. We say, with unfeigned regret, that Mr. Gutzlaff would have acted more judiciously and beneficially, for his own literary reputation and for the service of the public, if he had taken more time in composing his historical sketch of China, and forborne to publish an expensive work which imparts little or no information.

Slight Reminiscences of the Rhine, Switzerland, and a Corner of Italy. 2 vols. 8vo. London, 1834.

If Sterne had extended his amusing notice from travellers to books of travels, he would have found variety quite as great, and classification rather more difficult. There is in them as much diversity as in works of imagination; and we cannot take up a poem or new novel with more uncertainty as to the character of its contents, than the last new record of a foreign tour. Between the best and the worst every class of literature there is of course a vast difference; but we are speaking of the varieties, not of excellence, but of style. Exclude the bad—take only the good, and what dissimilarity do we still find! The same compartment of a classified library comprises Humboldt's "Personal Narrative," and "Matthew's Diary of an Invalid"—both good of their kind—yet how unlike! A person who professed a preference for travels, and was equally pleased with these two excellent productions, could scarcely be accused of an exclusive taste. These works, it is true, do not belong to the same class—but, even in the same, what dissimilarity! Look at two journalising tourists in the same country. How compare the light and easy fluency of Matthews, with the terse epigrammatic pedantry of Forsyth! and which again of these can we place in the same category with the diffuse and languid Eustace? As well could we match the attractive inaccuracies of the enthusiastic and eloquent Clarke with the dull fidelity of Coxe; or the sententious wisdom of Johnson's "Tour to the Hebrides," with the froth of Carr's "Caledonian Sketches." In attempting to classify books of travels, we shall find that in all of them one of two styles prevails —the historical, or the personal. They are either descriptions of the visited country, in which the author himself is little prominent, or they are records of his feelings and adventures. Of these two kinds the latter is generally to be preferred. It is to be preferred, not on account of its egotism —for nothing that deserves that obnoxious name is necessarily inherent in a personal narrative—but for the sake of the stricter fidelity and vividness of effect which such a narrative is likely to insure. A model among works of this kind was

the Journal of the lamented Bishop Heber—a free current of unlaboured truth, flowing sparklingly and unostentatiously,—adorned in its course by the candour, the benevolence, the acuteness, the sound judgment, and the poetical fancy of that distinguished writer. To rival in every respect its unstudied merits would demand an equality of talent. To attain excellences similar in *degree* may not be possible; yet may it serve to show what they should be in *kind*. Works of this description do not always sufficiently possess the distinctive qualities of their class. When the journal borrows from the commonplace-book, and is prodigal in quotations—when it evinces an ambition to display rather what the traveller has read than what he has observed—when instead of the brief and apposite reflection naturally suggested by the passing occurrence, it includes elaborate disquisitions—when the *limæ labor* is apparent,—then has it deviated from its true province, and it is no longer good of its kind. A journal should be, what that name implies—a record of daily impressions. It should convey to us the sight that was seen, the tale that was heard, the emotion that was felt, the reflection that was suggested—set down at once in all their freshness—and even (if it so be) in all their inaccuracy. The impression of the moment will have a bloom and vividness which tardy recollections hardly ever can bestow. As for their inaccuracy—even if they are hasty opinions, which the writer afterwards finds cause to change, yet will they still possess one species of accuracy. They will be genuine records of the actual effect produced at the time on the mind of the traveller. The impression may be erroneous; yet that it was produced is a positive fact, which, though less valuable than many others, is not unimportant, and far from being uninteresting.

If we could imagine ourselves sitting in judgment upon a foreign nation, or writing the history of a country or people, we ought to desire a careful and impartial deduction from the well-sifted evidence of numerous pens. We should want, rather the average truth than the best statement of a single case. But if we eschew the painful process of investigation and comparison, and desire only the immediate gratification derived from the reception of new ideas, give us the single narrative fresh from the pen of an intelligent witness, who possesses the art of communicating his impressions, of placing us in his position, and making us see, hear, and feel in fancy, what he saw, heard, and felt in reality. Such narratives, compared with general statements, are what pictures are to plans. In each instance what the former gains in individuality, it also gains in vividness and force. It conveys less knowledge of the whole, but a more lively comprehension of a particular part. It is interesting, for instance, to examine a plan of Rome, or designs and measurements of its architectural remains. But for our pleasure, give us rather a single picture which should make us feel that we are seeing all that was seen from that one spot, by the artist who painted it—that even so looked that deep blue line of distant hills—that even so rose that stately ruin, distinct and clear against an azure sky—that even so emerged that identical fragment of a marble shaft from amidst that graceful cluster of acanthus.

The knowledge of all that may be learned through the generalities of comprehensive description, comes to us not with half the pleasure which we derive from being able to station ourselves in imagination by the side of the traveller, and witness the identical scene and circumstance which is called into being by his pen or pencil. The present year has been fertile in works which, in a greater or less degree, have afforded this gratification. Some are recommended principally by the information they convey; others less by what they tell than by the manner in which they tell it. Such is that agreeable volume, "Bubbles from the Brunnens of Nassau," by Sir Francis Head; such, too, is the very entertaining work before us, modestly entitled "Slight Reminiscences." We learn from the preface that an incorrect edition of all, except the supplementary chapters, was printed at Paris for private distribution in 1830. The authoress (for it is by a female hand) also thus apologises for its supposed deficiencies.

"If it has any merit, it is that of truth; for I am not conscious of having noted down any thing which I have not looked at with my own eyes; though I may perhaps have seen sunbeams, where others saw shadows,—or the contrary.

"I have had no advantage of encouragement or advice, no literary friend or counsellor, none to interest themselves in my success, or to be mortified by my failure, beyond the precincts of my own fireside. My notes have never been submitted to any other eyes than those too partial to be critical; they are probably full of inaccuracies, and perhaps of repetitions. I have no skill in composition, nor opportunity of referring to any judgment but one which affection renders fallible; if I had, they might be better. As it is, I must trust to the gentle virtue of indulgence, without venturing to count upon the more encouraging sentiment of approbation."

The humility of these apologies will be thought overweening; and the authoress is deprecating a severity of criticism which she is not likely to incur. Rarely have we seen a work, which, without either interesting the feelings, or augmenting our knowledge, renders itself so acceptable as a companion. It is not much easier to describe what constitutes an agreeable book—a book which we treat as *society*, and take up by way of relaxation to while away a vacant hour—than to define that felicitous combination of social qualities which constitute an agreeable companion. One may enumerate good-humour, tact, wit, information, the alternating lights and shadows of the serious and the sportive vein—of trifles and learning—of imagination and reflection; but when one has summoned up all these elements, one finds that it is but a cold inexpressive catalogue, and that the subtle essence, the general effect of all combined, is that which, however felt, can scarcely be described. So is there in this work a charm, of which an enumeration of its component qualities will not afford an adequate idea. Yet the existence of this charm must not be taken upon trust, without some attempt being made to show in what it consists. Vivacity, variety, a felicitous command of descriptive language—a power of painting by a well-chosen

epithet, and of vividly illustrating by a pointed allusion—an ever lively interest in the passing scene—a graceful enthusiasm, not so intense and absorbing as to tax our sympathies too severely—a happy tact in never dwelling too long on any circumstance, though always seeming to describe it fully—much pleasantry introduced, not as if it was meant for wit, but naturally interwoven with the thread of the discourse—and, to shade and relieve these lighter qualities, a frequent vein of grave reflection—these are among the attractive qualities which give this work a high place among agreeable specimens of *light reading*. The style is negligent, and not always grammatical; but it is always sparkling and expressive. It has faults which care and experience could remove, and merits which mere care and experience could never give. One great source of our pleasure in reading it is, we believe, a sense of its sincerity. It seems to be the genuine expression of what the writer saw and thought, and written not under the influence of that chilling interval which the ill-chosen word "reminiscence" implies, but as if at once committed to paper with all the glow of the immediate impression; ere the excited feeling had subsided, or the scene vanished from the mental eye. It has also, if it is not the result of recollection, the advantage of awakening recollections in others. It is, fortunately for its popularity in this locomotive age, addressed rather to the travelled many, than to the untravelled few; and gratifies, by laying before us, not scenes which the reader has never witnessed, but by reproducing, in all their freshness, those which lay dormant in the memory until awakened into life by a graphic description. Who that has ever been at Genoa will fail to recognise the following picture, and to feel assured that the eye of the writer has dwelt on all that she describes?

"A hum and bustle (indications of the vicinity of a great city rather unusual in this lovely country) tell us that we approach Genoa. It is not indeed a bustle of equipages, nor even of stage coaches, but a coming and going of carts laden with merchandise, of muleteers with loose jackets into which the arms seldom enter, and hats thrown on one side of the head over the gay coloured night-cap, trudging slowly after their fine animals, or riding sideways on the least heavily laden of the file; of peasant girls (very fine creatures sometimes), with natural flowers placed carelessly in the hair, and a dash of powder occasionally thrown in with them; and nearer to the town, plying carriages with three windows at each side, full of gay girls fanning themselves violently in their charming white veils, which make even the plain look pretty, and swarthy men less smartly dressed than their brisk companions; boys playing at mora, soldiers looking on, and sandaled friars with nothing symptomatic of contrition about them but the hempen girdle,—jolly full-blown souls, whose very looks carry absolution with them, and testify to the fidelity of some at least of Boccaccio's sketches. At last comes Genoa, bursting at once upon the sight, and most magnificently,—with a gay dazzle about its white palaces and glittering basin, original and splendid: I do not know why it should be compared to Naples; it appears to me to have quite another character; it has not Capri, nor Ischia, nor Procida,—the purple islands of that beautiful bay,—nor the great Vesuvius, nor the classical recollections that hang upon Baia and Puzzuoli, Missena, and Sorrentum, but it has a strong and striking character of its own. A noble amphitheatre proudly decorated, a sweeping bay full of movement, where ships from all parts of the Levant, from the Ionian isles, from the shores of Sicily and Greece, from countries whose very name has witchcraft in them, lie at anchor, sending their busy hum into the streets of the city; boats gliding between the larger vessels, villas rising upon terraces, fortresses upon the hills, and life every where.

"So far, so good; but when we desired to be driven to the Hôtel des Quatre Nations, we were told that we could not get up to it in a carriage. We unpacked ourselves grumblingly, in the middle of a lane, as full of mire and oranges as Lower Thames Street; and after dabbling through one or two passages of most forbidding aspect, reached the hotel. The first peep was highly characteristic. A saloon of handsome dimensions, with gilding and mirrors, hangings of light blue satin damask, and a brick floor encrusted with dirt, looking down upon a sort of terrace projecting sufficiently to shut out the street, and furnished with mutilated statues, and boxes filled with scrubby orange trees. Beyond this terrace a narrow rampart, with idle sailors in the red cap of the Levant, and jackets of all shades, from chocolate to saffron, lounging as sailors always lounge, from Blackwall to the Mola at Naples, with their hands stuck in their sides and their backs against the parapet, looking out for spots in the horizon."

A sketch of the town of Novi is also a good specimen of that union of fidelity and spirit which gives such value to the descriptive portions.

"Novi itself is like every town of the same modest calibre in this part of Italy. Thin long streets, slanting roofs, coffee-houses with wide curtains drawn before the sashless windows (a fashion shared with the barber and some other small crafts), poor shops meagrely furnished with the minor articles of fashionable life, and profusely with fruit, macaroni, flax, Parmasan cheese, aquavitæ, rosolio, and vino d'ogni qualità; and, jammed in between every five or six of high pretensions, the little indispensable one, where pease, flour, and grain of various kinds, heaped on plates, or piled up in wooden bowls, are retailed to the humble purchaser. But here too is a piazza painted all over, houses covered with angels and cherubs, fruit and flowers, pilasters and balconies, mixed up with allegorical subjects rather laboriously executed, and headed by a church splashed and dotted with yellow and green paint, in coarse imitation of the green and yellow *antico*. Every roof is clustered with chimneys of various and graceful forms (chimneys in Italy are a picturesque feature), and in the centre of the place is a marble fountain, round which are gathered women in white veils, cheapening melons, nuts, tomatos, figs, and the red unnatural looking mushroom, which the people here have the courage to eat, though it smells like soap and looks like a mouldy toad. In one corner is a peasant with naked legs, stained deeply with the red juice of the vintage grape, buying long stripes of something looking like an omelet, fried on a tin plate as large as a millstone. In another, an old woman with saucer eyes and a witch's headgear, cowers over a pan of smoking chestnuts, while three or four of his Sardinian majesty's liveried loungers keep an eye on the noisy squabblers who are unloading their donkeys on the pavement, and battling for precedence for their capsicum pods and cabbages."

The following is similar in character; but the scene is in another region; and the concluding passage affords an instance of agreeable transition from description to reflection, and the apt introduction of appropriate thoughts:—

"Passed through Offenberg triumphantly, steeds flying, whips cracking, post-boys with large bunches of artificial roses spread out in their hats. But, alas! for the evanescence of human glory;—snap went a spring when we were a mile from the town, and here we are back again for the day, and the night too, getting all that we can in the way of entertainment out of a market (the markets are a benediction to us to-day), rich in costumes, grotesque and gorgeous as eye can desire—the women ugly, in velvet caps, so arranged as to produce the same effect as the nets worn by the *Trasteverine* at Rome, but the men incomparable. Wide skirted coats of some dark colour (occasionally black velvet), lined with white or scarlet, thrown open so as to display a red, or very bright green waistcoat, with embroidered braces (white or black) worn outside the splendid vest; a large cocked hat, gallantly thrown off from the front of the head, or soberly flapped before, and the toilet finished by a spruce nosegay in the button-hole. The younger beaus sometimes adopt the flat, low-crowned beaver, with a few flowers, or a peacock's feather, or a velvet band and silver buckle. We were amused at seeing the carters driving from the saddle,—three-cornered hats, flowing skirts and all, looking like the worthy burghers of Quidlenburg, or Sir Walter Raleigh in the Critic, degraded to the management of a dray-horse.

"The road as we left Offenberg was brimful of life, and sabbath finery. Every hive pouring out its swarm, all with prayer-books in their hands, and nosegays in their bosoms. Many of the young men were very handsome; bold, but not vulgar; but the females have no longer the finely developed shapes of the Rhenish nymphs. The narrow shoulders, thick waist, and squat proportions of Switzerland already proclaim its vicinity. However, they looked clear and shining; no economy of soap either on linen or faces, and much sobriety of deportment. No straggling curl,—every hair alive with the spirit of premeditated mischief, or glance shot slily in the incarnate thirst of conquest; but all trim and straightforward, with that kind of coarse pre-concerted primness easily (time and season permitting) converted into heavy mirth. Much of Teniers, but nothing of Albano.

"But even without the colouring of poetry, there is something delightful in the repose of a village sabbath. Its chastened gaiety affects and soothes the heart; duties performed and comfort received, prepare the mind for gladness; and the very feeling of liberty and quiet after six days' labour, is in itself positive enjoyment. The stated occurrence too of duly anticipated recreation, counted upon with certainty and enjoyed with confidence in its assured return, has a charm that monotony cannot destroy, and which to a mind unaccustomed to strong excitement, is, perhaps, as powerful as that of novelty itself."

The wild and wonderful scenery of the Handeck is thus treated:—

"At every step as we advanced towards the Handeck the scene blackened, and the road, or rather track, always alarmingly bad, became almost awfully so. At length the roaring of the cataract made itself heard above the surrounding torrents; we alighted from our horses, and a few minutes' walk brought us within view of this sublime exuberance of nature. But the front view is not the finest; it is from the upper ledge, where the eye takes in at once both the headlong Aar, leaping exultingly from its rocky bondage, and burying itself in the vanishing depths below, and the mountain torrent that comes down laughing and sparkling, and throwing about its shower of pulverised diamonds, mixing and contrasting their whiteness with the troubled foam of the great waters, that the scene is developed in all its lonely glory. I have heard it said that the accompaniments are defective, but I cannot think so; surely the stern defile, the awful depth of perpendicular rock, the scathed pine, and the eternal glacier, become it well; like the desolation that frames in Rome, and accords so finely with its ruins and its recollections. No pastoral valley, no peopled glen, or sunny upland, however lovely in its brightness, could combine so *feelingly* with the lonely Handeck, as the stony desert in which nothing but itself has life, or the stern chaos of rocks that crowd about it, like the unshapen elements of a just awakened world."

The descriptions are sometimes rendered at once more vivid and more amusing, by the playfulness with which they are touched; as in this moonlight scene on the Simplon:—

"We did not reach the village of Simplon till two hours after night-fall. Fortunately we were guided by a bright moon—harvest or hunter's, I known not which;—but its melancholy, beautiful light lay upon the cold snow mountains, and transformed all the uprooted trunks and half prostrate trees into forms which St. Anthony would have called temptations, (we have other notions on that subject now,) horns, hoofs, and all, famously got up. I think I recognised Mephistopheles, and saw a score or two of saucer eyes glaring through the branches; but I am sure of a griffin, and an army of long-horned chimeras, with a white woman standing by the side of a torrent, and pointing upwards."

In the following passages the authoress displays, both her command of descriptive language, and her correct sense of the insufficiency of words, to do full justice to the magnificence of nature:—

"It were endless to dwell on the scenery of the Lucerne lake. Its superb gulfs, its bays of gentler beauty, magnificent outlines, and soft details, cannot be brought by words to the mind's eye. The best descriptive painter raises but a vague and unidentified idea, even when he delineates objects similar in their general character to those with which we are habitually familiar. What then can words do for a scene that looks like a fragment of a world, made for something more exalted than man? For notwithstanding all which the most philosophic of princes has said, touching the "paragon of animals," he looks but punily here, contrasted with the colossal bearing of inanimate nature.

"Poor little Gersau! it can no longer boast its unsapped republic; but it has woods and mountains which the higher powers of the canton of Schwytz cannot take from it,—and quiet homes (the word *home* ought to be Swiss, as well as English), and sunny creeks, with boats drawn up into them, and trees, and chalets, falling just in the right places, and making sweet miniatures, each in its own appropriate setting.

"But above all, the sunset!—our young party will, I think, never forget it. The gloom of the mountain background, on which the purple twilight was already gathering,—the radiance of the nearer scene,—rocks catching the red light, which, as it fell upon their kindling masses, seemed to force them out from their clinging drapery of pines,—the lake glittering like liquid fire, and the sky like a temple in which angels might hold their jubilees. As darkness came on, the promontories seemed to detach themselves from the main land, and to advance into the lake, where they stood darkly and firmly, taking the form of islands as the back screen gradually receded from them, and was lost in the shroud of night.

"But again I feel how meagre is the gorgeousness of words, when we would embody the bright casualties of nature in her moments of glory! Poor cobweb,—at least in common hands,—yet I have it in my heart, and in my fancy; but when I try to fix it, it flies off, and will not be whistled back again."

"No words can arrest the shifting aspects, or present a living likeness of the exquisite combinations of nature. We say 'this is beautiful, that is superb,' we exhaust the vocabulary of superlatives, without conveying to others the image with which we are ourselves impressed, even in its faintest tracings. The pencil is more effective than the pen. While the most laborious details and the truest local colouring fail in giving individuality to a description, the scenery of the Mediterranean ports, and the ineffable colouring of Italian skies have been thrown with such bright fidelity upon canvass, that the eye at once acknowledges the living originals of all which the pencil of Claude has imbedded in the memory. The same light dances on the waters, the same delicious coast brightens in the same golden sunbeams. It is not that objects are recalled, they are recognised, just as at Venice, where one finds that to be familiar with Canaletti's views, is almost to have seen the thing itself. In short, painted scenery, if faithful, is like a well executed portrait, and description like a black profile; it may serve to recall a well known face, but can convey no idea of one to which we are strangers."

One of the captivating qualities of this work, is the hearty spirit of enjoyment with which the writer enters into the pleasures of traveling; and especially of that elevated species of pleasure which springs from the contemplation of natural scenery. There is an acute sense of the ridiculous and the disagreeable, but there is also an intense appreciation of the grand and beautiful. If we do not always agree with the authoress on points of taste, we can never accuse her of morbid fastidiousness; nor do we find that she ever seems ashamed of admitting how thoroughly she has been pleased. See, for example, this glowing narrative of a day passed in one of the most enchanting spots that even Italy can produce:—

"Passed the whole day—and such a day!—in the Serbelloni gardens. My brother brought up his sunny mind and charming susceptibility of enjoyment, Mr. M. his store of thought and knowledge, and we our happy hearts and joyous feelings. Our host of Belaggio, too, brought up something rarely overlooked, even in the most sentimental moments: an excellent dinner, which we were kindly allowed to place in a saloon looking on both branches of the lake, and all the necromancy of its shores. Three large windows open upon beds of flowers, and arcades covered with the foliage of plants that are exotics with us; beyond these gay parterres a bank swells upward, hung with the contrasting verdure of the oak, the olive, the tall spare cypress, and the softer green of many summer trees; and higher than all, the feathery outline of the Scotish fir, appears firmly traced on a clear blue sky, while its bark glows and reddens in the evening sun.

"A door opens from this charming saloon on a truly Italian vista. Stone steps rising in perspective, and shaded by broad laurels, through which the sunbeams dart slantingly, chequering at intervals the grassy openings. Large vases, from which cape jessamine and heliotrope diffuse their foreign odours, are placed at regular distances. Aloes grow as weeds do with us, and many of the sharp and broad-leaved things, which we cherish in our hot-houses, shoot out or trail along here with an untutored luxuriance that shows them indigenous. Indeed all rare and beautiful things seem to be so in this soft Arcadia.

"What a spot to sit in, and talk over happy subjects, as we did. Mr. M—— dwelt on our village ramble with delight; it had interested him, as simple scenes of strong character always interest highly intellectual minds. All the fine things about us had sharpened our appetites; we found our carp and beccaficos, our grapes and truffles, figs and coffee, the most delicious that we had ever tasted, and sat talking down the sun until the sweet evening air tempted us out again,—and then we lingered amongst the vineyards, and on the platform before the old castle, till the bats came wheeling round us, and the red lights had faded entirely from the tops of the mountains;—when we descended to our sleeping quarters, some running, others lagging, but all agreeing that we had passed a day not soon to be forgotten.

"While the scenes of this morning are yet impressed in all their living sweetness on my memory, I sit at my window and think what a summer paradise this would be to live in. Better even than Interlacken,—more uninterrupted quiet, and a softer colouring. Nothing ever approached the colouring of the hill countries in Italy. In Switzerland, nature cuts with a harder chisel,—grandly,—magnificently,—but perhaps too distinctly. Here the undefined outline melting into the sky and mingling with it, takes the vague shading which may be called the sentiment of landscape,—the poetic distance, that gives an impulse to the mind, and sends it bounding forward far beyond the narrow sphere of actual vision. How delightful it would be to live like sea gipsies, floating all day long upon the lake,—steering up to Gravedona, and growing poetical amongst the mountains,—cheating the hot hours in the shade of Lechino, where the sun never shines, or under the fig-trees of Cavagnola, or loitering out the cooler ones on some of those balmy terraces "où les citronniers fleurissent." Then, if the gay fit prompt, or the musical one, dropping down to Como, and passing the evening with Tancredi, or the gentle Desdemona; and should this whet the appetite for finer things, driving on to Milan, to meet them again on higher ground, or to shudder with La Pallarina, or sit down before the Hagar of the Brera, and think what hard hearts they had in Canaan. Delightful it would be, with health to enjoy and friends to share it;—with such blessings, O what a gift is life! when we are wise and grateful enough not to abuse it."

We have mentioned with commendation the occurrence of passages interspersed with reflections arising naturally from the circumstances narrated, and giving at once elevation and variety to the general character of the narrative. Take, for example, the following on the love of nature:

"I always find the rhetoric of nature more heart-stirring than that of the schools, and I believe the love of nature is one of the affections which linger longest in the heart. How strongly, as we advance in life, is the vanity of those things which we most prized in youth made manifest; what importance have we given to untried joys and distinctions, and even to the lightest trifles,—a little while, and the most solid amongst them seem like old toys not worth playing with. We find that feelings, opinions, modes, and even hearts change,—every thing but nature: she alone is immutable, and for that reason her spells are often the last broken. We confide in her promises, and know that she will never deceive us; every thing may be false—hope, love, beauty, friendship, fame,—but nature never. If we sow an acorn by the side of a grave, we are sure that an acorn will overshadow it; if we return to the country of our birth, changed and forgotten, we find the same hills and streams, and even the same flowers—if man has not disturbed them—which we loved in childhood. Pæstum has still its roses, though its tombs have long been swallowed up in the general oblivion. These are the reasons why the love of nature has been known to ripen in the heart amidst the ashes of other, and once warmer, feelings. We love, and lean on things that we know will not break

down, or forsake us. Of others—even those which flatter us most—we can too often spell the duration; but we are sure of nature, for she must outlive ourselves."

Such, too, are these brief comments upon natural scenery:—

"Light is the physiognomy of scenery; a landscape is like a regular set of features—both may be good, but neither speak, unless the light of nature or of the mind brighten on them."

* * * * * * * *

"Montesquieu was right: the monotony of contrasts becomes at the long run as fatiguing as that of symmetry. The power of contrast consists in the shock, or charm, of opposition, and the excitement of surprise; but when its effects are too regularly repeated, they weary like the voice of an echo, which at first astonishes and delights, but soon loses its charm when we become aware of its unfailing return. It seems ungrateful to find fault with nature in this divine country, but the oppositions of colouring (for instance) fatigue like sameness, and in the end become so."

An incident witnessed in an Italian church introduces remarks which, if not original, are at least just and well expressed:—

"I love the Italian churches, with their broad aisles, vast and unfrittered,—no pews, no divisions, no aristocratical screenings; all kneeling together, the high and mighty and the lowly, on the same pavement; all sending up their thanksgiving, or their prayer, to the same great Being in whose eyes all are equal. No dread of vulgar contact, no elbowing of the tattered penitent. I shall never forget the impression made upon me, on my first visit to St. Peter's at Rome, by a young lady who came into the church, folded up in a cachemere, and followed by a servant in gorgeous livery: her appearance was that of a *petite maitresse*, as far as dress was concerned, but her air was devout and collected; she passed on slowly to the illuminated shrine of the saint, and inserted herself amidst a group of masons in their working dresses, kneeling with them on the pavement, and praying earnestly. This was beautiful, and similar acts of humility are performed every hour in the day in every church in Italy.

"Principles are better things than impulses, even when both are good. Religion in this country seems less a principle than a feeling; it does not appear to influence the moral conduct,—but for the period during which its forms are exercised, the abstraction seems deep and real. Whether the visible image of the saint or virgin then implored be not the paramount object of adoration, may be questioned, and probably the zeal awakened through the medium of the imagination can only be sustained by the same means. The interceding saint, protecting madonna, or familiar image, long known, and long revered,—implored in sorrow, and relied upon in repentance, receives the fervent homage of the tender and devout. The enlightened may see in these palpable forms only a memorial, and while kneeling before a terrible crucifix, may lift up their souls to the Divine Nature, triumphing over sin and death, or send out their thoughts from the foot of the decorated altar to Him whose "way is on the sea, and his path on the great waters." But the vulgar,—"the great vulgar and the small,"—do they look beyond the identical picture or statue (always invested with miraculous powers)?—I should doubt it."

She has been alarmed by a false report, and says:—

"All well to-day, 'pas un mot de Caron,' the canon died of an old invincible phthisic, and the raging fever was the invention of our showman. The vulgar in all countries love to frighten the credulous. It is an exercise of power,—an indulgence prohibited in general by their position in society,—and they particularly love to exert it over their minds to whose will they are by condition subservient."

The three principal personages in the *Nouvelle Heloise*, are well characterised as "that philosophical, rhapsodical, unnatural, and most eloquent trio, who discussed virtue as a problem, and found that its solution was a vice;" and Rousseau's eloquent exaggerations are thus amusingly noticed:—

"When that illustrious visionary, Jean Jacques, got hold of an idea, how he hugged and fondled it, and dressed it up in colours snatched from that palette which now lies buried, with all its dewy freshness, in his tomb. No one since has found it; other writers use live tints, and bright ones too,—but his touch was magical. The poor Valaisannes on whom he lavished his delicious colouring, are wretched realities, and may take rank amongst the least dangerous of the fair sex. One comes amongst them, seeking under every little hat for the charming face; and peering at every tinselled jacket for the light shape, which St. Preux, even while the fair form of the impassioned Julia floated before his mind's eye, found so perplexingly lovely, and a squalid half-awake race, disfigured by goitres which they show off as our women do white teeth or ivory fingers, presents itself. I should think the most fire-and-tow *garde-du-corps* in the service of his majesty Charles Dix, might dine in perfect tranquillity of heart, though waited upon by a legion of such damsels as the leaden-eyed she, who is at this moment laying a log of wood upon the fire."

National characteristics appear to have been acutely observed; and we find the following lively and sensible remarks upon the difficulty of estimating them correctly:—

"Joined the table d'hôte party to-day upon principle, wishing to see a little of the manners of Heidelberg, though it must be confessed that its usually mixed society can afford but an imperfect criterion. However, if it does not give us the Corinthian capitals, it at least offers flying sketches of men and manners, and those are all that a stranger can ever hope to seize. In fact, we birds of passage can form no positive judgment on any point susceptible of fluctuation. We look at society through a kaleidoscope; a jog to the right or to the left scatters our materials just as we are preparing to sketch from them, and no twisting or turning can bring back the same pattern again; while stationary people fix their microscopes firmly, fasten their subject before them, and dissect it at their leisure. After all, our grand error is, that, instead of looking through our own eyes and judging by our own impressions, we run to our books of reference, pinning our faith on other men's sleeves, without considering how time and season, sunshine and rain, bile and blue devils, alter matters. It is like judging of a nation by an individual, a thing so often done dictatorially and senselessly too. 'He's knight o' the shire, and represents them all,' is a common presumption, and always goes down."

Here follows a sketch of German students, and a comparison of them with the same class in France.

"An eye of defiance, an exulting step, an intrepid carriage, are the marks and tokens of a German student. This audacious bearing is strengthened and set off by the open collar, short frock, (generally of Lincoln green, and of Robin Hood's own cut), small casquette, the point pressing flatly on the forehead, and hair cropped like Giotto's or Cimabue's apostles, floating or bristling at

each side of the face. These 'chartered libertines,' for such they are during their collegiate life, run a course of unbridled riot, mastering the quieter classes of society by their force and number: to be formidable seems their point of honour, and they sustain it fiercely. Many of these swaggerers are certainly of an age to have long since finished their studies, and others curl their angry mustaches as if they had already smelt powder, and were 'fit for treason, stratagem, or strife.' Indeed, their general appearance is more that of lawless desperadoes, robbers of the cave and forest, than of dwellers in the quiet groves of Academus; and yet these same students, when absent from their universities, appear to be persons of peaceful and respectable habits, earnest in the pursuit of knowledge, and often battling courageously for its attainment in the very teeth of poverty and its concomitant disadvantages.

* * * * * *

"The fearless, lawless air of a German student bespeaks a man who dreams of equality of station and unlimited license, and who will bluster about his rights and expectances boldly and fiercely, at least while the heyday of youth lasts. His mind is like his dress, manly and fanciful, but the black cravated student of the *pays latin* shows in his thoughtful eye, and abstracted yet ardent look, the spirit that never dies, the absorbing hope which clings to the heart through life, and never loses sight of the indemnifying moment. Perhaps the cause of an observation frequently made, that a German youth, on quitting college, soon forgets the day-dream of liberty, the projected efforts of patriotism which have amused his boyhood, and quietly settles into the peaceful subject of some petty prince, while a Frenchman who has once taken a political bias, rarely sobers down into the pliant and contented citizen of a government inimical to his early opinions and feelings, may be traced to the different positions of their respective countries. The one, a member of a vast empire divided into many states, more or less powerful, can never hope to see the different portions of his variously ruled country united under one enlightened and paternal system of government, while from the still and unpartitioned state of France, every Frenchman looks to one central point, from which a constitution, inspired by the love of liberty, and matured by wisdom, —a constitution, affording equal protection and equal advantages to all, may emanate."

Of the Italians, she says,—

"The Italian character has great breadth and raciness, and a fine natural colouring, never sullied by affectation; not but they are tricking too in their way, but their cunning goes straight forward to its aim, and is never wasted on points of display or vanity,—things which rarely enter into an Italian head. Fashion, whose laws are in England a kind of interior police, by which our most domestic concerns are regulated, has little influence here; the Italians, as Madame de Staël has observed with her usual skill in character, 'ne font rien, parce qu'on les regarde, et ne s'abstiennent de rien, parce qu'on les regarde.'

* * * * * *

"Unquestionably the Italians are the noisiest people in Europe,—singing like angels, and talking (as far as voice is concerned) like traffickers in fish or charcoal, the ear knows not whether it seizes the notes of a prima donna, or of a macaroni vender. Last night, a party from Milan, (capital gentry, our hostess said,) who were either convivial or quarrelsome till an unreasonably late hour, put sleep quite out of the question,—such shouting, —such screaming,—a dozen voices raised together, and sustained with incredible power of lungs,—each striving to maintain the upper key, but a sharp female treble always *lady* of the ascendant. And then the hostess, with soft, sweet eyes, and a delicate outline, raving like an infuriated bacchante, and even the little girl of the bodkins throwing in a note. It is extraordinary that a people whose song is all passionate tenderness,—all soul, —all sweetness,—should have frequently the speaking voices of porters and oyster women. Yet they are a kind, good-tempered people,—not rough, I think, in any thing but their voices. I have seen instances of flexible mildness in Italy, that were really edifying."

What is said on the unpoetical temperament of the Swiss, is not new; but it is well expressed:

"The Swiss are an excellent people,—calm, religious, lovers of order, good citizens, worthy of liberty, and strong to maintain it. But they are neither poets nor painters. A country that might

"Create a soul,
Under the ribs of death,"

seems to act like a wet blanket on the fancy. A man naturally imaginative, but who has always lived in the world, may perhaps be more sensible of the soul *stirring* marvels of nature when they suddenly open on him, than one who has grown up in the midst of her familiar and unheeded riches, though he may not prize or love them with such home feelings. But I am surprised that the constant intimacy with scenes and objects of infinite beauty and splendour, does not give an habitual colouring of poetry to the mind. I can comprehend why a man of acute understanding, liberal education, and studious habits, but unaccustomed to society or the intercourse of the world, may fail in the developement of the passions. Man's nature is intricate, and must be studied intensely. He who would lay open the magnificent structure of the human mind, must watch it through the changeful phases of active life, and meditate what he has there marked in the stillness of solitude, with the door barred upon the world and its distractions. But nature is more communicative than man; she spreads open her page, and he who will may read its ample characters, and catch light and inspiration from them. But light comes not here, nor inspiration either. Why it does not is a problem, the solution of which I leave to others."

There is not much allusion to works of art; but there is enough to show an appreciation of their merits, unmixed with the cant of connoisseurship. Michael Angelo and Caravaggio are well distinguished;—

"In the chapel is a Pieta (basso relievo) by Michael Angelo, full of beauty and expression. This powerful master was not often tender, but he could be so; the proof is here. I once knew a clever man who greatly admired Caravaggio, and used to place him on a line with Michael Angelo. Caravaggio, too, was a genius, one full of strong, broad-shouldered ideas; a perturbed and gloomy spirit, throwing his dark soul out upon his canvass with startling effect; but he did not think or feel like Michael Angelo; his genius was not sublime; he painted like a coarse bad man, of monstrous capacity, but not like one who had unsealed the book of judgment, or lifted up the Pantheon and hung it in the air."

The following remarks on the works of two celebrated portrait-painters are equally just;—

"Genoa is rich in living portraits,—portraits that one dares not trust with a secret. I should as soon think of conspiring against the state, before the "reverend signiors" of the assembled senate, as in the presence of those lofty Dorias or Durazzi, or even of their gentle wives, who look and listen till you feel almost confused at having discussed their charms as it were in their hearing. Vandyke was a powerful master; few have possessed in a higher degree the art of giving vitality to

their portraits. Unlike the glossy monotony of Sir Peter Lely, (whose courtly shepherdesses are all as like each other as the fifty daughters of Danaus, in the melodrame,) his personages have the air of life so freshly on them, that when we see the same portraits a second time, it is like meeting old acquaintances, family people with whom one has lived in friendly intercourse. We contract an intimacy with them, as we do with the dramatis personæ of Sir Walter Scott's novels. Who that has ever contemplated Vandyke's portrait of Charles I., but fancies he has seen and known that melancholy visage? or read Rob Roy, without the conviction of having been personally acquainted with Bailie Jarvie?"

We are tempted to extend our quotations to some of the many short anecdotes and lively sketches which meet our eye at every turn; but we should mar their effect, if we were to take them out of their setting. We differ from the authoress on some subjects; but they are either not sufficiently important to demand discussion, or too extensive for the slight notice which our limits will afford. As an instance of the former, we would say that she has not done justice to the beauties of Heidelberg; of the latter, that she over-rates the beneficence of Napoleon's sway in Italy. We complain, too, of occasional sentimental deviations from that good sense which characterises the greater part of the work. To be shocked at finding a spacious comfortable boarding house at Nonnenwerth, and a steam-boat on the Lake of Como, is neither sensible nor original. Any mawkish twaddler can put in a claim to fine feeling by such fastidious agonies as these. Nor is there much of either wisdom or taste in the following passage:—

"What a country for the geologist!—but to me who know nothing of the *ologies*; who am altogether ignorant of the sweet science and mystery of lichens; to whom gypsum is Hebrew, and who can hardly tell limestone from sandstone; to me, in short, who dare not mention the word strata, and have no other name for the starved yellow flower that represents Flora in this bleak region, than mere marigold; it is only a gray desert, long, and drear, and uniform, but solemn and original,—a chaotic and forgotten nature, made and left in anger."

This is too much like that tone of mock humility, in which persons, immeasurably inferior to this writer, try to avert the imputation of some species of knowledge of which they have no chance of being accused, and of which, could the charge be proved, they would have reason to be proud. Neither geology nor botany are such despicable sciences, that to possess a knowledge of the one or the other, need lower the authoress in her own estimation, or in that of any rational person. We must also observe, that the fertility of her fancy, while indulging in simile and illustration, sometimes leads her into those prettinesses which are best expressed by the Italian word "concetti;" and sometimes, to use the words of Sheridan, we have tropes and metaphors almost as plentiful as nouns-substantive. We may farther notice, among minor errors, the unusual employment of certain words—such as "original," and "benediction." The former is more than once oddly applied to natural scenery; and the latter still more strangely. "A little gunpowder," she says, "judiciously applied to a few of the flaming red, red houses, that stare at one every where, and put out the eyes with their effrontery of brick-dust, would be a benediction.' There are benedictions for the ears, too. At an opera at Lucerne, she says, "never was noise as loud, yet so merciless;—a dozen kettle-drums would have been a benediction.' The same serviceable word may be found masquerading in other places, and with the same disregard of its every day meaning. We notice this, because an inclination to disregard the usual import of words is too observable in other instances. Here end our censures—and we conclude with a cordial recommendation of this work as one that will animate the untraveled by its promises, and gratify the traveled by the recollections it awakens.

WHY DON'T THE MEN PROPOSE?

BY THOMAS HAYNES BAYLEY.

Why don't the men propose, mamma?
Why don't the men propose?
Each seems just coming to the point,
And then away he goes!
It is no fault of yours, mamma,
That ev'ry body knows;
You *fete* the finest men in town,
Yet, oh! they won't propose!

I'm sure I've done my best, mamma,
To make a proper match;
For coronets and eldest sons
I'm ever on the watch;
I've hopes when some *distingué* beau
A glance upon me throws;
But though he'll dance, and smile, and flirt,
Alas! he won't propose!

I've tried to win by languishing
And dressing like a blue;
I've bought big books, and talk'd of them
As if I'd read them through!
With hair cropp'd like a man, I've felt
The heads of all the beaux;
But Spurzheim could not touch their *hearts*,
And, oh! they won't propose!

I threw aside the books, and thought
That ignorance was bliss;
I felt convinced that men preferred
A simple sort of Miss;
And so I lisp'd out naught beyond
Plain "yeses" or plain "noes,"
And wore a sweet unmeaning smile;
Yet, oh! they won't propose!

Last night at Lady Ramble's rout,
I heard Sir Harry Gale
Exclaim, "Now I *propose* again;"
I started, turning pale;
I really thought my time was come,
I blush'd like any rose;
But, oh! I found 'twas only at
Ecarté he'd *propose!*

And what is to be done, mamma?
Oh! what is to be done?
I really have no time to lose,
For I am thirty-one:
At balls I am too often left
Where spinsters sit in rows;
Why won't the men propose, mamma?
Why *won't* the men propose?

From the London Examiner.

France; Social, Literary, and Political. By Henry Lytton Bulwer, Esq., M. P. Bentley, 1834.*

Mr. Henry Bulwer has lived much in France, and enjoyed ample opportunities of studying the people. The present book, we are assured, is the result of many years' observation of them; and a very clever, sparkling, amusing, and instructive book it is,—abounding in curious anecdote, keen remark, and valuable information throughout. But it is somewhat rambling and confessedly incomplete. The rambling character, indeed, is the necessary result of the plan adopted by the author of treating his subjects in the order in which they were suggested to himself—a plan which, considering the wayward nature of mental associations, is one, to say the least, of very doubtful propriety; though it has enabled him to infuse a spirit and a power into portions of his work, which would otherwise most probably have been found wanting in such qualities. The book is incomplete, because it was found impossible to comprise the matter within the limits originally proposed; but other volumes are to follow, devoted to subjects (as the church, the army, the law, the chambers, &c. &c.) unavoidably omitted in those before us; in which the main object of the author has been "to bring a people upon the stage, to show what they have been and what they are." A glance at the contents will show in what manner he has attempted to do this.

He begins by a dashing sketch of the exterior of the capital: the Champs Elysées, the Boulevards, the Palais Royal, the Quais, the Tuileries, &c., are made to pass before us, and the historical recollections connected with them are called up. We have then the characteristics of the people—their politeness, gallantry, wit, gaiety, and crime: for, after exhibiting the Parisians in their pleasures, Mr. Bulwer, by a happy and impressive transition, proceeds to deduce precisely similar conclusions from their crimes. These two divisions constitute the first book. The second, entitled "Historical Changes," contains an able resumé of French history, from 1789 till now. The third book, entitled "Predominant Influences," treats of female influence, military influence, and literary influence, and concludes with detailed critical accounts of some of the most celebrated modern historical and dramatic authors of France. There are also an introductory analysis and an appendix, containing much valuable statistical information relating to population, revenue, measurement, exports, imports, births, deaths, &c. The style is rapid, abrupt, declamatory, irregular—occasionally deficient in clearness from too eagerly aiming at point, but seldom unattractive, and never wearisome or dull;—the style, in short, of a clever man of excitable temperament, more used to debate and conversation than to the pen. We are not aware that we can give a more characteristic extract than the following, which forms the opening chapter of the work:—

"It is by the Thames that the stranger should enter London. The broad breast of the great river, black with the huge masses that float upon its crowded waters; the tall fabrics, gaunt and drear, that line its melancholy shores; the thick gloom through which you dimly catch the shadowy outline of these gigantic forms; the marvellous quiet with which you glide by the dark phantoms of her power into the mart of nations; the sadness, the silence, the vastness, the obscurity, of all things around, prepare you for a grave and solemn magnificence. Full upon your soul is shadowed the sombre character of 'the golden city;' deep into your thoughts is breathed the genius of the great and gloomy people, whose gloom and whose greatness are, perchance, alike owing to the restless workings of a stern imagination. Behold St. Katharine's docks, and Walker's soap manufactory, and 'Hardy's Shades!' Lo! there is the strength, the industry, and the pleasure—the pleasure of the enterprising, the money-making, the dark-spirited, people of England! 'Hardy's Shades!'—singular appellation for the spot dedicated to festivity. Such is the entrance into London by the Thames.

"Let us change the scene, reader! You are at Paris!

"To enter Paris with advantage, you should enter it by the Champs Elysées. Visiting, for the first time, the capital of a military nation, you should pass under the arch built to commemorate its reign of victories. Coming to dwell among the most gay and light-hearted people in the universe, you ought at once to rush upon them in the midst of their festivities. Enter Paris, then, by the Champs Elysées! Here are the monuments that speak to you of the great soldiers; and here the *guinguettes* that display to you the great dancers of Europe. You pass by the old gardens of Beaujon; you find the *caserne* (and this tells you a good deal of the nation you are come to visit) intermingled with *cafés* and *salons littéraires;* and you see the chairs under the trees, and the open spaces left for the ball; and if you stop to read an advertisement, it will talk of the *Chevaux mécaniques*, and of the *Bal paré*, and of the *Concert des Champs Elysées;* and the sun shines upon the golden cupola of the stately Invalides, and on the glittering accoutrements of the sauntering soldier; and before you are the Tuileries, with their trees and terraces, which yonder misplaced monument cannot quite conceal; and to your right are the Seine and the chamber of deputies; and to your left the Corinthian architecture of those palaces that form the Rue de Rivoli. The tri-coloured flag floats from the gates of the royal gardens; the military uniform, mixed up with the colouring of every passing group, enriches it with its deep blue and its bright scarlet. The movement about you is universal—equipages of all kinds are passing in all directions; the movement is universal, but differing from that you are accustomed to in England; the movement is the movement of idleness and of pleasure; an indescribable mirth reigns in all you see, and the busy gaiety of Paris bursts upon you with the same effect as the glad brightness of Italy. The people, too, have all the habits of a people of the sun—they are not the people of one stock; collected in every crowd are the features and the feelings of divers races and different regions. In Paris you are not *in the climate of Paris.* France is brought into a focus, and, concentrated in the capital; you find all the varieties that vivify the many provinces of the kingdom. It is this which gives a city of the north the gracious and agreeable aspect of the south, and transports the manners that are legitimate to the olives and the myrtles of Provence, to the elms of the Champs Elysées and the Boulevards. London is the city of the English, as Constantinople is the city of the Turks. Paris is the city of Europe: it unites, more than any city in the world, the wants of a variety of classes, the habits of a variety of people. With the snow, you have the sledge of St. Petersburg; with the summer, the music, the nightly promenade, the ice, the lemonade, and all-but the sea and sky of Naples.

* Republished by Harper and brothers, New York.

"I am now at the corner of the Rue de la Paix. It is a beautiful autumnal evening. What a dazzling confusion of colours and images! white houses, green trees, and glittering lights! The rattling equipage rushes by me; the whispering saunterer lounges before; and the group is seated round the *café*; and the music is far enough away to lose all harshness; and in the background—behold! the piles of buildings, and the lines of lamps, rising one above the other, and broken at intervals by some dark mass of verdure. It is almost impossible to describe the scene, and as impossible to gaze upon it without inhaling some portion of the spirit it breathes, without feeling a character more soft and southern—a ray of light that had not penetrated there before, stealing into the severe and sombre recesses of one's northern imagination. Here it is most especially that the Boulevards justify the old French proverb, which says, 'When *le bon Dieu* is out of humour, he opens one of the windows of heaven, and recovers his spirits by a glimpse of this long line of trees.' There is certainly nothing that I know of like the Boulevards in any other city in the world."

He subsequently hurries us through most of the city in the same manner; nor could he have adopted a better mode of bringing us acquainted with the inhabitants, for—

"If you want to know the people of Paris, you must seek them abroad. They love the sun, and the air, and the sauntering stroll; they love, if it be only for a moment, to glide across the broad street, amidst the turnings and windings of which society changes its colours at every instant, like the shifting forms of a kaleidoscope: the idle loiter there for amusement, the busy steal there for distraction. Besides, it is not only the present I have been showing you. I do not know where you may better study the past. What has not even our own generation looked on from yonder windows? Robespierre, Barras, Bonaparte, the Republic, the Directory, the Empire, have all passed in triumph and defeat before them."

We are in the habit of regarding the French as, *par eminence*, polite. In Mr. H. Bulwer's opinion they are no longer so, and he thus endeavours to account for the change:—

"The manners of the French in the time of Louis 16th had one feature of similarity with ours at present. A monied aristocracy was then rising into power in France, as a monied aristocracy is now rising into power in England. *This is the aristocracy which demands obsequious servility—which is jealous and fearful of being treated with disrespect. This is the aristocracy which measures, with an uncertain eye, the height of an acquaintance. This is the aristocracy which cuts and sneers.* This aristocracy, though the aristocracy of the revolution of July, is now too powerless in France to be more than vulgar in its pretensions. French manners, then, if they are not gracious, are, at all events, not insolent; while ours, unhappily, testify on one hand, the insolence, while they do not, on the other, represent the talent and the grace of that society which presided over the later suppers of the old regime. We have no Monsieur de Fitz-James, who might be rolled in a gutter all his life, as was said by a beautiful woman of his time, 'without ever contracting a spot of dirt!' We have no Monsieur de Narbonne, who stops in the fiercest of a duel to pick up the ruffled rose that had slipped, in a careless moment, from his lips during the graceful conflict! You see no longer in France that noble air, that 'great manner,' as it was called, by which the old nobility strove to keep up the distinction between themselves and their worse-born associates, to the last, and which, of course, those associates most assiduously imitated.

"The manner is gone; the French, so far from a polite people at the present day, want that easiness of behaviour which is the first essential to politeness. Every man you meet is occupied in maintaining his dignity, and talks to you of his position. There is an evident effort and struggle, I will not say, to appear better than you are, but to appear all that you are, and to allow no person to think that you consider him better than you. Persons, no longer ranked by classes, take each, by themselves, an individual place in society. They are so many atoms, not forming a congruous or harmonious whole. They are too apt to strut forward, singly, and to say, with a great deal of action and a great deal of emphasis, 'I am nobody.'"

There are some pleasant anecdotes in the Chapter on Gallantry; and, in that on Vanity, Mr. Bulwer has unsparingly exposed and admirably illustrated the wondrous workings of this master motive, this weakness, madness, yet sometimes virtue, of the French.

"You find this vanity the predominating genius of the camp, the court, the counter—it reigns no less at the Bourse, the Morgue, or the prison. The Frenchman wishes to live with ostentation;* if he cannot do this, he does not care whether he lives or not. Like most passions, this vanity is good and bad, little and great, now sublime, now ridiculous; but upon the whole, perhaps, it appears in France as more good than bad, more great than little, even more sublime than ridiculous. Absurd in the drawing-room, fatal in darker scenes, it has made the French army the most renowned in the world, and the French nation the most united. But it has also made of the French a people eminently volatile: eager for changes that promise much, disgusted with utility that cannot boast show, and impatient of plans that run in a slow and quiet course to their perfection."

We regret that we have no space to dwell upon the Chapters on Influences, peculiarly rich in matter for reflection as they appear to us; but we must take the liberty of expressing a doubt as to the justice of the parallel, drawn by Mr. H. Bulwer, (here adopting the view taken in *England and the English*,) between the relative positions in society of the literary man of England and of France. According to him, literature in France is the surest and quickest road to the highest distinctions; the successful writer is fêted by wealth, caressed by beauty, trusted by the people, and decorated by the king—whilst in England he is scorned, calumniated, or, at best, neglected, by all four; in proof of which somewhat startling proposition, we are told of the election of M. Thiers, M. de la Martine, and M. Arago, to the Chamber of Deputies, as contrasted with Mr. Babbage's rejection by the electors of Finsbury, and of the certainty of our meeting "all the literary men who belong to all the different political opinions, at Madame D——'s, at Madame de M——'s, at Madame de R——'s" (these ladies must have large houses); whilst such, we are assured, is the degraded state of the same class in England, that "a good-natured young English nobleman told one of Mr. B.'s French acquaintances that

* In 1810, a notaire's clerk killed himself, leaving a piece of paper behind him, on which he declared that, having duly calculated and considered, he did not think it possible for him to be so great a man as Napoleon—therefore he put an end to his existence.

dancers and singers were perfectly well received in English society, but no men of letters."

Against this anecdote of a nameless young English nobleman, whom, from his designation of "good-natured," we take to be a fool, we beg leave to place the following anecdote of a young French nobleman, who certainly is not a fool. M. le Vicomte de la Martine, on being asked some question relating to Béranger by a distinguished Englishman, replied, that he had little acquaintance with men of letters, and knew nothing personally of the individual in question. This is fact, and we request Mr. H. Bulwer to explain why M. de la Martine was guilty of this piece of dandyism, if literature be a recommendation in the exclusive coteries of France. The truth is, there still exists in both countries a silly set of exclusives, who vote every thing of a *demonstrative* character,—such as genius, learning, talent, &c.,—a bore. The crowds of lords, and ladies, and honourables, ambitious of appearing in print, prove that the prejudice even in this favoured set is rapidly disappearing in England; but we look in vain for similar symptoms of a corresponding spirit of improvement in France. Certain French houses of fashion receive authors —certain English houses of fashion do the same; Mr. Babbage was lately rejected by the electors of a populous department of London, and M. Charles Dupin was rejected not long ago by a populous department of Paris. As to the number of literary men in the Chambers, it is at present remarkably small, and proves incontestably that literary men are chosen by the people in both countries, not merely as literary men, but in proportion as their studies have been of a character to acquire them political celebrity, or as they themselves are qualified by nature or fortune to attract popular favour in other modes than by their books. The subject, in its full extent, is one which we may hereafter make the subject of an article; we are now merely protesting against what appears to us to be a misstatement (no doubt involuntary) as to facts. For the present we take leave of it in the firm conviction, that, though Mr. H. Bulwer belongs, by birth and circumstances, to that class of society in which (as he tells us) "to be known as a writer is certainly to your prejudice," he will gain, instead of losing, even in their estimation by this book, and find the electors of Coventry more proud than ever to be represented by him.

From the New Monthly Magazine.

TRANSLATION FROM THE GREEK ANTHOLOGY.

ARCHIUS.*

On a statue of the nymph Echo.

Pan's comrade, she who dwells amongst the rocks,
Echo, the nymph whose song the singer mocks
With his own notes made softer,—mimic gay,
Who keeps the laughing shepherd-boy at play,
The vocal mirror, as it were, of sounds
Who sends their image back with true rebounds,
Here is she—this her statue! To it say
Whate'er you will, your greeting she'll repay.

* The friend of Cicero.

From the London Metropolitan.

JAPHET IN SEARCH OF A FATHER.

Those who may be pleased to honour these pages with a perusal, will not be detained with a long history of my birth, parentage, and education. The very title implies that at this period of my memoirs I was ignorant of the two first; and it will be necessary for the due developement of my narrative, that I allow you to remain in the same state of bliss; for in the perusal of a novel, as well as in the pilgrimage of life, ignorance of the future may truly be considered as the greatest source of happiness. The little that was known at this time, I will, however, narrate as concisely, and as correctly, as I am able. It was on the night——I really forget the date, and must rise from my chair, look for a key, open a closet, and then open an iron safe to hunt over a pile of papers—it will detain you too long—it will be suffieient to say that it was on a night—but whether the night was dark or moonlit, or rainy or foggy, or cloudy or fine, or starlight, I really cannot tell; but it is of no very great consequence. Well, it was on a night about the hour—— there again I'm puzzled, it might have been ten, or eleven, or twelve, or between any of these hours; nay, it might have been past midnight, and far advancing to the morning, for what I know to the contrary. The reader must excuse an infant of——there again I am at a nonplus; but we will assume of some days old—if, when wrapped up in flannel and in a covered basket, and, moreover, fast asleep at the time, he does not exactly observe the state of the weather, and the time by the church clock. I never before was aware of the great importance of dates in telling a story; but it is now too late to recover these facts, which have been swept away into oblivion by the broad wing of Time. I must therefore just tell the little I do know, trusting to the reader's good nature, and to blanks. It is as follows:—that at the hour ——of the night——the state of the weather being also ——I, an infant of a certain age——was suspended by somebody or somebodies——at the knocker of the Foundling Hospital. Having made me fast, the said somebody or somebodies rang a peal upon the bell, which made the old porter start up in so great a hurry, that with the back of his hand he hit his better half a blow on the nose, occasioning a great suffusion of blood from that organ, and a still greater pouring forth of invectives from the organ immediately below it.

All this having been effected by the said peal on the bell, the said somebody or somebodies did incontinently take to their heels, and disappear long before the old porter could pull his legs through his nether garments and obey the rude summons. At last the old man swang open the gate, and the basket swang across his nose; he went in again for a knife and cut me down, for it was cruel to hang a baby of a few days old; carried me into the lodge, lighted a candle, and opened the basket. Thus did I metaphorically first come to light.

When he opened the basket I opened my eyes, and although I did not observe it, the old woman was standing at the table in very light attire, sponging her nose over a basin.

"Verily, a pretty babe with black eyes!" exclaimed the old man, in a tremulous voice.

"Black eyes, indeed," muttered the old woman. "I shall have two to-morrow."

"Beautiful black eyes, indeed!" continued the old man.

"Terrible black eyes, for sartain," continued the old woman, as she sponged away.

"Poor thing, it must be cold," murmured the old porter.

"Warrant I catch my death a-cold," muttered the wife.

"But, dear me, here's a paper!" exclaimed the old man.

"Vinegar and brown paper," echoed the old woman.

"Addressed to the governors of the hospital," continued the porter.

"Apply to the dispenser of the hospital," continued his wife.

"And sealed," said he.

"Get it healed," said she.

"The linen is good; it must be the child of no poor people. Who knows?"—soliloquised the old man.

"My poor nose!" exclaimed the old woman.

"I must take it to the nurses, and the letter I will give to-morrow," said the old porter, winding up his portion of this double soliloquy, and tottering away with the basket and your humble servant across the court-yard.

"There it will do now," said the old wife, wiping her face on a towel, and regaining her bed, in which she was soon joined by her husband, and they finished their nap without any further interruption during that night.

The next morning I was reported and examined, and the letter addressed to the governors was opened and read. It was laconic, but still, as most things laconic are, very much to the point.

"This child was born in wedlock—he is to be named Japhet. When circumstances permit, he will be reclaimed."

But there was a postscript by Abraham Newland, Esq., promising to pay the bearer on demand the sum of fifty pounds. In plainer terms, there was a bank note to that amount enclosed in the letter. As in general, the parties who suspend children in baskets, have long before suspended cash payments, or, at all events, forget to suspend them on the baskets, my arrival created no little noise, to which I added my share, until I obtained a share of the breast of a young woman, who, like Charity, suckled two or three babies at one time.

We have preparatory schools all over the kingdom; for young gentlemen, from three to five years of age, under ladies, and from four to seven, under either, or both sexes, as it may happen; but the most preparatory of all preparatory schools, is certainly the Foundling Hospital, which takes in its pupils, if they are sent, from one to three days old, or even hours, if the parents are in such extreme anxiety about their education. Here it commences with their weaning, when they are instructed in the mystery of devouring pap; next they are taught to walk—and as soon as they can walk—to sit still; to talk—and as soon as they can talk—to hold their tongues; thus are they instructed and passed on from one part of the establishment to another, until they finally are passed out of its gates, to get on in the world, with the advantage of some education, and the still further advantage of having no father or mother to provide for, or relatives to pester them with their necessities. It was so with me: I arrived at the age of fourteen, and notwithstanding the promise contained in the letter, it appeared that circumstances did *not* permit of my being reclaimed. But I had a great advantage over the other inmates of the hospital; the fifty pounds sent with me was not added to the funds of the establishment, but generously employed for my benefit by the governors, who were pleased with my conduct, and thought highly of my abilities. Instead of being bound 'prentice to a cordwainer, or some other mechanic, by the influence of the governors, added to the fifty pounds and interest, as a premium, I was taken by an apothecary, who engaged to bring me up to the profession. And now, that I am out of the Foundling, we must not travel quite so fast.

The practitioner who thus took me by the hand was a Mr. Phineas Cophagus, whose shop was most conveniently situated for business, one side of the shop looking upon Smithfield Market, the other presenting a surface of glass to the principal street leading out of the same market. It was a *corner* house, but not in a *corner*. On each side of the shop were two gin establishments, and next to them were two public-houses and two eating-houses, frequented by graziers, butchers, and drovers. Did the men drink so much as to quarrel in their cups, who was so handy to plaster up the broken heads as Mr. Cophagus? Did a fat grazier eat himself into an apoplexy, how very convenient was the ready lancet of Mr. Cophagus. Did a bull gore a man, Mr. Cophagus appeared with his diachylon and lint. Did an ox frighten a lady, it was in the back parlour of Mr. Cophagus that she was recovered from her syncope. Market days were a sure market to my master; and if an overdriven beast knocked down others, it only helped to set him on his legs. Our windows suffered occasionally; but whether it was broken heads, or broken limbs, or broken windows, they were well paid for. Every one suffered but Mr. Phineas Cophagus, who never suffered a patient to escape him. The shop had the usual allowance of green, yellow, and blue bottles; and in hot weather, from our vicinity, we were visited by no small proportion of blue-bottle flies. We had a white horse in one window, and a brown horse in the other, to announce to the drovers that we supplied horse-medicines. And we had all the patent medicines in the known world, even to the "all sufficient medicine for mankind" of Mr. Enouy; having which, I wondered, on my first arrival, why we troubled ourselves about any others. The shop was large, and at the back part there was a most capacious iron mortar, with a pestle to correspond. The first floor was tenanted by Mr. Cophagus, who was a bachelor, the second floor was let; the others were appropriated to the housekeeper, and to those who formed the establishment. In this well-situated tenement, Mr. Cophagus got on swimmingly. I will therefore, for the present, sink the shop, that my master may rise in the estimation of the reader, when I describe his person and his qualifications.

Mr. Phineas Cophagus might have been about forty-five years of age when I first had the honour of an introduction to him in the receiving room of the Foundling Hospital. He was of the middle height, his face was thin, his nose very much hooked, his eyes small and peering, with a good-humoured twinkle in them, his mouth large, and drawn down at one corner. He was stout in his body, and carried a considerable protuberance before him, which he was in the habit of patting with his left hand very complacently; but although stout in his body, his legs were mere spindles, so that, in his appearance, he reminded you of some bird of the crane genus. Indeed I may say, that his whole figure gave you just such an appearance as an orange might do, had it taken to itself a couple of pieces of tobacco pipes as vehicles of locomotion. He was dressed in a black coat and waistcoat, white cravat and high collar to his shirt, blue cotton-net pantaloons and Hessian boots, both fitting so tight, that it appeared as if he was proud of his spindle shanks. His hat was broad-brimmed and low, and he carried a stout black cane with a gold top in his right hand, almost always raising the gold top to his nose when he spoke, just as we see doctors represented at a consultation in the caricature prints. But if his figure was strange, his language and manners were still more so. He spoke, as some birds fly, in jerks, intermixing his words, for he never completed a whole sentence, with *um—um*—and ending it with "*so on*," leaving his hearers to supply the context from the heads of his discourse. Almost always in motion, he generally changed his position as soon as he had finished speaking, walking to any other part of the room, with his cane to his nose, and his head cocked on one side, with a self-sufficient tiptoe gait. When I was ushered into his presence, he was standing with two of the governors. "This is the lad," said one of them, "his name is *Japhet*."

"Japhet," replied Mr. Cophagus; "um, scriptural—Shem, Ham, um—and so on. Boy reads?"

"Very well, and writes a very good hand. He is a very good boy, Mr. Cophagus."

"Read—write—spell—good, and *so on*. Bring him up—rudiments—spatula—write labels—um—M. D. one of these days—make a man of him—and so on," said this strange personage, walking round and round me with his cane to his nose, and scrutinizing my person with his twinkling eyes. I was dismissed after this examination and approval, and the next day, dressed in a plain suit of clothes, was delivered by the porter at the shop of Mr. Phineas Cophagus, who was not at home when I arrived. A tall, fresh coloured, but hectic looking young man, stood behind the counter, making up prescriptions, and a dirty lad, about thirteen years old, was standing near with his basket to deliver the medicines to the several addresses, as soon as they were ready. The young man behind the counter, whose name was Brookes, was within eighteen months of serving his time, when his friends intended to establish him on his own account, and this was the reason which induced Mr. Cophagus to take me, that I might learn the business, and supply his place when he left. Mr. Brookes was a very quiet, amiable person, kind to me and the other boy who carried out the medicines, and who had been taken by Mr Cophagus for his food and raiment. The porter told Mr. Brookes who I was, and left me. "Do you think that you will like to be an apothecary?" said Mr. Brookes to me, with a benevolent smile.

"Yes; I do not see why I should not," replied I.

"Stop a moment," said the lad who was waiting with the basket, looking archly at me, "you havn't got through your *rudimans* yet."

"Hold your tongue, Timothy," said Mr. Brookes. "That you are not very fond of the rudiments, as Mr. Cophagus calls them, is very clear. Now walk off as fast as you can with these medicines, sir—14, Spring Street; 16, Cleaver Street, as before; and then to John Street, 55, Mrs. Smith's. Do you understand?"

"To be sure I do—can't I read? I reads all the directions, and all your Latin stuff into the bargain—all your summen dusses, horez, diez, cockly hairy. I mean to set up for myself one of these days."

"I'll knock you down one of these days, Mr. Timothy, if you stay so long as you do, looking at the print shops; that you may depend upon."

"I keep up all my learning that way," replied Timothy, walking off with his load, turning his head round and laughing at me, as he quitted the shop. Mr. Brookes smiled, but said nothing.

As Timothy went out, in came Mr. Cophagus. "Heh! Japhet. I see," said he, putting up his cane, "nothing to do—bad—must work—um—and so on. Mr. Brookes—boy learn rudiments—good—and so on." Hereupon Mr. Cophagus took his cane from his nose, pointed to the large iron mortar, and then walked away into the back parlour. Mr. Brookes understood his master, if I did not. He wiped out the mortar, threw in some drugs, and, showing me how to use the pestle, left me to my work. In half an hour I discovered why it was that Timothy had such an objection to what Mr. Cophagus facetiously termed the *rudiments* of the profession. It was dreadful hard work for a boy; the perspiration ran down me in streams, and I could hardly lift my arms. When Mr. Cophagus passed through the shop and looked at me, as I continued to thump away with the heavy iron pestle, "Good,"—said he, "by and by—M. D.—and so on." I thought it was a very rough road to such preferment, and I stopped to take a little breath. "By the by—Japhet—Christian name—and so on—sirname—heh!"

"Mr. Cophagus wishes to know your other name," said Mr. Brookes, interpreting.

I have omitted to acquaint the reader that sirnames as well as Christian names, are always given to the children at the Foundling, and in consequence of the bank note found in my basket, I had been named after the celebrated personage whose signature it bore. "Newland is my other name, sir," replied I.

"Newland—heh!—very good name—every body likes to see that name—and have plenty of them in his pockets too—um—very comfortable—and so on," replied Mr. Cophagus, leaving the shop.

I resumed my thumping occupation, when Timothy returned with his empty basket. He laughed when he saw me at work. "Well, how do you like the rudimans?—and so on—heh!" said he, mimicking Mr. Cophagus.

"Not overmuch," replied I, wiping my face.

"That was my job before you came. I have been more than a year, and never have got out of those rudimans yet, and I suppose I never shall."

Mr. Brookes, perceiving that I was tired, desired me to leave off, an order which I gladly obeyed, and I took my seat in a corner of the shop.

"There," said Timothy, laying down his basket; "no more work for me, *hanty prandium*, is there, Mr. Brookes?"

"No, Tim; but *post prandium*, you'll *post* off again."

Dinner being ready, and Mr. Cophagus having returned, he and Mr. Brookes went into the back parlour, leaving Timothy and me in the shop to announce customers. And I shall take this opportunity of introducing Mr. Timothy more particularly, as he will play a very conspicuous part in this narrative. Timothy was short in stature for his age, but very strongly built. He had an oval face, with a very dark complexion, grey eyes flashing from under their long eyelashes, and eyebrows nearly meeting each other. He was marked with the small pox, not so much as to disfigure him, but still it was very perceptible when near to him. His countenance was always lighted up with merriment; there was such a happy, devil-may-care expression in his face that you liked him the first minute that you were in his company, and I was intimate with him immediately.

"I say, Japhet," said he, "where did you come from?"

"The Foundling," replied I.

"Then you have no friends or relations."

"If I have, I do not know where to find them," replied I, very gravely.

"Pooh! don't be grave upon it. I hav'n't any either. I was brought up by the parish, in the workhouse. I was found at the door of a gentleman's house, who sent me to the overseers—I was about a year old then. They call me a foundling, but I don't care what they call me, so long as they don't call me too late for dinner. Father and mother, whoever they were, when they run away from me, didn't run away with my appetite. I wonder how long master means to play with his knife and fork. As for Mr. Brookes, what he eats wouldn't physic a snipe. What's your other name, Japhet?"

"Newland."

"Newland—now you shall have mine in exchange: Timothy Oldmixon at your service. They christened me after the workhouse pump, which had 'Timothy Oldmixon fecit' on it; and the overseers thought it as good a name to give me as any other; so I was christened after the pump-maker with some of the pump water. As soon as I was big enough, they employed me to pump all the water for the use of the workhouse. I worked at my *pons*, as I called the pump, all day long. Few sons worked their father more, or disliked him so much; and now, Japhet, you see, from habit, I'm pumping you."

"You'll soon pump dry, then, for I've very little to tell you," replied I; "but, tell me, what sort of a person is our master?"

"He's just what you see him, never alters, hardly

ever out of humour, and when he is, he is just as odd as ever. He very often threatens me, but I have never had a blow yet, although Mr. Brookes has complained once or twice."

"But surely Mr. Brookes is not cross?"

"No, he is a very good gentleman; but sometimes I carry on my rigs a little too far, I must say that. For, as Mr. Brookes says, people may die for want of the medicines, because I put down my basket to play. It's very true; but I can't give up 'peg in the ring' on that account. But then I only get a box of the ear from Mr. Brookes, and that goes for nothing. Mr. Cophagus shakes his stick, and says, 'Bad boy—big stick—*um*—wont forget—next time—and so on,'" continued Timothy, laughing; "and it is *so on*, to the end of the chapter."

"By this time Mr. Cophagus and his assistant had finished their dinner, and came into the shop. The former looked at me, put his stick to his nose, "Little boys—always hungry—um—like good dinner—roast beef—Yorkshire pudding—and so on," and he pointed with the stick to the back parlour. Timothy and I understood him very well this time: we went into the parlour, when the housekeeper sat down with us and helped us. She was a terribly cross, little, old woman, but as honest as she was cross, which is all that I shall say in her favour. Timothy was no favourite, because he had such a good appetite; and it appeared that I was not very likely to stand well in her good opinion, for I also ate a great deal, and every extra mouthful I took I sank in her estimation, till I was nearly at the zero, where Timothy had long been for the same offence; but Mr. Cophagus would not allow her to stint him, saying, "Little boys must eat—or won't grow—and so on."

I soon found out that we were not only well fed, but in every other point well treated, and I was very comfortable and happy. Mr. Brookes instructed me in the art of labeling and tying up, and in a very short time I was very expert; and, as Timothy predicted, the rudiments were once more handed over to him. Mr. Cophagus supplied me with good clothes, but never gave me any pocket money, and Timothy and I often lamented that we had not even a halfpenny to spend.

Before I had been many months in the shop, Mr. Brookes was able to leave when any exigence required his immediate attendance. I made up the pills, but he weighed out the quantities in the prescriptions; if, therefore, any one came in for medicines, I desired them to wait the return of Mr. Brookes, who would be in very soon. One day, when Mr. Brookes was out, and I was sitting behind the counter, Timothy sitting on it, and swinging his legs to and fro, both lamenting that we had no pocket money, Timothy said, "Japhet, I've been puzzling my brains how we can get some money, and I've hit it at last; let you and I turn doctors; we won't send all the people away who come when Mr. Brookes is out, but we'll physic them ourselves."

I jumped at the idea, and he had hardly proposed it, when an old woman came in, and addressing Timothy, said, "That she wanted something for her poor grandchild's sore throat."

"I don't mix up the medicines, ma'am," replied Timothy; "you must apply to that gentleman, Mr. Newland, who is behind the counter—he understands what is good for every body's complaints."

"Bless his handsome face—and so young too! Why, be you a doctor, sir?"

"I should hope so," replied I; "what is it you require—a lotion, or an embrocation?"

"I don't understand those hard words, but I want some doctor's stuff."

"Very well, my good woman; I know what is proper," replied I, assuming an important air. "Here, Timothy, wash out this vial very clean."

"Yes, sir," replied Timothy, very respectfully.

I took one of the measures, and putting in a little green, a little blue, and a little white liquid from the medicine bottles generally used by Mr. Brookes, filled it up with water, poured the mixture into the vial, corked, and labeled it, *haustus statim sumendus*, and handed it over the counter to the old woman.

"Is the poor child to take it, or is it to rub outside?" enquired the old woman.

"The directions are on the label;—but you don't read Latin?"

"Deary me, no! Latin! and do you understand Latin? what a nice clever boy!"

"I should not be a good doctor if I did not," replied I. On second thoughts I considered it advisable and safer that the application should be external, so I translated the label to her—"*Haustus*, rub it in—*statim*, on the throat—*sumendus*, with the palm of the hand."

"Deary me! and does it mean all that? How much have I to pay, sir?"

"Embrocation is a very dear medicine, my good woman; it ought to be eighteen pence, but, as you are a poor woman, I shall only charge you nine-pence."

"I'm sure I thank you kindly, sir," replied the old woman, putting down the money, and wishing me a good morning, as she left the shop.

"Bravo!" cried Timothy, rubbing his hands; "it's halves, Japhet, is it not?"

"Yes," replied I; "but first we must be honest, and not cheat Mr. Cophagus; the vial is sold, you know, for one penny, and I suppose the stuff I have taken is not worth a penny more. Now, if we put aside two-pence for Mr. Cophagus, we don't cheat him, or steal his property; the other seven-pence is of course ours—being the *profits of the profession*."

"But how shall we account for receiving the two-pence?" said Timothy.

"Selling two vials instead of one; they are never reckoned, you know."

"That will do capitally," cried Timothy; "and now for halves." But this could not be managed until Timothy had run out and changed the sixpence; we then each had our three-pence halfpenny, and for once in our lives could say that we had money in our pockets.

The success of our first attempt encouraged us to proceed; but afraid that I might do some mischief, I asked of Mr. Brookes the nature and qualities of the various medicines, as he was mixing the prescriptions, that I might avoid taking any of those which were poisonous. Mr. Brookes, pleased with my continual enquiries, gave me all the information I could desire, and thus I gained not only a great deal of information, but also a great deal of credit with Mr. Cophagus, to whom Mr. Brookes had made known my diligence and thirst for knowledge.

"Good—very good," said Mr. Cophagus; "fine boy—learns his business—M. D. one of these days—ride in his coach—um, and so on." Nevertheless, at my second attempt, I made an awkward mistake, which very nearly led to detection. An Irish labourer, more than half tipsy, came in one evening, and asked whether we had such a thing as was called "*A poor man's plaster*. By the powers, it will be a poor man's plaster, when it belongs to me; but they tell me that it's a sure and sartain cure for the thumbago, as they call it, which I've at the small of my back, and which is a hinder to my mounting up the ladder; so as it's Saturday night, and I've just got the money, I'll buy the plaster first, and then try what a little whiskey inside will do; the devil's in it if it won't be driven out of me between the two."

We had not that plaster in the shop, but we had blister plaster, and Timothy handing one to me, I proffered it to him. "And what may you be after asking for this same?" enquired he.

The blister plasters were sold at a shilling each, when

spread on paper, so I asked him eighteen-pence, that we might pocket the extra sixpence.

"By the powers, one would think that you had made a mistake, and handed me the rich man's plaster instead of the poor one. It's less whiskey I'll have to drink, any how; but here's the money, and the top of the morning to ye, seeing as how it's jist coming on night."

Timothy and I laughed as we divided the sixpence. It appeared that after taking his allowance of whiskey, the poor fellow fixed the plaster on his back when he went to bed, and the next morning found himself in a condition not to be envied. It was a week before we saw him again, and, much to the horror of Timothy and myself, he walked into the shop when Mr. Brookes was employed behind the counter. Timothy perceived him before he saw us, and pulling me behind the large mortar, we contrived to make our escape into the back parlour, the door of which we held ajar to hear what would take place.

"Murder and turf!" cried the man, "but that was the devil's own plaster that you gave me here for my back, and it left me as raw as a turnip, taking every bit of my skin off me entirely, forbye my lying in bed for a whole week, and losing my day's work."

"I really do not recollect supplying you with a plaster, my good man," replied Mr. Brookes.

"Then, by the piper that played before Moses, if you don't recollect it, I've an idea that I shall never forget it. Sure enough, it cured me, but wasn't I quite kilt before I was cured?"

"It must have been some other shop," observed Mr. Brookes. "You have made a mistake."

"Devil a bit of a mistake, except in selling me the plaster. Didn't I get it of a lad in this same shop?"

"Nobody sells things out of this shop without my knowledge."

The Irishman was puzzled—he looked round the shop. "Well, then, if this an't the shop, it was own sister to it."

"Timothy," called Mr. Brookes.

"And sure enough there was a Timothy in the other shop, for I heard the boy call the other by name; however, it's no matter, if it took off the skin, it also took away the thumbago, so the morning to you, Mr. Pottykarry."

When the Irishman departed, we made our appearance. "Japhet, did you sell a plaster to an Irishman?"

"Yes—don't you recollect, last Saturday? and I gave you the shilling."

"Very true; but what did he ask for?"

"He asked for a plaster, but he was very tipsy. I showed him a blister, and he took it;" and then I looked at Timothy and laughed.

"You must not play such tricks," said Mr. Brookes. "I see what you have been about—it was a joke to you, but not to him."

Mr. Brookes, who imagined we had sold it to the Irishman out of fun, then gave us a very severe lecture, and threatened to acquaint Mr. Cophagus if ever we played such tricks again. Thus the affair blew over, and it made me very careful; and, as every day I knew more about medicines, I was soon able to mix them, so as to be of service to those who applied, and before eighteen months had expired, I was trusted in mixing up all the prescriptions. At the end of that period Mr. Brookes left us, and I took the whole of his department upon myself, giving great satisfaction to Mr. Cophagus.

And now, that I have announced my promotion, it will perhaps be as well that I give the reader some idea of my personal appearance, upon which I have hitherto been silent. I was thin, between fifteen and sixteen years old, very tall for my age, and of my figure I had no reason to be ashamed; a large beaming eye, and strongly marked aquiline nose, a high forehead, fair in complexion, but with very dark hair. I was always what may be termed a remarkably clean-looking boy, from the peculiarity of my skin and complexion; my teeth were small, but were transparent, and I had a very deep dimple in my chin. Like all embryo apothecaries, I carried in my appearance, if not the look of wisdom, most certainly that of self-sufficiency, which does equally well with the world in general. My forehead was smooth, and very white, and my dark locks were combed back systematically, and with a regularity that said, as plainly as hair could do, "The owner of this does every thing by prescription, measurement, and rule." With my long fingers I folded up the little packets, with an air as thoughtful and imposing as that of a minister who has just presented a protocol as interminable as unintelligible; and the look of solemn sagacity with which I poured out the contents of one vial into the other, would have well become the king's physician, when he watched the "lord's anointed" in *articulo mortis*.

As I followed up my saturnine avocations, I generally had an open book on the counter beside me; not a marble-covered, dirty volume, from the Minerva press, or a half-bound, half-guinea's worth of Colburn's fashionable trash; but a good, honest, heavy-looking, wisdom-implying book, horribly stuffed with epithet of drug; a book in which Latin words were redundant, and here and there were to be observed the crabbed characters of Greek. Altogether, with my book and my look, I cut such a truly medical appearance, that even the most guarded would not have hesitated to allow me the sole conduct of a whitlow, from inflammation to suppuration, and from suppuration to cure, or have refused to have confided to me the entire suppression of a gumboil. Such were my personal qualifications at the time that I was raised to the important office of dispenser of, I may say, life and death.

It will not surprise the reader when I tell him that I was much noticed by those who came to consult, or talk with Mr. Cophagus. "A very fine looking lad that, Mr. Cophagus," an acquaintance would say. "Where did you get him—who is his father?"

"Father!" Mr. Cophagus would reply, when they had gained the back parlour, but I could overhear him, "father, um—can't tell—love concealment—child born—foundling hospital—put out—and so on."

This was constantly occurring, and the constant occurrence made me often reflect upon my condition, which otherwise I might, from the happy and even tenor of my life, have forgotten. When I retired to my bed I would revolve in my mind all that I had gained from the governors of the hospital relative to myself. The paper found in the basket had been given to me. I was born in wedlock—at least, so said that paper. The sum left with me also proved that my parents could not, at my birth, have been paupers. The very peculiar circumstances attending my case, only made me more anxious to know my parentage. I was now old enough to be aware of the value of birth, and I was also just entering the age of romance, and many were the strange and absurd reveries in which I indulged. At one time, I would cherish the idea that I was of noble, if not princely birth, and frame reasons for concealment. At others—but it is useless to repeat the absurdities and castle buildings which were generated in my brain from mystery. My airy fabrics would at last disappear, and leave me in all the misery of doubt and abandoned hope. Mr. Cophagus, when the question was sometimes put to him, would say, "Good boy—very good boy—don't want a father." But he was wrong, I did want a father; and every day the want became more pressing, and I found myself continually repeating the question, "*Who is my father?*"

The departure of Mr. Brookes of course rendered me more able to follow up with Timothy my little profes-

sional attempts to procure pocket money; but independent of these pillagings by the aid of pills, and making drafts upon our master's legitimate profits, by the assistance of draughts from his shop, accident shortly enabled me to raise the ways and means in a more rapid manner. But of this directly. In the mean time I was fast gaining knowledge; every evening I read surgical and medical books, put into my hands by Mr. Cophagus, who explained whenever I applied to him, and I soon obtained a very fair smattering of my profession. He also taught me how to bleed, by making me, in the first instance, puncture very scientifically all the larger veins of a cabbage-leaf, until well satisfied with the delicacy of my hand, and the precision of my eye, be wound up my instructions by permitting me to breathe a vein in his own arm.

"Well," said Timothy, when he first saw me practising, "I have often heard it said, that there's no getting blood out of a turnip; but it seems there is more chance in a cabbage. I tell you what, Japhet, you may try your hand upon me as much as you please, for two-pence a go."

I consented to this arrangement, and by dint of practising on Timothy over and over again, I became quite perfect. I should here observe, that my anxiety relative to my birth increased every day, and in one of the books lent me by Mr. Cophagus, there was a dissertation upon the human frame, sympathies, antipathies, and also on those features and peculiarities most likely to descend from one generation to another. It was there asserted, that the *nose* was the facial feature most likely to be transmitted from father to son. As I before have mentioned, my nose was peculiarly aquiline; and after I had read this book, it was surprising with what eagerness I examined the faces of those whom I met; and if I saw a nose upon a man's face, at all resembling my own, I immediately would wonder and surmise whether that person could be my father. The constant dwelling upon the subject at last created a species of monomania, and a hundred times a day I would mutter to myself, "*Who is my father?*" indeed, the very bells, when they rung a peal, seemed, as in the case of Whittington, to chime the question, and at last I talked so much on the subject to Timothy, who was my *Fidus Achates*, and bosom friend, that I really believe, partial as he was to me, he wished my father at the devil.

Our shop was well appointed with all that glare and glitter with which we decorate the "*house of call*" of disease and death. Being situated in such a thoroughfare, passengers would stop to look in, and ragged-vested, and in other garments still more ragged, little boys would stand to stare at the variety of colours, and the 'pottecary gentleman, your humble servant, who presided over so many labeled-in-gold phalanxes which decorated the sides of the shop. Among those who always stopped and gazed as she passed by, which was generally three or four times a day, was a well-dressed female, about forty years of age, straight as an arrow, with an elasticity of step, and a decision in her manner of walking which was almost masculine, although her form, notwithstanding that it was tall and thin, was extremely feminine and graceful. Sometimes she would fix her eyes upon me, and there was a wildness in her looks, which certainly gave a painful impression, and at the same time so fascinated me, that when I met her gaze, the paper which contained the powder remained unfolded, and the arm which was pouring out the liquid suspended. She was often remarked by Timothy, as well as me; and we further remarked, that her step was not equal throughout the day. In her latter peregrinations, towards the evening, her gait was more vigorous, but unequal, at the same time that her gaze was more steadfast. She usually passed the shop for the last time each day, about five o'clock in the afternoon. One evening, after we had watched her past as we supposed, to return no more till the ensuing morning—for this peeping in, on her part, had become an expected occurrence, and afforded much amusement to Timothy, who designated her as the "mad woman,"—to our great surprise, and to the alarm of Timothy, who sprung over the counter, and took a position by my side, she walked into the shop. Her eye appeared wild, as usual, but I could not make out that it was insanity; I rather ascribed it to religious fanaticism. I recovered my self-possession, and desired Timothy to hand the lady a chair, begging to know in what way I could be useful. Timothy walked round by the end of the counter, pushed a chair near to her, and then made a hasty retreat to his former position. She declined the chair with a motion of her hand, in which there was much dignity, as well as grace, and placing upon the counter her hands, which were small and beautifully white, she bent forward towards me, and said, in a sweet, low voice, which actually startled me by its depth of melody, "I am very ill."

My astonishment increased every moment. Why, I know not, because the exceptions are certainly as many as the general rule, we always form an estimate of the voice before we hear it, from the outward appearance of the speaker; and when I looked up in her face, which was now exposed to the glare of the argand lamp, and witnessed the cadaverous, pale, chalky expression on it, and the crow feet near the eyes, and wrinkles on her forehead, I should have sooner expected to have heard a burst of heavenly symphony from a thunder-cloud, than such music as issued from her parted lips.

"Good heavens, madam!" said I, eagerly and respectfully, "allow me to send for Mr. Cophagus."

"By no means," replied she. "I come to you. I am aware," continued she, in an under tone, "that you dispense medicines, give advice, and receive money yourself."

I felt very much agitated, and the blush of detection mounted up to my forehead. Timothy, who heard what she said, showed his uneasiness in a variety of grotesque ways. He drew up his legs alternately, as if he were dancing on hot plates; he slapped his pockets, grinned, clenched his fists, ground his teeth, and bit his lips till he made the blood come. At last he sidled up to me, "She has been peeping and screwing those eyes of hers into this shop for something. It's all up with both of us, unless you can buy her off."

"I have, madam," said I at last, "ventured to prescribe in some trivial cases, and, as you say, receive money when my master is not here; but I am entrusted with the till."

"I know—I know—you need not fear me. You are too modest. What I would request is, that you would prescribe for me, as I have no great opinion of your master's talents."

"If you wish it, madam," said I, bowing respectfully.

"You have camphor julep ready made up, have you not?"

"Yes, madam," replied I.

"Then do me the favour to send the boy with a bottle to my house directly." I handed down the bottle, she paid for it, and putting it into Timothy's hands, desired him to take it to the direction which she gave him. Timothy put on his hat, cocked his eye at me, and left us alone.

"What is your name?" said she, in the same melodious voice.

"Japhet Newland, madam," replied I.

"Japhet—it is a good, a scriptural name," said the lady, musing in half soliloquy, "Newland—that sounds of mammon."

"This mystery is unraveled," thought I, and I was right in my conjectures. "She is some fanatical metho-

dist;" but I looked at her again, and her dress disclaimed the idea, for in it there was much taste displayed.

"Who gave you that name?" said she, after a pause.

The question was simple enough, but it stirred up a host of annoying recollections; but not wishing to make a confidant of her, I gently replied, as I used to do in the Foundling Hospital on Sunday morning—"My godfathers and godmothers in my baptism, ma'am."

"My dear sir, I am very ill," said she, after a pause, "will you feel my pulse?"

I touched a wrist, and looked at a hand that was worthy of being admired. What a pity, thought I, that she should be old, ugly, and half crazy!

"Do you not think that this pulse of mine exhibits considerable nervous excitement? I reckoned it this morning, it was at a hundred and twenty."

"It certainly beats quick," replied I, "but, perhaps, the camphor julep may prove beneficial."

"I thank you for your advice, Mr. Newland," said she, laying down a guinea, "and if I am not better, I will call again, or send for you. Good night."

She walked out of the shop, leaving me in no small astonishment. What could she mean? I was lost in reverie, when Timothy returned. The guinea remained on the counter.

"I met her going home," said he. "Bless me—a guinea—why, Japhet!" I recounted all that had passed. "Well, then, it has turned out well for us, instead of ill as I expected."

The *us* reminded me that we shared profits on these occasions, and I offered Timothy his half; but Tim, with all his *espièglerie*, was not selfish, and he stoutly refused to take his share. He dubbed me an M. D., and said I had beat Mr. Cophagus already, for he had never taken a physician's fee.

"I cannot understand it, Timothy," said I, after a few minutes' thought.

"I can," replied Timothy. "She has looked in at the window until she has fallen in love with your handsome face; that's it, depend upon it." As I could find no other cause, and Tim's opinion was backed by my own vanity, I imagined that such must be the case. "Yes, 'tis so," continued Timothy, "as the saying is, there's money bid for you."

"I wish that it had not been by so ill-favoured a person, at all events, Tim," replied I; "I cannot return her affection."

"Never mind that, so long as you don't return the money."

The next evening she made her appearance, bought as before a bottle of camphor julep—sent Timothy home with it, and asking my advice, paid me another guinea.

"Really, madam," said I, putting it back towards her, "I am not entitled to it."

"Yes, you are," replied she. "I know you have no friends, and I also know that you deserve them. You must purchase books, you must study, or you never will be a great man." She then sat down, entered into conversation, and I was struck with the fire and vigour of the remarks which were uttered in such a melodious tone.

Her visits, during a month, were constant, and every time did she press upon me a fee. Although not in love with her person, I certainly felt very grateful, and, moreover, was charmed with the superiority of her mind. We were now on the most friendly and confiding terms. One evening, she said to me, "Japhet, we have now been friends some time. Can I trust you?"

"With your life, if it were necessary," replied I.

"I believe it," said she. "Then can you leave the shop and come to me to-morrow evening?"

"Yes, if you will send your maid for me, saying that you are not well."

"I will, at eight o'clock. Farewell, then, till to-morrow."

The next evening I left Timothy in charge, and repaired to her house; it was very respectable in outward appearance, as well as its furniture. I was not, however, shown up into the first floor, but into the room below.

"Miss Judd will come directly, sir," said a tall, meagre, puritanical looking maid, shutting the door upon me. In a few minutes, during which my pulse beat quick, for I could not but expect some disclosure; whether it was to be one of love or murder, I hardly knew which. Miss Aramathea Judd, for such was her Christian name, made her appearance, and sitting down on the sofa, requested me to take a seat by her.

"Mr. Newland," said she, "I wish to—and I think I can—entrust you with a secret most important to me. Why I am obliged to do it, you will perfectly comprehend when you have heard my story. Tell me, are you attached to me?"

This was a home question to a forward lad of sixteen. I took her by the hand, and when I looked down on it, I felt as if I was. I looked up into her face, and felt that I was not. And as I now was close to her, I perceived that she must have some aromatic drug in her mouth, as it smelt strongly—this gave me the supposition that the breath, which drew such melodious tones, was not equally sweet, and I felt a certain increased degree of disgust.

"I am very grateful, Miss Judd," replied I; "I hope I shall prove that I am attached when you confide in me."

"Swear, then, by all that's sacred, you will not reveal what I do confide."

"By all that's sacred I will not," replied I, kissing her hand with more fervour than I expected from myself.

"Do me then the favour to excuse me one minute." She left the room, and in a very short time, there returned, in the same dress, in every other point the same person, but with a young and lively face of not more, apparently, than twenty-two or twenty-three years old. I started as if I had seen an apparition. "Yes," said she, smiling, "you now see Aramathea Judd without disguise; and you are the first who has seen that face for more than two years. Before I proceed further, again I say, may I trust you—swear!"

"I do swear," replied I, and took her hand for the book, which this time I kissed with pleasure, over and over again. Like a young jackass as I was, I still retained her hand, throwing as much persuasion as I possibly could in my eyes. In fact, I did enough to have softened the hearts of three bonnet-makers. I began to feel most dreadfully in love, and thought of marriage, and making my fortune, and I don't know what; but all this was put an end to by one simple short sentence, delivered in a very decided but soft voice, "Japhet, don't be silly."

I was crushed, and all my hopes crushed with me. I dropped her hand, and sat like a fool.

"And now hear me. I am, as you must have already found out, an impostor; that is, I am what is called a religious adventuress—a new term, I grant, and perhaps only applicable to a very few. My aunt was considered, by a certain sect, to be a great prophetess, and had the gift of the unknown tongues, which I hardly need tell you, is all nonsense; nevertheless, there are hundreds who believed in her, and do so now. Brought up with my aunt, I soon found out what fools and dupes may be made of mankind by taking advantage of their credulity. She had her religious inspirations, her trances, and her convulsions, and I was always behind the scenes: she confided in me, and I may say that I was her only confidant. You cannot, therefor, wonder at my practising that deceit to which I have been brought up from almost my infancy. In person I am the exact counterpart of what my aunt was at my age, equally so in figure, although my figure is now disguised to resemble that of a woman of her age." I looked when she said this, and perceived that by carrying the bones of her stays up very

high, she had contrived to give an appearance of flatness to a breast, which seemed to swell with indignation at such treatment. "I often had dressed myself in my aunt's clothes, put on her cap and front, and then the resemblance was very striking. My aunt fell sick and died; but she promised the disciples that she would reappear to them, and they believed her. I did not. She was buried, and by many her return was anxiously expected. It occurred to me about a week afterwards that I might contrive to deceive them. I dressed in my aunt's clothes, I painted and disguised my face as you have seen, and the deception was complete, even to myself, as I surveyed myself in the glass. I boldly set off in the evening to the tabernacle, which I knew they still frequented—came into the midst of them, speaking in the unknown tongue, and they fell down and worshipped me as a prophetess risen from the dead; deceived, indeed, by my appearance, but still more deceived by their own credulity. For two years I have been omnipotent with them; but there is one difficulty which shakes the faith of the new converts, and new converts I must have, Japhet, as the old ones die, or I should not be able to fee my physician. It is this; by habit I can almost throw myself into a stupor or a convulsion, but to do that effectually, to be able to carry on the deception for so long a time, and to undergo the severe fatigue attending such violent exertion, it is necessary that I have recourse to stimulants—do you understand?"

"I do," replied I; "I have more than once thought you under the influence of them towards the evening. I'm afraid that you take more than is good for your health."

"Not more than I require for what I have to undergo to keep up the faith of my disciples; but there are many who waver, some who doubt, and I find that my movements are watched. I cannot trust the woman in this house. I think she is a spy set upon me, but I cannot remove her, as this house, and all which it contains, are not mine, but belong to the disciples in general. There is another woman, not far off, who is my rival; she calls me an impostor, and says that hers is the true unknown tongue, and mine is not. This will be rather difficult for her to prove," continued she, with a mocking smile, "as neither are, or can be, understood. Beset as I am, I require your assistance, for you must be aware that it is rather discreditable to a prophetess, who has risen from the dead, to be seen all day at the gin-shop, yet without stimulants now I could not exist."

"And how can I assist you?"

"By sending me, as medicine, that which I dare no longer procure in any other way, and keeping the secret which I have imparted."

"I will do both with pleasure; but yet," said I, "is it not a pity, a thousand pities, that one so young—and, if you will allow me to add, so lovely, should give herself up to ardent spirits? Why," continued I, taking her small white hand, "why should you carry on the deception; why sacrifice your health, and, I may say, your happiness——" What more I might have said I know not, probably it might have been an offer of marriage, but she cut me short.

"Why does every body sacrifice their health, their happiness, their all, but for ambition and the love of power? It is true, as long as this little beauty lasts, I might be courted as a woman, but never should I be worshipped as—I may say—a god. No, no—there is something too delightful in that adoration, something too pleasant in witnessing a crowd of fools stare, and those three times my age falling down and kissing the hem of my garment. This is, indeed, adoration! the delight arising from it is so great, that all other passions are crushed by it—it absorbs all other feelings, and has closed my heart even against love, Japhet. I could not, I would not debase myself, sink so low in my own estimation, as to allow so paltry a passion to have dominion over me; and, indeed, now that I am so wedded to stimulants, even if I were no longer a prophetess, it never could."

"But is not intoxication one of the most debasing of all habits?"

"I grant you, in itself; but with me and in my situation it is different. I fall to rise again, and higher. I cannot be what I am without I stimulate—I cannot stimulate without stimulants, therefore it is but a means to a great and glorious ambition."

I had more conversation with her before I left, but nothing appeared to move her resolution, and I left her, lamenting, in the first place, that she had abjured love, because, notwithstanding the orris root, which she kept in her mouth to take away the smell of the spirits, I found myself very much taken with such beauty of person, combined with so much vigour of mind; and in the second, that one so young should carry on a system of deceit and self-destruction. When I rose to go away, she put five guineas in my hand, to enable me to purchase what she required. "Add to this one small favour," said I, "Aramathea—allow me a kiss."

"A kiss," replied she, with scorn; "no, Japhet, look upon me, for it is the last time you will behold my youth; look upon me as a sepulchre, fair without, but unsavory and rottenness within. Let me do a greater kindness, let me awaken your dormant energies, and plant that ambition in your soul, which may lead to all that is great and good—a better path, and more worthy of a man than the one which I have partly chosen, and partly destiny has decided for me. Look upon me as your friend; although, perhaps, you truly say, no friend unto myself. Farewell—remember that to-morrow you will send the medicine which I require."

I left her, and returned home: it was late. I went to bed, and having disclosed as much to Timothy as I could safely venture to do, I fell fast asleep, but her figure and her voice haunted me in my dreams. At one time she appeared before me in her painted enameled face, and then the mask fell off, and I felt at her feet to worship her extreme beauty; then her beauty would vanish, and she would appear an image of loathsomeness and deformity, and I felt suffocated with the atmosphere impregnated with the smell of liquor. I would wake and compose myself again, glad to be rid of the horrid dream; but again would she appear, with a hydra's tail, like Sin, in Milton's Paradise Lost, wind herself round me, her beautiful face gradually changing into that of a skeleton. I cried out with terror, and awoke to sleep no more, and effectually cured by my dream of the penchant which I felt towards Miss Aramathea Judd.

The next day I sent Timothy to purchase some highly rectified white brandy, which I coloured with a blue tincture, and added to it a small proportion of the essence of cinnamon, to disguise the smell; a dozen large vials, carefully tied up and sealed, were despatched to her abode. She now seldom called, unless it was early in the morning; I made repeated visits to her house to receive money, but no longer to make love. One day I requested permission to be present at their meeting, and to this she gave immediate consent; indeed we were on the most intimate terms, and when she perceived that I no longer attempted to play the fool, I was permitted to remain for hours with her in conversation. She had, as she told me she intended, re-enameled and painted her face, but knowing what beauty was concealed underneath, I no longer felt any disgust.

Timothy was very much pleased at his share of this arrangement, as he seldom brought her the medicine without pocketing half-a-crown. For two months all went on well, but Timothy had such curiosity to attend one of these meetings, that he himself asked Miss Judd's permission—it was granted; he went there with me,

witnessed the scene of folly, duplicity, and credulity, and without my having any idea of what he intended, he formed a project in his own head by which to expose it; his love of fun overcoming all motives arising from interest and prudence.

We had some difficulty to obtain permission for both of us to go out, but Mr. Cophagus consented, as we had not had a holiday for the whole period we had been in his service. He staid at home, and we went to drink tea with Miss Judd, by appointment, as we asserted. But Timothy was determined to go a second time to the meeting, that he might put his projects into execution. I again applied to Mr. Cophagus, little thinking that I was taking a step which would put an end to all the presentation guineas which I received, in return for my supplying Miss Judd with the means of deceiving her disciples.

"Out again," said Mr. Cophagus, "when—um—why—no, no."

I replied that we had free admissions presented to us for one of the minor theatres, and that we had never been to a theatre in our lives.

"Theatre—music—all for nothing—good—what's the play?"

"Mock Doctor, sir, and another."

"Mock Doctor—cut up profession—um—bad—very funny, and so on. Go." And so we went.

Timothy had not taken his basket of medicine on that day, as I thought, and he put it on his arm; but the rogue had delivered it before, still he carried his basket. The disciples were all collected when we arrived, and on our entering the drawing room, on the first floor, we found Miss Judd in her low pulpit, not a little the worse for liquor, but, nevertheless, all the better able to act her part. I took my place, as I generally did when I went there, behind the pulpit, where I perceived that a store of vials full of my medicine were deposited, in case she should require them, a circumstance which did not escape the mischief-loving Timothy. Miss Judd had just commenced her shrieks—"Ullima! Ullima! protocol parbihi chron ton—Ullima! Ullima!—there is a little light." Two old fools, with spectacles, were taking down the words which escaped from her lips on large books, already filled with her former inspirations, of which they supposed that one day they were to receive the key. Another dose from one of my bottles, which stood beside on the pulpit, and she again commenced her violent gestures and strange jargon—crying out, "There is more light—Ullima! Ullima! Yes, there sure is light—is light;" and then overcome with her violence and frantic gesticulations, she fell down, as they supposed, in a trance, in which she asserted she was permitted to view the mansions of the blessed. I received her into my arms, and laid her on the floor of the room, and now half a dozen old women, who considered that they also had been favoured with the tongues, commenced a simultaneous howl, enough to frighten away the evil spirit. At last they threw themselves down on the floor in apparent convulsions. Timothy ran to them, and pouring down their throats vial after vial, the contents of which they sucked in greedily, soon made them more outrageous, while the other disciples seated on each side of the room, on two long forms, cried out, "A visitation, a visitation! Hosannah to on high—Hosannah to the prophetess!" This blasphemy continued about half an hour, when Aramathea rose, as if recovered from her trance, but the liquor had had its effect; her gait was trembling, and she required my support to gain the pulpit. She had just obtained her position, and, holding on by both hands, was about to address the meeting, when Timothy, who had purchased about two score of sparrows, and had them concealed in his basket, opened the lid and let them all fly; they immediately flew to the lights, which they extinguished, and all was in darkness. To the howling of the drunken old women was now added the cries of alarm. Timothy jumped on the table, and with a piece of phosphorus, which he had in a small vial of water all ready, marked out on his own clothes and person, rib after rib, bone after bone, until he appeared by degrees, to their astonished eyes, to form himself into a fiery skeleton. Then came shrieks of horror and dismay; the uproar was astounding. "Beelzebul Alreddin!—Ullima! Ullima!—Avaunt Ashteroth!—Avaunt Ullima! my Ullima!—Prophetess, where are you?" Up they all rose at last, for fear had hitherto held them to their seats—up they all rose, like two coveys of birds, to escape from the evil one, who, they imagined, had entered into their tabernacle; but Timothy had walked behind the forms, and having procured about two dozen small gimblets, had silently and unperceived, fixed every man and woman by their clothes to the long forms on which they had been seated, so that when they all got up the forms adhered to and connected them all together, and the fall of one or two brought down all the rest, sprawling, kicking, and shrieking, on the floor, in their horror and dismay. It was a pandemonium—and Timothy, on the table, flaming in phosphorus looked like Satan, when he called the fallen angels from the fiery gulf. For myself, aware of what would take place, I drew the now almost insensible form of Aramathea away from the pulpit, and contrived to gain the door and carry her down stairs. Timothy, after adding one or two yells to increase the clamour and dismay, sprang from the table and followed me. Just as we had closed the parlour-door, the police burst in and ascended the stairs, and we took that opportunity to escape, carrying the insensible Aramathea between us. Notwithstanding some opposition, on the part of the crowd collected outside, we contrived to get clear of it, and at last gained the house of Mr. Cophagus.

"Ha!" cried he, opening the door, "what's all this?—young woman—run over—much hurt, and so on?"

"Not very much hurt, sir, I believe," replied I, "but very much frightened," as we carried her into the back parlour, and laid her on the sofa.

Mr. Cophagus proceeded to examine her; he felt her pulse—he opened her eyelids—he smelt her breath. "Ah!" said he, "can't prescribe—bad woman—quite drunk—gin—um—compounds, and so on." He then went to the door, called a watchman, ordered Miss Judd to be taken to the watchhouse, where she was locked up with all her disciples, who had preceded her. We dared not make any objections. The next day I was informed by report of the exposure which had taken place, and never after that heard any more of Miss Aramathea Judd.

I blamed Timothy very much for his unguarded behaviour, but he defended himself, by observing that it was his duty to unmask hypocrisy so nefarious, and that there could be no good derived from money bestowed, as it had been on us, for such a pernicious confederacy. I could not deny the truth of his observations, and when I reflected, I blushed at the sums I had received and squandered away; we continued to live in the greatest harmony, and I found favour more and more in the sight of Mr. Cophagus.

[As but one number of the Metropolitan containing the Adventures of Japhet had been received when the Museum went to press, the editor reserves the privilege of omitting it hereafter, if it should be found to contain anything improper for perusal. Such is the popularity of Captain Marryatt's tales that most readers will desire to have them, even if they are not as good as Jacob Faithful, or Peter Simple.—*Ed. Museum.*]

From the London Spectator.

LEE'S LIFE OF NAPOLEON.

Did any one ever read all that has been written about Napoleon Bonaparte? Is this task necessary even to his biographer? If not, what portion of it? Can the general reader gain an accurate idea of the early circumstances, education, training, character, and exploits of the hero of Marengo, and the author of the Code, with less pains than the writer of his life must devote to them? The difficulty of answering some of these questions—the visions of print which most of them conjure up—is sufficient to show that an able, complete, and impartial life of Napoleon, embraced in a moderate compass, would deserve, and most probably receive, encouragement. This is the object Mr. Lee proposes to accomplish; as well as to expose the errors or misrepresentations of other writers, more especially of Sir Walter Scott. In the words of his own measured style,

"The general impression, that an impartial and accurate biography of the Emperor Napoleon does not exist, and that Sir Walter Scott, in his *Life of Napoleon Bonaparte*, did injustice to his subject, authorises an endeavour to supply that defect and repair that injustice. In the body and appendix of the work, the first volume of which is now submitted to the public, this double object is attempted.

"The fame and amiableness of the author of *Waverley*, since they give importancce to his errors and effect to his detraction, are far from alleviating his faults as an historian. His name is less glorious than that of Napoleon; his memory less sacred than truth."

The first volume only of this undertaking is at present published; and it brings down the life of Napoleon to the commencement of the campaign of Italy. The biography itself, however, occupies fewer pages than one half of the volume, and in point of matter very much less than half. In the text Mr. Lee judiciously tells his own story; and throws his proofs, his disquisitions, and his controversies, into the appendix. The biography will not take high rank as a work of art. The author has not a genius equal to his theme; but, apparently deeming that lofty exploits require a lofty style, he has generally eschewed simplicity, and spoken too much in "King Cambyses' vein." His facts are better than the mode of narrating them; though his leaning to Bonaparte is obvious. In the account of the family and birth of Napoleon, his school-days, his first entrance into the army, and his various services till his appointment to command the artillery at the siege of Toulon, Mr. Lee tells little indeed that is not well known, and that little only concerns matters of detail. The discussion of his alledged distresses in Paris, the disreputable opinions in relation to his marriage, and some points regarding the campaign in Italy, are most important. The new biographical light Mr. Lee has thrown upon the career of Napoleon is, however, from March 1794 to October 1795—*i. e.* from the surrender of Toulon until his appointment to the command of the troops destined to oppose the sections of Paris. In all the other biographies we remember, this eventful period is either unmentioned or slobbered over. The hero passes, hocus-pocus fashion, from a commander of artillery to the confidential officer of the Convention and Directory in an attack affecting their existence; and then to the chief command of the army of Italy. Mr. Lee, by narrating in detail his services in that army under Dumerbion, and the reputation and influence he thence acquired with the officers and the deputies —his dissatisfaction with the ruling powers at Paris about promotion, his squabble with the minister of war, and his subsequent employment in the office of his successor in advising upon the operations of the armies—has put an end to all the *wonders* of his career—to the luck, the chances, and the tales of Barras's patronage. The life of Bonaparte now reads like a connected story, where we can trace each successive step; and where we find that the principal share which fortune had in the business of his advancement, was in casting him upon the troublous times of the Revolution, when military merit of all kinds was wanted. It was his character, his abilities, and acquirements, which first gained him consideration and employment: and they enabled him to take advantage of favourable circumstances, not only by distinguishing himself at the time, but so to act as to make each step lay the foundation of others, which should follow it. His course was to do all he could, to do it as well as he could, and to do it without regarding who might reap the credit. The chapter in which the events we have alluded to are narrated, does not well admit of detached extracts. The result of the whole is important, but no part is very striking. Here, however, is the climax—a narrative of the circumstances which led to Bonaparte's appointment to command the Conventional forces.

"In the course of the night and the next morning, the government delivered arms to the few well-affected citizens of all parties who volunteered their services, and placing them under the command of General Berruyer, attached them to General Menou's regular force. During the same time, the section Lepelletier, in conjunction with seven others, declared itself to be in a state of rebellion, and took instant measures for rousing the whole city to arms. Its leaders despatched emissaries, and sounded the tocsin throughout Paris; and the people, inflamed and deluded, seized their arms, and hastened to the places of rendezvous.

"The Convention, upon this, decreed their session to be permanent, and charged their appropriate committees with the maintenance of public order. The executive committee, composed of the committees of public safety and general security, then proceeded to direct that the section Lepelletier should be instantly disarmed by military force. About eight o'clock in the evening of the 3d, General Menou, who commanded the army of the interior, accompanied by the three representatives of the people who were in attendance as commissaries of the Convention, proceeded, at the head of a strong force, with a detachment of cavalry and two pieces of cannon, to carry this order into execution. The force of the section was drawn up in the court of the convent *des Filles St. Thomas*, at the head of the street Vivienne, where the exchange is now situated. Their parties occupied the windows of the street, and the interior of the convent. Menou entering this street from that of St. Honoré, marched towards them, and got his troops wedged into this long and narrow space, where neither his horse nor his infantry could act to advantage. Afraid to advance, and ashamed to retire, the general and the deputies resorted to words. They summoned the insurgents to

obey the order of the government, to deliver up their arms, and retire to their homes. But they gained as little by parley as by force; for Delalot, the leader of the rebels, not only refused obedience to the summons, but delivered an inflammatory harangue to the troops, in which he boldly declared, that force alone should deprive the citizens of Paris of their arms. Instead of ordering a charge, Menou and his council of deputies were glad to enter into a compromise, by which the insurgents agreed to disperse themselves, if Menou would first withdraw his troops. This capitulation enabled the regular troops to retreat, and the insurgents to maintain their ground, continue their violence, defy the government, and proclaim their triumph.

"Fortunately for the Convention, the taste of Bonaparte for dramatic entertainments had led him that evening to the theatre Feydeau, which is close by the head of the street Vivienne. Informed of the threatened conflict, he left the theatre for the purpose of observing this more important scene. He witnessed the unfortunate check of the government force, and, by a natural movement of concern and curiosity, hastened to the gallery of the Convention to see what would be done to repair it. He found that assembly in the greatest agitation; the commissaries, who had accompanied Menou, in order to shift the blame from their own shoulders, were accusing the absent general of treason. On their representation, Menou's arrest was decreed; and, of consequence, a successor was to be appointed. The danger was great; and the intelligence of every moment proved that it was increasing. Various members proposed different commanders—some Barras, some Bonaparte; the leading Thermidoriens the former, because of his activity in the defeat of Robespierre; the commissaries of the army of Italy and the members of the committee who were in daily intercourse with him, the latter, because of his military talents, and energetic, but moderate character. Attending in the gallery, he heard these suggestions, deliberated whether he should accept a service, which, from Menou's fate, was not inviting, might prove more distasteful than the war of Vendée or the mobs of Toulon, might bathe him deep in civil blood, and blight for ever his hopes of serving his country. But, reflecting, that if the insurgents succeeded in overturning the government, the proposed improvement in the constitution of the country would fail to be effected, and the royalist, or foreign party, would gain the ascendency, and surrender France to the coalition, he resolved, if he could, to defend the Convention.

"Having come to this decision, Bonaparte repaired to the executive committee, told them he had been a witness of the affair in the street Vivienne, and that the deputies were more to blame than Menou was; assuring them it would be impossible for him, should he be appointed to command the troops, to execute their orders on this critical occasion, with his hands tied by a commission of deputies. The members of the committee, struck by his confidence, were convinced by his representation; but it was not in their power, without exciting a debate, for the issue of which there was not time, to procure a decree of the Convention innovating their long established custom so completely, as to send forth a general in chief unattended by a deputation of their own body. In this exigency, they devised an expedient, which, while it conformed to their rule, obviated its inconvenience. They resolved to nominate their colleague Barras as general in chief of the army of the interior, and to appoint Bonaparte second in command; so that while Barras was to have the attendance of the deputies, Bonaparte was to take the direction of the troops."

The text is incomplete without the commentary. The following is part of Mr. Lee's note upon the subject, in which he refers to his own authorities, and discusses the truth of Scott's narrative.

"This account of the manner in which Napoleon came to be placed in command of the forces of the Convention on the 13th Vendémiaire, is derived from his own relation of that event (Montholon, t. iii. ch. 3), from the files of the *Moniteur* of that period (folio for the last six months of the year 1795), and from the procès-verbal of the Convention (t. lxx. p. 232. et t. lxxii. p. 16). The narrative of Sir Walter Scott, in reference to this subject, has evidently been constructed of very different materials. It is as follows (v. iii. p. 74). 'The general management of affairs, and the direction of the conventional forces' (says this inventive historian) 'was then committed to Barras; but the utmost anxiety prevailed among the members of the committee by whom government was administered, to find a general of nerve and decision enough to act under Barras in the actual command of the military force, in a season so delicate, and times so menacing. It was then that a few words from Barras, addressed to his colleagues Carnot and Tallien, decided the fate of Europe for well nigh twenty years. "I have the man," he said, "whom you want; a little Corsican officer, who will not stand upon ceremony." The acquaintance of Barras and Bonaparte had been, as we have already said, formed at the siege of Toulon. On the recommendation of Barras, Bonaparte was sent for.' It is needless to insist on the direct contradiction to which this fabrication is exposed by the declaration of Napoleon, that he had no acquaintance with Barras at Toulon, and that he went, of his own accord, to the committee; because there is one fact which ought to have satisfied Sir Walter that his story, whether formed by his own fancy, or furnished by some unmentionable slanderer, could not be believed by any person of common sense. It is, that Carnot and Tallien, with the knowledge of Barras, were members of the committee, with which, for many weeks, Napoleon had been in official and constant communication. It is impossible, therefore, that to men thus situated, Barras could have ejaculated the sudden discovery here ascribed to him, respecting the birth, stature, or character of Napoleon, or that, had he done so, Carnot and Tallien would have committed the safety of themselves, their families, their friends, and government, when they were under 'the utmost anxiety,' to an obscure officer, thus suddenly and queerly remembered. What renders the remark more incredible, is, that Napoleon, instead of being an obscure 'little Corsican officer,' was personally known to a number of the leading members of the Convention, as the most distinguished officer of his rank in the army."

Had all been written in the style of these extracts, there would have been no occasion for the remark already hazarded, or for much observation upon the appendix. As it is, however, it must be said, that the majority of its notes are too long, especially as some relate to small matters. What is worse than diffuseness, many of them are composed in a bad spirit—a spirit of detraction, and with a disposition to cavil; whilst the greatest violence seems reserved for doubts or details, as the fiercest tirades of the old annotators related to commas. In his zeal for Napoleon, the author sometimes tortures a joke of Scott's into a wilful libel, and appears disposed, in his zeal for his hero, to make little allowance for mistakes or misapprehensions. We state these things plainly, because they can easily be rectified in the future volumes: and these volumes we shall be glad to see—not because we think Mr. Lee will produce a complete life of Napoleon, or supersede the best

of the biographies now existing, but because we have little doubt that his keen and active research, and his ingenious spirit of partisanship, will throw some new light even on a subject apparently so exhausted.

From the London Athenæum.

AFRICAN EXPEDITION.

The expedition from the Cape of Good Hope to explore Central Africa, began its operations in June. On the 7th the wagons started from Cape Town, under the charge of a corporal of the 72d regiment, and on the 26th the heavy stores were shipped for Algoa Bay, on board the brig Test. These are expected to reach Graaf Reynet by the 15th July. The following statement has been received from the Cape. "Dr. Andrew Smith, conductor of the expedition; Capt. Edye, 98th regiment, second conductor; B. Keft conducts the leading department; John Burrow, surveyor and astronomer; George Ford, draughtsman; Charles Bell, draughtsman, and fit for any thing; C. Hartwell, assistant in general capacity; J. Minteen, servant to Dr. Smith; two missionai es sent out by the Missionary Society established at Berlin; three European soldiers, (one of the 72d, and two of the 98th regiment,) five Hottentots, of the Cape Mounted Rifle Corps; about twenty-two Hottentots, to be engaged at Graaf Reynet. Four wagons have been purchased, with ninety-six oxen; one with twenty-four oxen, belonging to Dr. Smith; and it is contemplated to buy one more, with twenty-four oxen. Fourteen of the Hottentots will be required as leaders and drivers of the oxen. Thus, the party will consist of about forty persons. The expense, exclusive of very considerable government aid in fitting out, and exclusive of wages yet to be paid to Hottentot servants, may be estimated at 1,300*l*. On the morning of the 3d of July, this expedition for exploring Central Africa, under the command of Dr. Smith, proceeded on its perilous undertaking. Dr. Smith took up his quarters at the Royal Observatory on the preceding night, and was joined the next morning at breakfast by Sir John and Lady Herschel, Baron Ludwig, Messrs. Edye, Bell, Burrow, and the gentlemen who accompany the party as far as Lattakoo. After packing up the astronomical instruments, they started in excellent spirits, making allowance for those feelings the occasion excited, where solicitude for the safe return of these enterprising men was mixed up with sincere friendship and esteem. Indeed the history of all former expeditions to the interior of Africa proves how much hazard must be incurred, even where the greatest prudence and address are exercised. The present has been planned with much care, and, considering the talents of Dr. Smith, there is a strong hope that it will be crowned with success."

A NEW FIRE-ESCAPE.

The house was on fire: Zeno, circled in flame,
In vain called for aid—sure no case e'er was sadder;
He escaped—Tell me how? Why, Antimachus came,
And lent him the use of his nose for a ladder.

From Blackwood's Magazine.

THE WATER DRINKER IN THE PYRENEES.

* * * The party for the ascent of the Pic consisted of my friend Captain C——, the two brothers of the ladies, the Italian, and three stout game-keepers or huntsmen, whom our French friend sent as guides, with an apology for his own declining to attend us, "as he had given up all hope of rising in the world." We laughed at the old gentleman's pleasantry, and set forward just as the sun was setting over the valley of the Adour, so memorable by Wellington's passage in the teeth of Soult's army. The object is to gain the highest ridge of the peak by dawn, and see the effect of sunrise on the immense surrounding landscape. We rode by the little hamlet of St. Mary's, and half a dozen others, with hard Basque names, until we reached Grip, or La Grippe, as one of our attendants called it, in compliment to the popular disease of the year. His wit amused himself and his companions, and the jest went round in the native tongue—a mixture of French and Spanish—of which one could catch but a word here and there. We were soon in the rising country, which forms the base of the mountain. It was altogether pasturage; sheep and sheep-folds were every where, and the noise of our approach roused a perpetual chorus of the huge shepherd-dogs which guard them from the wolves. Our road soon dwindled to a bridle-path, winding upwards along the course of the Adour, which was here a succession of falls. Even the bridle-path soon narrowed—we were forced to dismount, and, as all travellers had done before us, leave our horses at a little rude *chalet* or shed, where a fellow clothed in sheepskin was waiting to receive them—this being the spot from which pedestrianism begins. At this height we all seriously felt the cold; and the sharp short gusts of wind which swept through the ravines not only reminded us that we had left the snug, sunny world below, but that the world into which we had climbed, was one where to keep our footing was a delicate matter. A few hundred yards upwards we had a proof of this delicacy. About half way up the side of the mountain is one of those tarns or lakes which are so frequent in the Highlands of Scotland; a ledge of rock leads over the edge of this lake, and so fearfully over the edge, that a false step would inevitably plunge the climber into its waters,—an affair of death, for if the plump from such a height did not drown him at once, the icy chill of the lake would paralyse all exertion. At this ledge we arrived in Indian file, tired enough, with some occasional murmurs at the unexpected steepness of the ascent, and, to confess the unheroic truth, on my part, a very strong sense of the superior wisdom of being quietly in my bed. It was midnight, the moon was already touching the horizon. She loomed broad as a city on fire, in the mist of the valley; but we had no time to think of the picturesque. We must on. I had hitherto led the way; but here the Italian, probably thinking that he had a professional right to do the honours of the picturesque, hurried up to me, and finding that I was still inclined to lead, sprang along a projection of the hill, and then slipping down on the narrow

ledge, made good his advance. One of the gamekeepers, not wishing to be outdone, followed his example. Some confusion followed. At this crisis, down plunged the moon, and a sharp and powerful blast coming down the hill side at the same time, every one was forced to cling to the face of the rock. All was perfectly dark at the instant. The setting of the moon, and the storm above, turned the atmosphere into utter blackness. Suddenly there came a rushing of stones over the ledge, and a wild cry, followed by the fall of the stones into the lake. I, of course, concluded that either the Italian or the huntsman, or both, had paid the forfeit of their haste, and that all was over with them. As giving assistance to either was out of the question, and as our own fate might be the next, if we proceeded, I called a halt, and proposed that we should light torches, and having ascertained the state of our comrades, move on or return, as might be advisable. My proposal was approved of—a phosphorus box and a few bundles of thorns speedily made a blaze; and fagot in hand we proceeded in our search. It was fortunate for the Italian hero that we had adopted this measure. He had ventured about half way along the ledge, till just as he came to a corner scarcely a foot broad, a glimpse of the lake in the fearful depth below, given by the last light of the moon, turned his head. He was unable to stir another step, and the sudden darkness threw him into despair; all our party were hidden from him, and he acknowledged that his first impulse was to fling himself downward at once, and thus escape the hideous suspense of his position. For a while he had even lost all sense of hearing, and our voices, and they were loud enough on the occasion, were entirely lost upon him. The blast luckily screwed him to the rock, and he clung by instinct. Our fagots, however, gave him new life, though in the dizziness of his first emotion, he thought that the sun was rising under his feet, or that he was a witness to the last conflagration. In short, for half an hour after we had extricated him from his awkward position, the man was all but a lunatic; he raved, danced, screamed, tore his hair, and embraced every body. Our next enquiry was for the hunter. This we commenced with a general feeling of hopelessness, for the cry and the fall of stones were fearfully indicative of the unfortunate fellow's fate. Still the search must be made. More brambles were kindled, more shouts given, and one of the gamekeepers fired a fowling-piece which he had brought with him to have a shot at the wolves or eagles, as the case might be. Not a sign nor a sound was returned, and we gave him over for lost. In this state of affairs, to proceed on an excursion of mere curiosity would be heartless, and the proposal to make the best of our way homewards with our bad news was unanimously seconded. Accordingly we put ourselves in march, and had returned down a portion of the precipice, when we heard a new fall of stones, and a feeble cry from above. To come to the event at once, the hunter was seen, lying at his length on a shelf of rock, twenty or thirty feet above our heads, and unable either to ascend or descend. We roused a shepherd from one of the *chalets*, and by the help of some straw ropes made for the occasion, weighed the fellow out of his berth. He was half dead with fright. In his ambition to overpass us on the ledge, he had trodden on a loose stone; he found himself tottering, and by one of those desperate efforts which defy calculation, had actually sprung up against the perpendicular face of the rock, at least to twice his own height; there he clung by holding on to some weeds; the weeds at length gave way, bringing down with them the heap of rubbish, which had sounded to us as his knell in the bottom of the lake. By what means he now contrived to ascend, he had no recollection whatever, but he had finally ensconced himself on the projection where we discovered him, and where, "to the best of his belief, he had fallen *asleep*."

A general dram, to keep out the cold, which was now as keen as I had felt it in Newfoundland, was served round; we faced about again, and moved upward. Giving a lecture on discipline, and dividing our party into pairs, who were to assist each other, I took upon me the command, and triumphantly led the way over the formidable ledge. The wind was still our great obstacle; it came with the suddenness of a Mediterranean gale, and my only wonder now is, that some of us were not whisked away far over the valley, like gossamer. We now came into the region of snow, and found it lying thick in all the spots sheltered from the wind. Snow, in the middle of August, under the sky of the fiery south! I felt frozen to the midriff; and nothing but frequent halts, and that established resource of the mountain adventurer, the brandy flask, could have kept up our strength to reach the summit. We had lost so much time in the search at the ledge, and had found the ascent so much steeper than we expected, that we were now near losing the main object of our expedition—the view of the sunrise from the pinnacle. The darkness, which had been intense, was evidently beginning to give way—dim streaks of light were glancing through the clouds, still hanging heavy on the east, and the rugged top of the Pic was slowly shaping itself above us. But the sight was not to be lost for want of energy. With one accord we made a sudden rush up the precipice, through a small cleft running along its side; the bareness of the rock itself was more favourable to the footing than the shivery and sliding soil lower down, and finally, by mutual help, holding on of hands, and dragging up with our mountain staffs, we one and all stood upon the top. It was not the spire that we had seen from the valley, but a narrow, rugged edge of rock, splintered by many a thunder-storm. The view was immeasurably grand, but unluckily, like the view from Mont Blanc, and all other great elevations, it was too vast for detail, and too high for exactness.

All below us for a while was cloud, with the Pyrenees shooting upwards through it, like ranges of islands in some intermediate ocean. The small villages of the Basque country were little dots at our feet. The whole vast and diversified region round the base of the Pic was reduced to a plain, with a few lines of silver, the small mountain rivers, glistening through its extent.

As the dawn advanced, and the vapours thinned away, the position of Thoulouse was pointed out, and, to save the credit of my perspicuity, I imagined that I saw it, in a confused mass which lay huddled on the extreme verge of the horizon. But the sun rose at last, and all the grandeurs and glories of a southern sunrise were fairly before us. In one point we had miscalculated. His rise, instead of clearing, confused the outlines of all the distant objects. I lost sight of my vision of Thoulouse in a moment. It was buried in a mass of gold. The Adour, and its brother and sister streams, were like spiders' webs, of all colours. But the true pomp of the morning was expanded on the Pyrenee range, and, first and stateliest of the whole, the *Mont Perdu*, which, with its sides glittering in all the hues of rock and verdure, and with its summit lighting under the first rays of the sun, looked like a citadel of silver among the clouds. But though no description can equal the reality of such scenes, it must be confessed, that until balloons shall be made manageable, or man furnished with wings, the pleasantest part of those excursions is in the anticipation. By the time we reach the height, the spirit of curiosity is, in general, entirely walked, climbed, and frozen out of the adventurer. We were all tired to death, and as we sat on the brow of one of the most magnificent precipices of Europe, were thinking much less of its sublimities than of the comforts of our hotel, and the possibility of enjoying a sound sleep, *à l'abri* of all the storms, freezings, and ledges half an inch wide. We now began our descent, for the sun, after painting the skies with all possible prodigality of gem and lustre, had begun to gather the mists of the lower grounds into huge masses of vapour, which slowly ascended, bulging against the sides of the hills. Our old antagonist, the wind, too, gave now and then an ominous roar, sounding among the mountain clefts like thunder. A storm at our present exposed position would probably have hurried us "loose upon the vext winds," and blown us half-way "round the pendant globe." We hastened down with suitable expedition. The descent was sharp, yet was made without accident, and after about twenty hours of continued walking, from the time of our beginning the ascent, I was rejoiced to find myself treading on level ground again, and within the door of the hotel of Bareges.

At Bareges I remained a month. A wound which I had received in a cutting out affair in the Persian Gulf, and for which I had no satisfaction but shooting the black visaged pirate who gave it, made me desirous of trying the virtue of the baths. They are celebrated for healing old wounds. After the baths of England, or, indeed, of any other *civilised* country, the baths of the Pyrenean *aborigines* have not much to boast of; narrow, dim, dismal coffins, where wretches are boiled down into a jelly. The very sight of them requires no common fortitude, and I never lay down in one of those catacombs without feeling it necessary to draw strongly on my philosophy. But, to hear the inhabitants speak of them, the age of Romish miracles is totally eclipsed. Every disease under the moon is curable by a mere succession of tumblers, or dips in the water; and the true wonder is, that any inhabitant of Bareges should die.

They offer a release from all the ills that flesh is heir to, and unless a man is perversely fond of his heirship, the waters of Bareges would relieve him of every thing but poverty, an evil which unequivocally haunts the people of the town, though even that evil they attempt very strenuously to cure by the help of their waters, the experiment being made upon every stranger whom they can fleece. I must, however, acknowledge that I found benefit from those waters, abhorrent to the sight and smell as they are. They are sulphureous, and the fetor is enough to strangle a virgin nostril. But use does much, the odiousness of the taste, which exactly resembles a compound of bilge water and the rinsings of a foul musket, becomes, if not palatable, at least endurable, and the sense of returning health, of all senses the most charming, enables us to go through the daily martyrdom with nothing worse than a few contortions of the "human face divine."

From Bareges, a fine region for the tourist opens along the mountains. My last visit was to Gavarini, the most beautiful cascade, or succession of cascades, in the Pyrenees, or perhaps in the world. Its shape is totally unlike that of the precipitous mountain falls which flourish in the pictures of Salvator. It has neither the elevation, nor the forest, nor the romantic pilings of the rocks; still it is indescribably grand and impressive, without losing its beauty. The image that most strikes me in the hundred resemblances which every traveller finds for it, is that of a marble amphitheatre of the most colossal size, with a vast body of water poured from its highest range down into the arena, the water of course variously broken in all the successive ranges, here rushing in a powerful torrent, there shooting down in a thin silvery sheet, a little farther on winding and circling round the glistening steps, farther on still, resuming its force and pouring down in a magnificent volume of crystal. It has been conjectured by the theorists, of whom whole hosts are found hunting after specimens of geology, during the summer, that it may have been the crater of some mighty volcano. To this the objection is, that no volcanic traces are to be found in the neighbourhood. But the theorist answers, that all this happened some millions of years ago, when the earth was a comet, and the sun was a rushlight. As with a theorist, especially if he have printed his theory, argument is useless, I never attempt to shake the belief, and satisfy myself with the hope that posterity will be wiser than their fathers. At the various towns on the route, I met Spanish refugees, escaping from the feuds of their fine but unhappy country, to starve in France; they were the *factiosos*. Times are now changed, and the *apostolicos* are rambling and hungering through their old quarters. In all my conversations with these unhappy people, some of whom were elegant and graceful, and all interesting, if it were only from their fortitude, I never could discover any satisfactory reason for the feuds which drove

them into banishment. The cry was freedom, constitution, and so forth. But no Spaniard, whom I ever happened to encounter, denied that the state of society under the old government was as happy as he could fairly desire; that plenty, quiet, and amusement, were in the reach of every man; that if the monks were neither soldiers, nor statesmen, they were charitable, and kept their grounds in better order than any of the grandees; in fact, that life, on the whole, placed its enjoyments more within the power of the Spaniard than of the Frenchman, or any other inhabitant of Europe; that they knew little about what they were fighting for, and that they wished all things were as they had been. After a ramble till October, I turned my bridle to Thoulouse, and bade farewell, with more regret than I had expected, to the noble region of the Pyrenees.

From the London and Edinburgh Philosophical Magazine.

An Account of a peculiar Optical Phenomenon seen after having looked at a moving body, &c.

By R. Addams, Lecturer on Chemistry and Natural Philosophy.

During a recent tour through the Highlands of Scotland, I visited the celebrated Falls of Foyers on the border of Loch Ness, and there noticed the following phenomenon.

Having steadfastly looked for a few seconds at a particular part of the cascade, admiring the confluence and decussation of the currents forming the liquid drapery of waters, and then suddenly directed my eyes to the left, to observe the vertical face of the sombre age-worn rocks immediately contiguous to the water-fall, I saw the rocky surface as if in motion upwards, and with an apparent velocity equal to that of the descending water, which the moment before had prepared my eyes to behold this singular deception.

The cascade is through a depth of about 70 feet, and my position, as I stood when I made the observation, was nearly on a level with the centre of the fall, being the lowest of the two situations where visiters obtain a view of this copious and never-failing infusion of peat* gushing over the giant step and whitening as it flows. My attention was engaged on that part of the fall which corresponded with a horizontal plane passing through my eye and the water. The sun was masked by a cloud at the time.

I am not aware of any existing explanation of this class of optical phenomena, and I may be premature in venturing the following.

I conceive the effect to be owing to an involuntary and *unconscious* muscular movement of the eyeball, and thus occasioning a displacement of the images on the retina.

Supposing the eyes to be intently gazing at any point in a transverse plane passing through a vertically moving body, they will naturally and even irresistibly tend to follow the motion of that body; nor can the muscular apparatus of the eye maintain a stable equilibrium when the sight is fatigued and bewildered with a rapid change of moving forms before the eye.

* The colour is brown from flowing over peat moors.

Now in the case of the descending water, the eyes, being directed to a particular part in a horizontal section of it, cannot be prevented moving downwards through a small space: every new form in the moving scene invites the eyes to observe, and for that reason to follow it; but the voluntary powers are engaged to raise the axes of the eyes again to the section. This depression of the axes below the *intentional point of sight* seems to be repeated three or four times per second, whilst looking at the water-fall. Then, when the eyes are suddenly turned upon the rock, the muscles, having been brought into a kind of periodic contraction, will perform at least one of these movements after the exciting cause ceases to act; and thus the axes of the eyes, by moving downwards, will occasion a motion of the image of the rock over the retina in a direction from above downwards, and consequently the object giving that image will *appear* to move the contrary way, that is, upwards, agreeably to observation.

The deception, so far as I could judge, seemed to continue for a time equal to the interval of a periodic motion of the eye downwards when looking at the water, and, as before stated, one third or one fourth of a second.

The same kind of phenomenon may be produced by moving the eye before fixed bodies, and also when the motions are executed horizontally.

I have since been enabled to observe the appearance, with certain peculiar variations, whilst traveling parallel to one side of a narrow valley or lake, and looking across to the other. It takes place when moving in ships in sight of proximate land.

It is also producible by mechanical means, such as by a rapid unrolling of pieces of calico having some pattern or markings on them; and likewise by moving the head up and down, or laterally: but to particularise all the circumstances would make this communication inconveniently long.

From the Court Journal.

PEN-AND-INK DRAWING.

Of the novel and felicitous effect now ascertained to be producible in this style of art, we took occasion to speak, some weeks since, in noticing the successful efforts of Mr. Minasi, an Italian artist long established in this country. The same hand has since achieved a portrait (copied from a private plate) of the Duke of Devonshire, which, for truth and harmony of expression, firmness of handling, and nicety of finish, is entitled to no small share of praise. Mr. Minasi, we understand, now devotes himself especially to this peculiar mode of art, in which he executes portraits either from the life or otherwise. Those who have only seen the pen-and-ink style in its "undress"—in the loose and sketchy character it has usually exhibited—will be surprised to find, in these specimens, with how much neatness, delicacy, and brilliancy it can be invested.

From the London Literary Gazette.

The Drawing-Room Scrap-Book for 1835, *with Poetical Illustrations.* By L. E. L. London, 1835. Fisher and Co.

This volume for the present year seems to us to contain a more than usual variety of subject; and, consequently, to have afforded greater opportunities for the diversified illustrations of the genius which has brightened its pages from the first till now. L. E. L. has not of late appeared so frequently as heretofore in the field of poesy; and it is delightful to find her again pouring forth all the beauties of her inspiration. Where do we meet with song so original, so animating, so attuned to every genuine feeling of the heart. There is a perpetual freshness in the stream; and whether it leap with sparkling exultation, as if to show how life's difficulties may be overbounded; or bathe the banks, as if it wished to water their fleeting flowers with tears; or flow with placid breath towards the calm haven of rest,—still it must be a high gratification to the lovers of what is imaginative, pure, and delicious in verse, to learn that it is as inexhaustible as it is various and delightful.

Passing over a fine poetical introduction, in which Paris is vividly imaged, we shall quote two of the compositions as affording the best proof of the justice of our eulogy, and of the rich talent and touching pathos of the fair writer.

THE ORPHAN BALLAD SINGERS.

Oh, weary, weary are our feet,
And weary, weary is our way;
Through many a long and crowded street
We've wandered mournfully to-day.
My little sister she is pale;
She is too tender and too young
To bear the autumn's sullen gale,
And all day long the child has sung.

She was our mother's favourite child,
Who loved her for her eyes of blue;
And she is delicate and mild—
She cannot do what I can do.
She never met her father's eyes,
Although they were so like her own;
In some far distant sea he lies,
A father to his child unknown.

The first time that she lisp'd his name,
A little playful thing was she;
How proud we were,—yet that night came
The tale how he had sunk at sea.
My mother never raised her head—
How strange, how white, how cold she grew!
It was a broken heart, they said—
I wish our hearts were broken too.

We have no home—we have no friends;
They said our home no more was ours—
Our cottage where the ash-tree bends,
The garden we had filled with flowers;
The sounding shells our father brought,
That we might hear the sea at home;
Our bees, that in the summer wrought
The winter's golden honeycomb.

We wandered forth mid wind and rain,
No shelter from the open sky;
I only wish to see again
My mother's grave, and rest, and die.
Alas, it is a weary thing
To sing our ballads o'er and o'er—
The songs we used at home to sing—
Alas, we have a home no more!"

CALDRON SNOUT.—WESTMORLAND.

"A place of rugged rocks, adown whose sides
The mountain torrent rushes; on whose crags
The raven builds her nest, and tells her young
Of former funeral feasts."
* * * * * *

Long years have past since last I stood
Alone amid this mountain-scene;
Unlike the future which I dreamed,
How like my future it has been!
A cold gray sky o'erhung with clouds,
With showers in every passing shade;
How like the moral atmosphere
Whose gloom my horoscope has made!

I thought if yet my weary feet
Could rove my native hills again,
A world of feeling would revive—
Sweet feelings wasted, worn in vain.
My early hopes, my early joys,
I dreamed those valleys would restore;
I asked for childhood to return—
For childhood, which returns no more.

Surely the scene itself is changed!
There did not always rest, as now,
That shadow in the valley's depth,
That gloom upon the mountain-brow.
Wild flowers within the chasms dwelt,
Like treasures in some fairy hold,
And morning o'er the mountains shed
Her kindling world of vapoury gold.

Another season of the year
Is now upon the earth and me;
Another spring will light these hills—
No other spring mine own may be;
I must retune my unstrung heart,
I must awake the sleeping tomb,
I must recall the loved and lost,
Ere spring again for me could bloom.

I 've wandered, but it was in vain,
In many a far and foreign clime;
Absence is not forgetfulness,
And distance cannot vanquish time.
One face was ever in my sight,
One voice was ever on my ear;
From all earth's loveliness I turned
To wish—Ah, that the dead were here!

Oh! weary wandering to no home!
Oh! weary wandering alone!
I turned to childhood's once glad scenes,
And found life's last illusion flown.
Ah! those who left their childhood's scenes
For after-years of toil and pain,
Who but bring back the breaking heart,
Should never seek those scenes again.

There are many pieces on Indian scenery, of great power; and several poems and plates from *Pilgrim's Progress*, by C. Barton, and some charming music by Mr. Russell (the admirable bass singer), add much to the popular interest of the volume. The engravings are numerous. This Drawing-Room book is well calculated to adorn every sort of room, and to afford much pleasure to every class of the circles they contain.

NATURAL HISTORY.

Reason versus Instinct.—I have never felt convinced, nor satisfied, with the limitation to which the actions of animals are confined by the term instinct, as applied to them. True, a chicken, for example, if hatched by steam, and brought up by an "artificial mother," as Mowbray styles the flannel succedaneum for a hen, would perform its offices of incubation perfectly, and in due season, although it should never have received instructions from its mother, or by communication with any of its congeners: this is instinct. But when circumstances occur which could never have been contemplated as likely to befal it, by what name shall we designate the cause or motive which actuates its movements? A neighbour of ours, on whose word, I believe, I may safely rely, related the following anecdote to me the other day. His amateur farmyard, I should premise, is beautifully arranged, and always reminds me of that belonging to Joshua Geddes, the glorious quaker in *Red-gauntlet*. My neighbour's pigsties are railed off on two sides of the yard, where food in abundance awaits the happy *far niente* inmates; but, as it was discovered that the fowls partook too largely of that which was intended only for pigs, their wings were clipped, in order to prevent them from flying over; and the operation produced the desired result. One of the fowls, however, discovered a method by which to baffle the contrivers of its disappointment. Several pigs were loose in the yard, whose movements were watched by the bird, and, as one of them wandered near the intervening rail, it flew upon the back of the animal, and thence easily gained the tops, over which it fluttered into the enclosure, and thus obtained the desired but interdicted banquet. Was this the result of forethought, combining of circumstances, or, in short, reason? Could it be instinct?

An instance of the Robin's building its nest in a festoon of a bed, and rearing a brood of young there.—I have a friend who resides a few miles from town, and during the late fine dry weather the windows of some of the upper rooms in his house were seldom closed. A robin took advantage of this circumstance to pry into one of the apartments, one which was seldom used, and, finding no opposition here, she began to build her nest in a festoon of the bed. It happened that, during the time of setting, the gentleman's son came from school on a visit, and the bed was wanted; but this did not in the slightest degree disconcert the robin; she seemed not in the least afraid, kept possession of her nest, and successfully reared her brood. The family, of course, felt interested in the bird's fate, and therefore as little disturbance as possible was given; but one would have imagined that the mere fact of a person bringing a candle into the room, dressing and undressing, would have been sufficient to have effectually driven the creature away.

The fascination of birds by reptiles has often been heard of. A curious instance of it was witnessed by a friend of mine, an officer in the Madras army, (Lieut. Col. Ross, then captain in the 10th Native Infantry,) where the operator was not a snake, as is usual in such cases, but a crocodile, or, as we improperly call it in India, an alligator. My friend, while taking a stroll round the works at Vellore, had his attention attracted by the strange restlessness and apparent distress of a kingfisher bird (Alcèdo smyrnénsis), perched upon one of the pinnacled battlements of the fausse-braye: on his cautiously approaching near enough to ascertain the cause, he observed in the ditch immediately underneath, a crocodile lying perfectly quiet in the water, and intently watching the bird with open jaws: in the mean time the victim's agitation continued to increase; it fluttered down to a projecting point of the works, then rapidly again and again farther and farther down, till at last it actually dropped into the gaping mouth waiting ready to receive it. Although I had this account at second hand only, I have not the slightest doubt of its truth.

Toads have the power of compressing themselves so as to pass through a small aperture.—Staying some time since with an acquaintance, his servant one day brought in, from an out-house in the garden, an old tin canister which had been used for containing gunpowder, in which was composedly seated a very large toad of dimensions thrice the size of the aperture through which he must have entered. From his appearance, we concluded that he had located himself there in his younger days, and was now too large to extricate himself. The canister was placed carefully by, as an interesting exhibition to future visiters; but, on an inspection of the canister in the following morning, the prisoner had made his escape; and, as the mouth of the canister was in the same state as before, we could only account for the toad's absence on the supposition of the animal's being able to squeeze itself through. Has this fact been noticed before? It may, perhaps, help to explain some of the well-known instances of the occurrence of toads in apparently close prisons, either of trees or rocks.

"A toad in a hole," is a proverbial expression, of which literal instances are not, I believe, rare in upland pastures. One was once, in 1832, and, I believe, in July, shown to me, the circumstances of which were these:—There was a circular aperture in the turf, scarcely one inch in diameter, below which the head and eyes of a toad were observable: its body was too much in the dark to be readily seen. This, it now occurs to me, was a very pleasant cool grot for a place of residence at this season. How long had the creature been there? and upon what did it subsist? As the earth and turf would yield to pressure, the toad could scarcely have, in this instance, squeezed itself in and out occasionally. Enough, possibly, of insects to sustain it might attempt to pass over the aperture and fall in. Earwigs, I have been told, are eaten by the toad. From what I learned from the companion who showed this instance to me, it seems to be the practice of the boys to irritate the toad, which they find thus circumstanced, by applying to it the end of a stiff straight straw, and provoking the toad to grasp it in its mouth, when they lift it up, although not, so far as I understood, out of its hole.

LEVEL OF THE BALTIC.

The Commercial Gazette of St. Petersburgh, of May 28, has the following:—It has been remarked that, during the last twenty years, the water in this port has become considerably lowered, and affords a new proof of the correctness of the observations made by the ancient inhabitants of the shores of the Baltic, that the bottom of this sea is continually rising; that the level and body of the water is gradually diminishing, and that the land is increasing on every side. According to the researches of the ancient naturalists, phenomena of this nature most frequently occur in the countries near the north pole. We can quote, as an example, the lakes of Denmark, which have sunk so low, that some of them are almost entirely without water. Sweden and Norway, 2500 years ago, formed one island. The town of Pittea, in forty-five years became distant from the sea two miles, and the water receded from Loulea one mile in twenty-eight years. The ancient port of Lodisa is now four miles from the sea, and that of Westerwich two miles. At the time of the foundation of Torneo, large vessels could come close up to it—now it is in the middle of the peninsula. The islands of Errgsoe and Caroe, Apsoe and Testeroe, have been for many years joined to each other; and Louisoe, Psalmodi, Magdelone, and many more, have become part of the main land.—*New Monthly Magazine.*

THE EXPERIENCES OF RICHARD TAYLOR, ESQ., OR, LIFE IN LONDON.*

CHAP. III.—MARY ANNE'S HAIR.

Mary Anne was in her thirteenth year when we lost, by rapid, but gentle decay, her friend and instructress, Sister Agathé. Had I never heard of the immortality of the soul of man, I would have received intimation of it from the life and death of that poor nun. She could not be said to die: her soul exhaled from a frame that had already nearly thrown off every earthy and grosser particle. For the last ten days of her life, while her spirit enkindled, and burned brighter and brighter to its close, her only sustenance was a few drops of wine and water, administered by her young, weeping nurse. The devotees who crowded to her couch in the last days of her life, would fain have cried, "A miracle!" but the time was not favourable.

It was painful to me to lay the attenuated, the almost etherealised body, among the huddled festering heaps of a common London grave-yard, swelling with the mounds of past generations; but there were pious rites, decent regrets, solemn ceremonial, and what is of far more price, tears which purified the living, while they fell in oblation to the dead. My friend, Mrs. Plunkett, the orange-woman, had it of kind and country to get up a few reverential tears in honour of the dead, even when the claim was merely one of neighbourhood or slight acquaintance; and she sincerely wept "the blessed saint," though the next hour saw her, necessarily perhaps, wrangling with her customers, or calling her wares. The grief of my god-daughter was a more profound feeling. To a creature of her age, when gifted with her depth of heart, the death-bed of one beloved is a powerful preacher. Among the first intelligible sentences that she spoke to me was, "Oh! how could I so weep for my mother's chidings, and my own little crosses, when for *her* I can now do no more than weep!"

As Agathé's executor, I thought it proper to put aside, for a time, those books of Madam Guyon and other enthusiasts and mystics which she daily read with so much unction, and bequeathed to Mary Anne, as the most precious legacy. Property she had none. Her burial charges were bestowed by Christian charity, in which it is but justice to Mrs. Moir to say, that, with all her perverseness, she was not at this time backward; and yet, strange woman! she had grudged her daughter's love to the living nun, and now her tears to the departed angel.

After the death of Agathé, her pupil became for a season morbidly fond of solitude. The bustle of the family below stairs, the sharp tones of their voices, the creaking of doors and shoes, were painful and irritating to her nerves; and her only happiness was to spend whole days, shut up in the little apartment, where she found so much food for memory, and leisure for musing, and where alone she said she was happy.

I quite agreed with Mrs. Moir that too much of this "moping" would never do. I took Agathé's place as instructer,—that is to say, for fifteen minutes a day or so, we studied geography together, read a little Italian, in which I was able to be her schoolmaster, and kept alive our French, in which Mary Anne far excelled me. I also supplied her with a few suitable books; but I soon discovered, with some alarm, and also I fear amusement, that by the good offices of Mrs. Plunkett and her children, Mary Anne contrived, by aid of her father's secret half-crowns, to supply herself clandestinely with a great many, and was, at the age of fifteen, far deeper in the Mysteries of Udolpho, and the Romance of the Black Forest, than myself. There had been detections, storms, threatenings, and tears in abundance. Coming generations owe to Sir Walter Scott and some of the late novelists, the open sanction of indulgence in the contraband reading which, being made criminal in their grandmothers, was attended by some of the consequences of crime. The industrious habits of Mrs. Moir were opposed to all reading; her ignorance or moral prejudices to all novel reading, without any exception, save for an abridged Pamela. I knew not which way rightly to decide; and as free trade was prohibited, went on winking hard at the smuggling system.

The manœuvres of the girl to conceal the furtive volume were to me wickedly amusing. She sat in a window-seat *à la Turque*, her work in her lap, the subject of study conveniently placed under her legs, ready to be perused, but on the instant concealed, if the mother's step was heard approaching from the kitchen. As she was a very nimble sempstress the small quantity of work done did not lead to detection. This, with mornings, bits of the night, when a supply of candles could be got, and hours, when mamma was at market, supplied a good deal of leisure to a girl devouring tales of sentiment and wonder with the green appetite of fifteen. I repeatedly endeavoured, as a measure of safety, to obtain a relaxation of the maternal rule on this point; but Mrs. Moir appeared to become more determined from opposition. Wherever she had obtained her principles of criticism, to me they appeared singular enough. One day I saw poor Mary Anne detected in the very act of stealthily reading Werter, the fascinations of which had thrown her off her guard. The dangerous volume was taken from her with very unnecessary violence, as she had never dreamed of opposition, or of fighting to retain the harbinger of Goethe's genius; and I found that Mrs. Moir's fears were not of *love* but *suicide*.

"A disobedient little minx, idling her precious time with a book that teaches people to kill themselves!" Save for my god-daughter's tears, I could certainly have laughed; the farther history of the denounced volume had a different effect on me from that which it produced on the mother. Mary Anne denied that it had been procured in the usual way by the Irishwoman, in a manner that convinced me of her truth. Her mother insulted her by broad and rude disbelief of her statement, and my god-daughter became indignant and sullen, till violent threats against her Irish agent,—nothing less, indeed, than utter ruin in soul, body, and estate,—would have drawn the whole truth from the weeping girl, when another actor came on the scene.

This was a lodger Mrs. Moir had obtained some months before, who was passing the open parlour door, and, hearing the dispute, stepped in.

"If there be harm done, I am the guilty person, madam. It was I that lent Miss Mary Anne this book,—not my poor countrywoman at the head of the lane." Mary Anne, covered with blushes, drowned in tears, and, in an agony of youthful shame, hid her face with her hands.

"Certainly, Mr. Lyndsay Boyle, that makes a great difference. My girl getting a book in loan from a gentleman in our own family, and throwing away her pocket-money, wasting her time, and conniving with a low Irishwoman—I beg pardon, sir; improper to smuggle books into my house at any rate—makes all the odds in the world."

"Certainly, madam," said the young fellow, with a look even more sarcastic than his disdainful tone. "May I then be permitted to offer to Miss Mary Anne such volumes as my scanty collection affords that can give her any pleasure?"

"She will be greatly obliged," said the sensible mother. "Indeed I don't want—I won't take any more," said the girl, stealing a hasty look at myself, which procured me

* Continued from December, 1834, page 609. These delightful sketches are by Mrs. Johnstone, author of Clan Albin, the Nights of the Round Table, &c.—*Ed. Mus.*

the honour of a more searching than ceremonious scrutiny, from her new friend. With an attempt at complacence, he said, "I am glad to understand that you, sir, have more liberal ideas of books."

"This is more a question of the propriety of certain loans than of studies," was my somewhat pragmatical reply; for I was indeed uneasy and even alarmed, I knew not very well for what; and pleased when the gentleman, bowing very slightly, walked off, though by no means so much satisfied with the hasty, timid glance Mary Anne, now first daring to look up, sent after him and her mother, who followed him out.

"Tell me all about this, my dear Mary Anne?" I sat down with her on her window-seat. I took her hand. I allowed her in silence to weep on.

"Mr. Lyndsay Boyle heard mamma scolding me one day—and perhaps I deserve to be scolded—and scolding poor Mrs. Plunkett; and he asked Betty about it, and sent me books by her several times, which I have liked to read, and I did not like to be so rude as refuse; and indeed that is all!"

"Positively all?"

"Almost all. *Once* Mr. Lyndsay asked my father to take him to chapel with us—he is from the North of Ireland, and his mother is a presbyterian;—*once* he met me in the rain, and turned, and brought me to the head of the lane under his umbrella; and *once* he bowed to mamma and myself as we were returning from church, and he passed in a little open carriage with another gentleman."

What an accurate memory for *items!* I liked it not; though I was charmed with the candour, and even the minuteness, of the avowal; and the delicacy—for I am afraid it was rather intuitive delicacy than deliberative wisdom, which led my god-daughter to declare, that she would take no more books from Mr. Lyndsay Boyle, because it made her feel strange.

That very evening I beset my sister Anne afresh with an old scheme of having Mary Anne taken as a half-boarder in the excellent school at Bognor, at which my nieces, and several of their juvenile friends, had been educated. I had seen something of the ladies by whom the seminary was conducted. I liked their letters, for they were not very clever, nor well written; and they said nothing at all to the mothers about their "fascinating pupils," or, "the remarkable genius of the very interesting charge committed to them"—a customary phraseology of boarding-school letters, which I plead guilty to hating.

In the mean time, I undertook to supply my god-daughter with books. I had all along done so to some extent; but had never properly calculated on the diseased appetite, be it for chalk or romances, which may consume an ill-managed girl of fifteen. While the Bognor negotiation was pending, came the period when I earned from Mary Anne the name of THE GOOD GENIUS; and she has since told me, that my sudden appearances, and crossings of her secret paths, at this time, in places the most unexpected, seemed to her absolutely supernatural. Conscience is the mother of superstitions.

Levity, fickleness, affectation, the love of dress and amusement, were none of my fears for Mary Anne. Her nature—Heaven knows whence she derived it!—was too deep and passionate to make the common errors of girlhood very dangerous to her. I would rather have seen her curling her hair, and making up dresses all day,—at twenty balls, caparisoned in gauze and flowers, and perspiring in the gallopade, than as I once surprised her "under the shade of melancholy boughs," leaning—frightened at herself and every thing around her—on the arm of that confounded young Irishman, listening to music, which a set of young men had, that summer, got up for the delectation of their fair neighbours, about the Temple Gardens. Her blushes, her trembling, her apparently agonising consciousness of shame and wrong, where another girl would have felt lightly enough, made the matter worse. She drew away her arm pettishly and petulantly, then looked with anxious deprecation on her offended companion; and though she voluntarily took my arm, and begged to go home with me, I believe she struggled with her tears the whole way. Yet to go home was her own earnest proposal.

The deuce was in the girl; she was verily *bewitched*.

Upon another occasion, a few weeks afterwards, I, certainly by perfect accident, came suddenly upon my god-daughter, with one or two young companions, and this same young Irishman, and another lad, stepping into a boat for a pleasure sail, in apparently high but fluttered spirits. Female conscience was not slumbering, though Mary Anne had bid it go sleep. She started—almost screamed; and obeying my eye, like a fascinated bird, slowly came to me.

"Mary Anne, why will you leave us?" cried the girls. "Mr. Lyndsay Boyle is to show us a new beautiful steamer at Blackwall, Mr. Taylor," cried one. I did not interfere. "Indeed, indeed I cannot go—I must not go. Do not fancy me very capricious." I would rather she had gone ten times than seen that alarmed, deprecating look. The youth, the framer of the party, glowed with resentment, divided between my god-daughter and myself. Her tears partly disarmed him; but still, haughtily enough, he said, "Miss Mary Anne must act as she thinks best," and pushed off the little barque, leaving the damsel to a day of sadness, embittered by reflection on her folly, her caprice, but above all, I fear, by the dread of her new admirer's displeasure.

I was not sorry to find that he soon met flirting society, where he was not distracted by girls having qualms of conscience, scruples of delicacy, tears, caprices, unequivocal marks of tenderness, alternating with fits of pettishness, pride, and pouting disdain of attentions more lively than profound. In flirtations with the Miss Bakers, the Miss Chandlers, and others of our neighbours, the young Irishman forgot, or seemed to forget, the little spoiled whimsical girl for whom his good-nature and gallantry had been piqued when he saw her persecuted by *her* vulgar mother for the congenial sin of reading romances. The mother was the cause of a final estrangement, at which I rejoiced; for, so far as Mary Anne was interested, every fresh quarrel and pouting-fit only deepened the feelings that were hourly gaining alarming power over her. It was a long time afterwards before I was made acquainted with the circumstances of the last quarrel.

"How I long to be at Bognor, and far away from this," said my god-daughter to me one evening,—and this was often repeated: but when the journey was finally arranged, in a few weeks afterwards, she wept in secret incessantly; and honest David would have altered the whole arrangement, save for her own good sense and my firmness. A party of her young friends spent the evening previous to her departure with her. Mr. Lyndsay Boyle, on the mother's invitation, made one; and the old lady treated us with a little supper. The Irishman was a handsome, lively young fellow, with the frank, ingratiating manners of his country,—eloquent, full of frolic, and with just that slight touch of *swagger* which sits so gracefully upon the sons of the sister isle, and on them alone. He fairly eclipsed all the *John Bull beaux* of Mrs. Moir's circle; and one might have sworn that he had turned the heads of all the five girls present; save one. Even I might have been deceived, but for the slight tremour of voice with which Mary Anne tried and failed to return the *Farewell*, cordially but somewhat carelessly addressed to her by the gentleman, in expectation of her early journey in the morning.

For the next twelve months, my god-daughter lived, and I believe prospered, at Bognor. At the second holidays, she would still have declined to come home, so anxiously occupied was she, as she stated, with her studies, and so desirous had she become of profiting by this period

of leisure. But mother, and David, and god-father, and all, longed to see Mary Anne; and at the close of the next term, she came back to us for good, and, what all the women called, "vastly improved;" really, a very charming young creature. Nothing at least, could be prettier than her little hands, her pretty feet, her delicate shape, her clear and varying complexion, the ivory ears displayed by the womanly style in which she now arranged the splendid hair that formerly wont to hang curling on her neck. She had read little in this year, and yet *improved herself*. She had worked caps and lappets for her mother, and a green purse for myself; and the letters addressed to "Dear Papa," especially such as contained a request for any thing, were now penned with studied neatness.

I was apprehensive that she might feel disgusted, and become discontented or peevish in her old quarters, after enjoying the *air*, the comparative elegance, and the refinements of her school. My alarm was vain. Sweet flexibility of female nature! Mary Anne, without effort, accommodated herself to her new way of life. Her quiet and gentle demeanour even imposed restraint on her mother's violence; she was allowed to regulate her own hours and occupations, and acknowledged to be *industrious*, though still chargeable with the old fault of "moping."

I knew not whether to regret or rejoice at the total silence she maintained on the subject of Mr. Lyndsay Boyle, who had left the house a very few weeks after herself, and had, as I understood, been going to the devil in very good style ever since.

This young man had received his education at Trinity College, Dublin, and his friends had intended him for the bar; but the family finances failing, he had entered the employment of some of the many new wine and spirit companies, which in London spring up like mushrooms; and had become the confidential clerk. In this capacity, Mr. L. Boyle was probably about as foolish and extravagant as are nine tenths of his contemporaries. His salary was large, with some per centage on the sales of the house, on which last he calculated like an Irishman of twenty-three. Among his first follies, was leaving Mrs. Moir's frugal lodgings in our lane, though for this he pleaded hatred of his landlady. There must have been some natural antipathy between Mrs. Moir and Hibernians, as I never knew one of the nation who could endure her.

But if all silent, some of us had not forgotten Mr. Lyndsay Boyle. There are few persons in London who can altogether escape being hooked into a few benefit tickets. My brother James was one of those good-natured souls who once or twice a-year had a quantity of these commodities thrust upon him by the satellites of the great stars. Had they been taken from players really needing this sort of largess, one would less have minded; but, as it was, I occasionally accepted of one or two, and at this time did so, on account of my god-daughter, who, though bred in the heart of London, had not been three times in her life in any theatre. This, I have reason to believe, is the case with the daughters of many of the small tradesmen and shop-keepers, especially among the numerous dissenters; and though the theatre is a school of morals and manners, I see very little to regret in well-brought up young women missing many of its sights, and some of its lessons.

But we were this night Covent-Garden bound; and in good spirits we glanced over the English ballad opera that was to furnish our night's entertainment; and, both to keep our custom for our friends at home, a fundamental principle of British commerce, and to purchase reasonably, David came out and bought us oranges from Mrs. Plunkett, who blessed *us* both, and swore she had never seen *us* look rosier or *purtier* than that same night; and wished to the blessed saints that Mr Lyndsay Boyle could see us. We went on—one of us laughing, neither of us the merrier.

"And by the way, Mary Anne, I saw that same

'Old true love of thine'

in the Park this same day, gallantly mounted, but a whole league too far off from Blackwall, or wherever he ought to be."

There was no reply; a little shiver followed; but this was rather a cold night.

It was a well-filled, not a crowded house that we entered. We got good places, however; and amused ourselves by examining the company. There is some perverseness in human nature which does occasionally make one feel more cheerful, social, and kindly in a playhouse than in a church. Mary Anne prattled even gaily, certainly freely and carelessly; but this was not long. If he did not see *her*, she saw *him*. It was one of those exhibitions which, even to indifferent parties, do not recommend the arrangements of British theatres. The cause of the involuntary clutch of my companion at my arm, while she pressed herself against my side, as if she would have grown to me for protection from blasting images of horror and impurity, my own eyes following her glance soon explained to me; yet there was almost nothing, the indifferent would have remarked as extraordinary; for what more common than groups of gay young men and gay women in a theatre.

I was in pain for Mary Anne, though not particularly sorry that her own eyes had been her monitors; for how deep seated, how powerful, must be the feelings that, after a lapse of nearly two years, produced this terrible revulsion, this marble hue, and universal shuddering;—and time it was they were extirpated. I do not suppose that Mary Anne, spell-bound, trusted herself with another look in the direction that had tortured her. When I looked again, after the space of a few minutes, Mr. Lyndsay Boyle had left his friends, certainly without having recognised his old acquaintances.

Once or twice I offered to take her home. "No, no—Mamma would wonder;" but we ultimately came away before the afterpiece, both tired and sick, I believe, of the theatre. Several times, on her homeward walk, Mary Anne tried to speak, and failed. We were almost under the lamp at the head of our lane, when she whispered tremulously,—

"My godfather, I wish to tell you something,"—it was the very endearing, simple phrase of her childish days of unlimited confidence,—"something it would do me good to tell, and then I should be well again." She was now dreadfully agitated.

"My love, Mary Anne, you shall tell me what you please. Shall I take you home, or to Nurse Wilks first? —to my own apartment"—

"Oh, no—I cannot to night bear lights and houses. The dark—the stars—this cold free air, which keeps me from choking"——I permitted her to lead me on; and, by choice, or more likely accident, Blackfriars Bridge, at this hour solitary enough, became our confessional. Her head leaning on my shoulder, her lips close to my ear, she several times, as we stood, repeated, as if trying to commence her broken story, the words—"Once—I once imagined—I was a very young—a very foolish girl —almost a child, you remember,—who could fancy children having such dreams—to last so very long:—I imagined"———There was another suffocating pause—a kind of hysterical swelling in her throat—and passionately turning away, she exclaimed aloud—"O, I cannot tell it!" So far as regarded so penetrating an old gentleman as myself, the confidence was indeed quite superfluous. But this was no jesting matter to my poor Mary Anne, nor yet to me at that moment. I allowed her to sob herself to composure; and she took up the tale aloud which she appeared to have been pursuing in her mind

and as if I had heard the first part. "One day that I walked with *him*, thinking every moment that you would meet me, he spoke of my mother—light, scoffing, rude words. Perhaps he forgot she was my mother; but it was cruel. I felt no one could love me *right*, and speak so of my poor mother. I loved his mother:—and every soul in Ireland he ever told me of,—I loved them all! That was our last quarrel, and it is near two years. But I never told him why I was offended; for if he had loved me right, he would have known that. I waited these two years. And to-night!—to-night!" The low, quivering voice of anguish in which these words were thrilled, told me that whatever might be her fate otherwise, there was for Mary Anne slender chance of ever in this world being loved as she could love,—of being, as she childishly phrased it, "loved *right*,"—with the purity, the pride, the tenderness, the delicacy, the annihilation of self, the boundless devotion, which made up her notion, or rather her *feeling*, of the blissful condition she conceived, but could not describe.

In silence I brought her home. She ran up stairs, for a few minutes, probably to bathe her eyes, and then descended to us with that air of composure, that sweet sternness, which women borrow I know not whence.

The spring and the summer passed, and I heard no more of Mr. Lyndsay Boyle, save vague rumours of extravagance. Nor could I complain of my god-daughter. She was attentive to all her duties; helpful to her mother; cheerful and obliging with her few young companions; and, so far as I could see, contented and serene in her own mind. During this interval, she spent a good deal of her time in the family of my brother, where, twice a week, she had an opportunity of sharing in the lessons which my two elder nieces were receiving, with a view to her becoming, during the winter, the governess of their little sisters. Though David was rather dissatisfied, Mrs. Moir, Mary Anne, and myself, highly approved this arrangement. Still, my good friend, Mrs. Moir, would occasionally complain of her daughter "moping" and "drooping." She had no young confidantes; no constant correspondent; and a disinclination to spend money on herself, or, in her mother's phrase, "to make herself smart;" which, in a girl of eighteen, was at least very uncommon. Once, and but once, I ventured afar off to sound the state of her feelings. It was in the month of September of the same year in which we had been at Covent Garden. Instead of eluding, she invited the subject; but not its protracted discussion. I was even surprised by the firmness and serenity—the farthest in the world, however, from indifference—with which she said, "While he is happy I am content."

"With no desire that he should return to his allegiance?"

"None whatever. *Peace*, I have learned, is too dear a good to be periled, even for that which we call happiness."

"Then hail *la douce indifference!*" was my light response.

Mary Anne sighed, and smiled, and resumed her work. She had not reached the point I desired. She could be calmly firm, proudly content, but not coldly or serenely indifferent.

I was about this time in the habit of reading a newspaper, and spending an idle evening hour, once or twice a week, with an old blue-coat school fellow, in a little shop which his wife kept for the sale of small wares and perfumery, near the corner of ——— street.

After waiting in vain for clerical preferment, writing for newspapers and periodicals, lecturing on chemistry, trying a boarding-school in the Isle of Man, a circulating library in Liverpool, and various other occupations, G— had returned to London, and at last consented to let his wife do battle single-handed with the world, for what might maintain them, with their three children and tidy Isle of Man maid, while he seriously applied himself once more to his often laid aside, but never abandoned, translation of Lucretius; and in that absorbing task forgot, for the time, all his disappointments and sufferings. I would have rejoiced in this had he not also appeared to forget his wife's "meaner toils," and to overlook the probability of the children of a very learned man growing up without any education at all, save what comes by accident and casual association.

It was by a gracious humility that, towards six o'clock in an evening, when customers began to grow slack, G——, after a long morning of study, locked up Lucretius, assumed his wife's place, and allowed the poor woman to change, for an hour, the scene of her labours, from the back of her little counter, to the centre of her young family, and her tea dinner. On the evenings I was expected, Lucretius generally visited the crib, named the back-shop, for the benefit of my critical remarks, and the hope, nightly growing fainter, of my praise of the undertaking which might yet woo back fortune. At times I could have pitched the translated poet on the back of the few cinders which G———'s true-hearted, cheerful wife, swept together before going away, to make the compartment *comfortable* for her scholar, and his old friend.

Theirs had been a love-match, I found; though in intellectual qualities and accomplishments there could not be two persons born in the same country more opposite. She was a neat, compact little person, and I believe, a *first-hand* as a milliner, all action, and with no more thought than guided her immediate actions: He, a man of great and various learning, a speculative dreaming genius, and one of those men the worldly *justly* term indolent; though more ideas of a certain kind passed through his mind in an hour than would have occupied the worldling for a month,—I mean in number; in quality and value no comparison could be made. But while G———'s thoughts were "wandering through eternity" or lost in chaos and atoms, his large lumbering person was, at certain hours, to be found in the narrow region of space I have indicated. I am sure he sincerely loved his wife and their children; and, as he was a man of sound moral feeling, he as certainly regretted that chance or education had denied him the power of doing better for them, after his wife's little fortune had been thrown away on the boarding-school speculation,—the original project by which prudence appeared to sanction marriage. I could, however, never bring G——— to disparage the classics nor his education; nor yet to believe that Mrs. G——— merited better to be called a heroic mother and wife, than either Cornelia, or Agrippina the wife of Germanicus. At such times he would raise his great and rather dull eyes upon me, as if questioning my sanity or my seriousness; but when I proceeded, "the most truly heroic mother I ever had the happiness of knowing, is, after all, Peg Plunkett, the orange-woman, whose barrow stands at the head of our lane," he could no longer doubt that I was speaking in the boyish vein, which had formerly led me to mystify my old school-fellows. I never was more serious in my life, however,—but let that pass for the present. Besides the pleasure I took in G———'s, conversation, I felt a strong interest in the prosperity of his wife's traffic, the more, perhaps, that my former connections enabled me to open up a new and lucrative branch, as soon as, to speak it grandly, the general peace gave security to commercial speculation. The reputation of my sagacity in affairs, and the hazard of 20*l.*, embarked on my own responsibility, might have quickened my zeal for the disposal of her small fancy sculptures; those beautiful and delicate vases and figures in alabaster and composition, which I obtained from Florence, where they are so

cheaply made and bought, and which Mrs. G——— at, first, sold to very great advantage in her little shop. It was for her a prodigious stroke! and Rothschild could not have congratulated himself more on a successfully negotiated foreign loan, than I did on the small venture which set my friend's wife fairly afloat in her business; and even introduced her to a better, that is to a richer description of customers, for her other nick-nack wares, before the scupture trade deadened. This speculation did me another service with the family, it raised G——'s opinion of my judgment and capacity for affairs; the worthy translator having sometimes taken it upon him to affect surprise, that *I*, who had played my cards so ill, and with a great game before me had so abruptly thrown it up, should assume the right to lecture *him*; and over Lucretius and more favoured classics, provokingly quote the Scotish poet, Burns, against him,—

> "What makes a fire-side a happy clime
> To bairns and wife;
> That's the true pathos and sublime
> Of human life."

G—— would not allow that Burns was a poet in any sense. A more uncandid man would, in answer to me, have impeached his life; he only disparaged his verse. "Between lights," on a misty afternoon, late in October, with slimy, slippery streets, and the choking fetid air that creeps over and shrivels one's skin, and pierces and chills one's marrow, I had made my way to —— street, and sat with my friend in the cabinet boxed off from the shop, hearing him thunder out his last translated hundred and fifty verses, my eye prudently directed through a loop-hole in the green silk, which screened the four panes commanding the shut glass door, and the counter. Three times I had marked a figure glide past, and a female face momentarily gazing through the damp glass, and as quickly withdrawn. It is one of the miseries of London,—antipathy and distrust of one's fellow-creatures being to me always gnawing misery,—that the idea of a *thief* is never far distant in such circumstances. Whether the perfume of attar, and *eau de Cologne*, or the many surrounding *prettinesses*, elegances, and appliances of female refinement, had inspired gentler and more gallant notions, I cannot tell; but it was not of a thief I thought now.

The door was gently, and yet quickly opened, as if the person were in some haste or perturbation. The female advanced, a slight youthful figure; and there was a drumming summons sounded on the glass-case on the counter. I could see by the lamp-light the quick panting of the closely wrapped-up girl, and even hear her hurried unequal breathings.

"Some waiting-maid for rouge or black pins," said G——, peevishly laying down his MS., for the uncongenial office of supplying his customer. "These things, my wife tells me, are always neglected till the moment ladies are at their toilet." With a few more peevish expressions, by way of indemnifying his classic dignity, for the degradation of his secular office, G—— carefully shut the door upon me, to spare at least one of us the humiliation of coming in contact with black pins, though both knew that bread was scarce to be made by black letter, nor yet by the black art itself. The girl supported herself leaning on the glass case, her features concealed by a faded green gauze veil, which hung lank and wet about her. Could it be?—it was Mary Anne—and why this mystery?

"Your pleasure, ma'am?" said G—— formally to his silent customer. "At this hour Mrs. G—— is generally out of the shop; and I fear you will find me but an indifferent substitute. Will you be seated, ma'am—I shall do my best."

"O quite, quite well, you will do, sir—for I hope you will buy my—*my hair*." Low, rapid, and quivering as the voice was in which these few words were rather breathed than articulated, I could not be deceived in its tones. It was indeed Mary Anne. I apprehended in an instant something very near the truth. Hastily pushing the shop-door close with one hand, as if seeking concealment, with the other, the girl slipped off her bonnet and a close-eared cap, and tossing her head with an air customary to her, let down, as if tempting her chapman with the beauty of her full-displayed wares, the redundant flood of her shining tresses. Then looking up in his face with an anxious imploring agony of expression, she whispered again more earnestly, "I do hope, sir, you will buy *this* hair." She passed her right arm under it, lifting it up again, as if to show all its brightness and length, but without another word.

G—— must have been struck and embarrassed by the appearance and manner of the dealer. After some little hesitation he replied, "We do, ma'am—that is Mrs. G—— does buy hair. Yours is very beautiful, certainly: of that classic tinge, ma'am—that is, I mean, of a colour now very rare—the hue between golden and auburn, which the Roman beauties—ahem!"—This was probably intended for the back-shop,—for Dionysius's ear,—"I mean, ma'am"—— But what cared I for listening to G——'s meanings!

What a contrast did those bright, sunny tresses make with the pale, passion-struck—the almost haggard countenance of the wretched girl, whose starting eyes were straining after the reply that was impending over her like a judge's sentence on a criminal. What was the real matter? What could have happened to have sent Mary Anne abroad on such a night? But the weather was nothing—it was, why on such an errand—for what reason thus concealed—for what secret, for what *guilty* purpose could Mary Anne covet money obtained so strangely? My thoughts were in tumult and insurrection, I could only hastily resolve to watch, that I might aid or save her.

This was a purchase too important to be made by my friend without the knowledge of his wife. It was an affair of importance as a business speculation; for he knew that she had an order for female hair of this very peculiar colour, to adorn the intriguing head of a prodigiously great lady belonging to the north of Europe.

Indeed, I believe I had gossipped about this very affair in the hearing of Mary Anne. Was it the influence of the classics, or his naturally trustful and humane temper that made G—— think as little of thieves as myself, when, scholarly and courteously placing a chair, he begged the agitated girl to be seated, while he went round the corner to summon his wife? At this proposal she caught at once, and appeared to breathe more freely.

"Then you think it probable, sir?"—"I do think it very probable, if you can come to terms." G—— had not learned to disparage what he purchased—he was, indeed, a wretched shopkeeper—"but you must naturally, expect a great deal for your beautiful" —— "O, no, no, not a great deal—any thing; but I want a great deal, too—a very great deal of money, this *very* hour!"

The agitation of her manner must have been remarked even by G——, though not naturally the quickest of men. For my own part, I knew not how to act. Was her mind shaken by this unknown distress? I never had more difficulty in my life than to command myself during the few minutes that G—— was absent; and when Mary Anne abandoned herself to a burst of passion, leaned down her head on her crossed arms, while she sobbed in her agony, with those frightful choked sobs which are to me more excruciating than the most outrageous expression of female grief. Amidst her sobbing a name was unconsciously breathed which gave me the clew to one, perhaps to the leading, cause of her distress, while every circumstance connected with it remained more mysterious than before.

Is it habit, or nature, or mere mobility of temperament, that gives women that remarkable power I have so often noticed, of at once suppressing every violent external symptom of the passions by which they are strongly agitated? The mere mechanical effect of G—— or his wife touching the handle of the door, acted on her senses, and instantly restored at least the outward semblance of composure. She did not speak again; but by a little gesture signified assent to what was said, and bended her head while Mrs. G—— examined, with an approving eye, the offered merchandise.

If I have been too severe on the poets, I wish to give fair play to their uses.

"Would it not be a pity, ma'am," said the scholar. His wife shook her head. "Then Mrs. G—— you must give the young lady a handsome price for this hair—you have an order, you know, from"—— Mrs. G—— was really angry, now. So simple a man! Was it not enough, as she afterwards told me, that he could not earn a penny himself for his family, but he must spoil her trade!

"The utmost farthing she could afford was three guineas;" and with complying gestures, on the part of Mary Anne, and abundant speech from my friend's wife, the bargain was concluded; and the tradeswoman having secured her advantage, the *woman* came into play in her more natural character, which was kind and cheerful. It seemed a great relief to the poor girl that Mrs. G—— proposed doing the office of the *friseur* herself. She brought the girl within her counter, drew her little screens, and dexterously plying her scissors, to which her tongue kept a running accompaniment, added tress by tress to the golden sheaf that hung glittering over her table. What all this while were the feelings of Mary Anne? Her back was turned to me. She sat as still, and apparently as unconscious, as a sculptured figure, till the business was nearly ended.

The cutting off the hair of the novice immediately before she takes the last solemn vows, which separate her for ever from the world, is often represented as a very affecting scene. The resignation of the beautiful and graceful ornament of the youthful vestal, the bride of heaven, is imagined a great sacrifice. The hair is consecrated by the weeping friends, among whom it is divided, and treasured as the last relic of the living-dead. There was no one to mourn over Mary Anne's severed locks—not even myself. I thought of her heart, not her head,—or at least not of its spoils; and a truss of straw, a rush-cap would, at the moment, have been as important to the poor girl herself. To say she cared not for her loss was nothing. I am convinced that she never once thought of it. When the business was nearly ended, she drew from a silk bag a little seal formed of a Cairngorum pebble, on which the national thistle and a Scotish motto were cut; and a few strings of coral beads. I knew both well. One was the highly valued gift of her honest father; the other a present from my sister Anne made long since to my god-daughter. "Pray, ma'am, what might those be worth?" Mrs. G—— stopped her nimble scissors, and with a brief malediction on pawnbrokers, replied, "Somewhere from ten to twelve shillings, perhaps."

"But to sell them out at once?"

"Not much more, I fear;—they are horrid Jews, those pawnbrokers." With a low sigh the trinkets were returned to their keeping-place.

My friend's wife, though a sharp tradeswoman, had known adversity in its best uses. She began, I imagine, to feel some touch of remorse, under the conviction that she was certainly making a very good bargain in her rare purchase. From what I afterwards learned, there was the more prevailing idea, with a woman of her good heart, of a poor girl parting with the natural ornament a young female is supposed to cherish so fondly, and with her little trinkets, in some severe family strait, perhaps to supply the wants of little brothers and sisters, or a father and mother. Taxes, rates,—socks and shoes for children, now October was so far on,—rent-day!—that terrible day!—all these things I could learn had flashed through Mrs. G——'s mind, and many more household ideas, as her scissors cut the last locks; and kindness and prudence parleyed, and came to a compromise.

"Your hair is in such quantity that I think I must mend my offer, my dear"——

"I told you so, Mrs. G——," said G——. "This classic tinge, my love, so much prized by the Roman ladies, after the Roman arms"——

"Nonsense! Mr. G——," "——by as much as any pawnbroker would give for your little things, if you meant to part with them."

"Thank you, ma'am."

"And if you were to call in a few days, when I see how this turns out, perhaps we might afford a little more. I shall have no scruple to ask my price, but these great ladies are so capricious; any way, you must keep your little trinkets; and, at your age, your beautiful hair will soon grow again, thick and long." This was cheerfully and kindly said.

"You are very good," was the whispered reply. Of how many shades of meaning are those few simple words susceptible, when tones become more expressive than speech. Though the face was still averted, the voice told me that now

The tears had *left* their bed.

"I have left some nice pretty curls on the temples here, ma'am," said Mrs. G——, as Mary Anne rose, and as Mrs. G—— kindly tied on her cap. A faint smile gave place to the anxious fixed look which she had fastened on G——, as she turned towards him. He was at the till, slowly counting out the money. The smile vanished far more rapidly than it gathered, as the dole, the gift, the means to some mysterious end, was eagerly grasped.

As she curtsied, her dry lips moved in a mechanical effort to return thanks. I had already taken my hat; but rapid as were my movements, and deaf as I was to the call of G——, and the exclamations of his curious wife, the quicker steps of my god-daughter had left me considerably behind. She made several windings, wanting courage, as I believed, to enter any of the pawnbrokers' shop doors, near which she hovered. At last, as by a desperate effort, she entered one in Fenchurch street; and I presume there was little difficulty in honest David's national thistle, and my sister Anne's strings of coral, finding a destination the original proprietors could little have anticipated for their gifts. It was my object to trace Mary Anne to her destination, not to accompany her; and the rapidity of her movements as she *skimmed* on, and probably the rapt state of her mind, prevented any chance of detection. She stopped at a door in a street which I do not choose to name, but, as the wits say, not above a hundred and fifty miles from the Old Bailey. It was my purpose to arrest her at this point, but before I could advance, the hall door opened to her quick knock, and was shut again; and I read on the door-plate the familiar name of a well-known, or more properly, a notorious sharking Old Bailey attorney. I was more than ever perplexed. What could a creature like Mary Anne want with such a character?—what communion could there be between the spirit of innocence, and the presiding *genius* of the spot? That it was here the three or four pounds she had so strangely obtained were to be left, I could not doubt. There was no entrance within these doors but with a golden key; though peace, character, hope, happiness, *life*, might be bartered or forfeited to find one.

Her stay, lingering as the moments seemed to me,

could not be above five minutes. Other wretches were besieging the door; and as they passed in, Mary Anne glided out, and took the straight way homewards, at a rate of speed which put me to my best pace. At the last crossing, I accosted her, as if accidentally, crying out, "Ho, Mary Anne! whither so fast? Take me with you, or a part of my umbrella, any way." She started like a guilty thing, mumbling, "Yes, indeed, I believe it does rain." From the arm I drew within my own, I could feel that the whole frame trembled and shook as if to dissolution.

"You shiver, Mary Anne, and your hands are scorching. Are you quite well, my poor princess? And why abroad and alone in such a night? Has mamma been scolding very bad?" I tried to laugh, as I confidentially pressed the hand lying on my arm.

"Oh, no! Not my poor mother—'tis I am in fault—only I—if fault it be, which is deep, deadly misery. I would—I must tell you all—that I am the most wretched of all creatures this night." She stopped: she hung her whole weight on my arm, and sobbed without restraint. I passed my arm under her cloak and hurried her forward, to avoid the notice of the gazers on the street. Innocent, and even knightly, as I was, I was too well aware of the danger of rousing the gallantry and chivalrous feeling of John Bull towards a damsel in distress, to court unnecessary observation. I intended to take her to my own apartments before I proceeded farther in cross-examination; and we were now in the lane. Fortune was unfavourable. As we approached Mr. Moir's door, his industrious lady happened to open it. She accosted me with unwonted blandness and courtesy, thanking me for having "escorted her Mary Anne home from Brunswick Square!" More mystery! Mary Anne pressed my arm; and though I could not exactly comprehend why I should be made a party to her concealments, neither could I betray her. So I told, or what came to the self-same thing, I, by a *simper*, asquiesced in the *lie*. I give it the plain name, as I never was casuist or hair-splitter enough to perceive essential difference between the lie spoken and the lie acted. We were now in the neat, snug parlour. Mrs. Moir, instead of *scolding*, or what David called *yatterin*—the Scotish language is rich in descriptive epithets—was unusually attentive to the comforts of a daughter, who, in a bad evening, had returned from spending a day with Mrs. James Taylor and her *genteel* family in Brunswick Square. Her affability extended to me; and she insisted that, as tea was just ready, I should remain. Curiosity and a better feeling were stronger prompters. I did long to fathom the depths of this day's history.

The old lady bustled away for her tea equipage, and Mary Anne then first spoke. "You think strangely, perhaps meanly, perhaps unkindly, of me," cried the agitated girl, again clasping my arm with both her clasped hands. "Once that would have killed me:—nothing hurts me now. My cold, lumpish heart feels at times as if already dead within me. My poor mother thinks I have spent a happy day with the kind friends *you* made my friends—Ah, no! no!"—

"And where, then, dearest Mary Anne?—my own good girl—but I will not hurry you—I"—I never could, in emotion, speak to my god-daughter without drawing her to me; without, in short, caressing her as if she were still the little affectionate child that had grown up under my eye, and almost in my arms. "Ha! Mr. Richard," cried the tray-bearing mamma, with half-affected glee, "still flirting with my Mary Anne! I wish you were twenty years younger for her sake: I am sure you would carry her from all the younger *beaux*. And, bless me, my dear, how you have *mudded* your petticoat! A dozen spots at least! Fie, Mary Anne! you who are so *tidy* a walker—surely you could not have appeared in nice, sweet Mrs. James Taylor's drawing-room this morning with these spots." Mrs. Moir always commended good women and good puddings in precisely the same terms. They were *nice* or *sweet*, and to express the superlative both epithets were used. This is, indeed, a female practice; nor would tracing the analogy between ladies and custards greatly puzzle a metaphysician or philologist. I was glad of this diversion to the petticoat, for the countenance could worse have borne the keen maternal scrutiny. I pleaded guilty to the splashes, but Mrs. Moir was too civil to allow so dire an imputation to rest upon me, as splashing a fair neighbour in very dirty streets. She was, in reality, more occupied with her daughter than her guest; nor could I help regretting, that with so much genuine affection and dutifulness on both sides, there should be so entire a want of confidence and sympathy between them.

"Go put away your bonnet. And, bless me, what are you doing with that old green veil! and change your shoes, my Mary Anne! Papa would say, change your feet! Ha! ha! ha!"

The woman was crazy. I had never seen her in this rantipole humour. "And bless me again, girl, I forgot your *boa*:—now, Mary Anne, love, where is it? Have you made a *nice* bargain? Is it ermine or *fitch*? You know what I recommended. But let us see."

Mary Anne looked to me with anxiety and confusion. Was another lie required? "I thought—I forgot—it is not here, mamma."

"Left in Brunswick Square! Stupid monkey!—well, no matter; it would have been *prudent* had you done so of purpose in such weather with a new boa. And how much got you back of my two bright sovereigns? Now let us see how you can *shop* for yourself. Eighteen almost—hey, Mr. Taylor! and I trusted her this morning to buy a *boa* for herself, as I wished her to be *respectable*, going to spend a day with excellent Mrs. James, who sees so much genteel company of a morning. Now, how much change have you, my Mary Anne?—tell us all about it." The gracious matron smiled, as if generously expecting not a farthing, and as if not grudging her money for a *nice* smart *boa* of, as the shop-bills accurately describe it, "London-made fur."

I saw the poor girl was in torture. With more self-possession, she might have come off perfectly well, merely by using smiles and grimaces; but she faltered, as if bound to declare, "Indeed, mother, I have no money—not a farthing."

"Well, well, child, never expose your poverty; make yourself comfortable, and come back to make tea for your god-father and your papa."

My friend David came down stairs. While he shook my hand, I fancied that his eyes were fixed earnestly on his daughter. My merits as an escort were again recited, and David seemed relieved and satisfied on hearing from whence I had brought Mary Anne, who now left us. We chatted of this and that, waiting her return, for about twenty minutes, when the maid-servant, in answer to the mother's enquiry, reported that Miss Mary Anne had gone out.

"With her bonnet on?" cried the mother. "Out—the lassie!" gasped David; and involuntarily, as by a simultaneous movement, we went to the street door, following Mrs. Moir. It was impossible for Mary Anne to deny that the female from whom she hurriedly parted under a distant door-way, was the obnoxious and redoubtable Mrs. Peg Plunkett. Evidently in great terror, the girl hurriedly approached us, panting, in haste and alarm—"I forgot some cottons that I required ———"

"Hold your tongue, minx!" cried the mother, pushing her daughter into the house, and slamming the door after the whole party. "You will not believe me, David Moir—do you believe your own eyes—*ocular* demonstration before your own eyes, sir—of your precious daughter? *colleaguing* with that wicked, vagabond, dirty, Irish

barrow-woman, Mr. Taylor!" I admired the climax. "Will I be believed now? What want you with that vagabond woman? What wants she with you? To rob your mother's house, is it?" She shook the terrified girl by the shoulder.

"Hush, hush! for any sake, my dear madam, unless you wish to raise the neighbourhood," was my peace-cry. David looked from daughter to wife, and to the daughter back again, wringing his hands; and Mary Anne wept in silent anguish.

I shall not describe all the violence, in action and speech, of my good friend Mrs. Moir; who certainly might have some cause of displeasure, but nothing that could justify the preposterous lengths to which her anger went.

"But, madam, Mrs. Moir," I ventured at last to say, when the first tornado was pretty well spent, "where is the terrible harm, after all, of my god-daughter exchanging a few civil words with Mrs. Plunkett—a thing which I do once or oftener every day of my life, with great comfort and social refreshment to myself?"

"An old neighbour!" muttered David, pitching his voice to the proper tone of conjugal deprecation, and looking compassionately at the weeping girl.

"An old fiddlestick, Mr. Moir!"—How irreverent, and even impudent, these married women do become!—"And as to you, Mr. Taylor, who are thought a rather particular gentleman, you are no rule,—gentlemen may do as they please; but that bold girl, whom I have ordered and commanded, at her peril, not to look to that woman, or speak to that woman, whom you, Mr. Moir, if worth your ears, sir, would have had removed from this neighbourhood, long and long ago, as a nuisance, sir, there where she stands,—to laugh at your wife and ruin your child," &c. &c.

Now my friend Peg's crime was meditating housebreaking, now ruining girls. I could make little sense of this, though I was forced to perceive my god-daughter's error in disobedience.

"My dear Mary Anne, it is clear you must not speak to poor Peg again. Perhaps Mrs. Moir is right in thinking her not quite the best sort of even speaking acquaintance for young women. And you, my good madam, must be reasonable with *our* daughter. Though she is your own property, I doubt if you know half her value." Mrs. Moir, though far enough from a reasonable mother, had about her a good deal of the she-bear's kindness for her offspring. She also began to sob and cry in her own obstreperous fashion.

"I would have Mary Anne value herself, Mr. Taylor—keep her own place, sir—and show a proper pride, Mr. Taylor."

"I am afraid my friend, Mrs. Plunkett, fancies she shows even an improper pride, ma'am. Only last week she was hinting to me of the changed face Mary Anne shows her." This was well thrown in; but Mary Anne's quick and warm honesty spoiled all.

"I have not till yesterday spoken—and scarce looked to her for six months—scarce since I returned from Bognor. If she were not a generous-hearted, a high-minded woman, she would not now have forgiven, or have spoken to me."

"Grant me patience! Do you hear her, Mr. Taylor?—do you hear her, Mr. Moir?—Is the girl mad?—An Irish barrow-woman, an orange-woman *condescend* to speak to my child! Girl, girl, what have you to say to that vagabond? are you mad outright?"

"Gude help us a'," ejaculated David, driven to his mother-tongue, and he ran out of the room.

Mary Anne lay weeping, her head on the table:—she quickly raised herself, and in a voice whose tones I shall never forget, breathed out,—"Mother, I am not mad—not yet mad—O, spare me then to-night, dear mother, if you would not see me so. Strange things are about me. Spare me for this night. I know how you love me:—and you will rue it all your life if you are too hard with me to-night. I should like to go to bed now."

I could see that the mother was affected, and even alarmed. I promptly interposed, and approached Mary Anne. "Certainly, my dear, you shall go to bed—do to-night whatever you will: I answer for Mrs. Moir. Indeed, I mistake if you are not far from well to-night. I stooped over her where she sat, my back turned to the mother, who stood by irresolute. I held the poor girl's burning hands clasped within both mine. She leant down her head, and kissed my hands repeatedly, passionately breathing, "My own good god-father,—*my good genius!*" The tears that fell on my hands were scalding; but the fever of the mind was, I feared, yet higher than that which raged in the blood. I would have given more than I need name to have had a few minutes of confidential communing with the distracted girl. I saw her heart, with all its load of sorrows, was in my hands. She ventured to kiss her mother, but in silence, and left us. The good lady followed in a very few minutes; and immediately returned to say, "The foolish thing was already asleep!"

We now had tea, and when Mrs. Moir left us again to gather intelligence for a second bulletin, David assailed me with a whispered "I beseech ye, Mr. Richard, speak to the wife to be less severe with the bit lassie! They'll break my heart between them! She sees nae peer to Mary Anne, I ken that; and yet the *yammer* for one fault or another is never out of her mouth. Of the thousand ways the women-folks have of spoiling their dochters, Mr. Richard, the worst, to my mind, is this endless *yammerin* and *yatterin*, and *nag-nagging*, for little or nothing. And the worst of all is, these *teuch* (tough) hearted auld folk little think how their bitter words blister and crush a tender young spirit. I mind myself the bursting heart I used to have, even when *man-muckle*, when, if I had sleeped an hour ower long in a morning, or let the young beasts I was herding get a rug o' the green corn, a thrawn auld sorrow o' a bachelor uncle I had would have prophesied the ill end such sinful beginnings would come to, and that less than the gallows, the end just made by one Rob Gunn, hanged at Aberdeen for horse-stealing, would not atone for backslidings like mine. These are cruel, senseless sayings, Mr. Richard! They are worse than foolish that drive young creatures to judge ower hardly o' themselves, and lose self-respect for mere nonsense. There was ne'er ony thing lost by showing kindness to a kindly nature. I wish our minister would preach about that." In honest David's strictures on moral education, so far as I understood them, I fully concurred. Mary Anne was reported still quiet, and asleep. I was, at least, aware that she wished to seem so, to avoid all conversation for the night.

From my own window I saw her chamber was dark by midnight; and I went to bed, ruminating on the events of the evening, and more perplexed than ever. It was idle to torment myself. I was convinced that she wished to give me her confidence, and with it the power of aiding and counseling her; and I subdued my anxiety and curiosity, resolving to visit her chamber next morning,—a liberty which I had always enjoyed, in common with her father, when she was really sick.

I was taking my morning coffee, in the struggling light of a gray damp day-break, when Mrs. Moir's maid servant brought the hasty tidings, that "Master had gone early to the bank; *Missis* was in *hicksterics*, and Miss Mary Anne was run away."

I lost no time. The slight natural antipathy which existed, and all the petty tiffs and resentments of eighteen years, gave way before the extreme distress of my neighbour; violent and undignified in expression, but deep and real in suffering. She accused her husband, she upbraided myself, she railed at the Irish woman, she

execrated her own harshness, and blamed the whole world, save her "Dear, beautiful child—her Mary Anne—who must, she was certain, have thrown herself over Blackfriars Bridge, for fear of being scolded for the loss of her boa—there could be no doubt of it."

The only thing in which the unhappy woman showed reason, was, that I should lose no time in setting out in my search, and in being persuaded to put off her pattens, remain where she was, and keep herself and her clamorous maid within doors; and to leave me, instead of the constable, to deal with Mrs. Plunkett. I left her rather more composed by my assurance, that the catastrophe she dreaded was utterly impossible, and my promise of not returning without tidings of Mary Anne.

This interview occupied a few minutes. My first hope was Mrs. Plunkett, who was already on duty, talking to herself, rubbing gently, and piling her oranges and lollypops. She accosted me in her ordinary way, with the genial, heart-reaching courtesy of an Irish greeting,—

"Morrow! Mr. Taylor, sir,—and a raw one it is to them poor creatures that suffered. I see where you been down the lane. The mistress is among her troubles, this misty morning, it seems:—well, sorrow bit now myself heeds that same, if no harm come to the good, pretty girl. Och, devil a care for the ould one, Mr. Taylor, sir." She laughed good-humouredly.

Though Peg was a generous woman, her generosity was of the national complexion. It was rarely displayed in magnanimity to an enemy, or even to a fallen foe. "She'd be glad to have the little girl at home to-day, even to spaike to the Irish barrow-woman."

All my address could extract little information from so stanch an ally and auxiliary as Mrs. Plunkett, who hated her insolent English neighbour with a hatred of twenty years' standing; and, besides, reckoned herself of the daughter's faction, and opposed to the mother. Any sacrifice would have seemed slight, compared to the dishonour of betraying Mary Anne, or to the *meanness* of treachery. "I'll tell ye nothing, Mr. Taylor; what should I know of the little girl?—I seen where ye come from, sir, down the lane. What should I tell ye of the poor girl."

I could not disabuse the woman of the belief, that to tell of Mary Anne's doings to her mother was wrong and treachery. I had lost my time and my eloquence. I became angry at last, and was so far left to my own folly and ignorance, or forgetfulness of Irish nature, as to threaten a magistrate,—that insolent threat too familiar to London lips. All her Hibernian blood was in a rage. I wish some of our cold, stiff tragedy heroines had seen Peg, as she said,—

"And ye would—would ye?—ye would—to the widow stranger woman, who sought honest bread under the shadow of your roof for twenty years; for the bed-rid mother, and the fatherless little ones?—Och, no, Mr. Taylor, and that ye would not:—and, excuse my passion—but ye should not have said that same, sir." I was, indeed, heartily ashamed of having said it.

"But for a hasty word, ill would it become me to forget what ye done for me and mine:"—I had attended the family with my best skill in typhus, but I fear they had little faith in me—"or showed the will to do any way, which is the same—and what *she* done!"—And the grateful woman kissed the little ebony cross, with which I had presented her on the death of our common friend, Sister Agathé, whom she regarded as a saint, and, for aught I knew, on holidays invoked as one. "And if it be, sir, that it is as you say, for the little girl's own good, that I should tell you all I know, then I will, if you swear on the Book, not to acquaint the mother: by the same token I had a notion that I ought to tell you, and had a drame about that same this last night too." Here a female friend and country-woman was called from a neighbouring cellar.

"Morrow! Mrs. Tuomy. She is a true creature, Mr. Taylor,—I would trust her with a barry of gould that's Mrs. Tuomy. Will ye just give a look to the barry whilst I run up to the place with the doctor, to see the ould lady, poor ould baiste, and sure I'd do more for yourself again."

"With all the veins, Mrs. Plunkett, ma'am, and compliments to the ould lady this same morning." And these civilities past, I followed Peg's stoutest campaigning stride to the garret, where her bedrid ancient mother, so affectionately named "the dear ould baiste," had lain for fifteen years.

"Welcome to the place, sir, and to the seat in it! She'll be glad to see you, dear ould baiste. Moder, dear, this is the doctor!" Peg bawled. But I have no time for this scene, which Peg had tact enough to perceive I was too impatient of. She took, from a small brown, broken tea-pot, or pipkin of some kind,—part of her lollypop apparatus, I believe,—a number of letters or papers; blotted and tear-stained scrawls, but in the well known hand-writing of my poor Mary Anne. There may be persons who would have thought it dishonourable to have read these writings. I had no scruples or admonitions of conscience. I loved the writer well, and my heart gave my eyes free warrant.

"And you were the messenger in this affair?"

"To Newgate prison, sir?—then in troth I was. I don't deny it, Mr. Taylor. Could I refuse the poor cratur, who, the thin white face tould me, was on her knees to me, as for the bare life, to go? In troth, then, I could not."

"I do not blame you; but tell me, and quickly, what passed." I looked to the papers again. They were—blotted, confused, interlined, as they appeared—the history of a criminal case—materials for a brief, in short—full of pathetic pleading, heart inspired eloquence, and, what was more surprising, acute reasoning on facts and minute circumstances of evidence, though the writer was only poor Mary Anne, and this beyond all doubt, her first law-paper.

"Go on, Mrs. Plunkett! I am all impatience."

"Then, first, the poor girl swore me on the book, or, all as one, take my word and honour, as an Irishwoman, never to tell who sent me there; for, somehow, she saw in the papers, that Mr. Lyndsay Boyle, who is a gentleman born, was put up by them dirty scamps, for some thrifle of money 'bezzled."

I held the brief; so I knew the whole history, and I was impatient on other points. Mr. Lyndsay Boyle's habits of thoughtless extravagance had led him into difficulties. He had exhausted the funds, and offended the feelings, of his relations. He had also quarreled with his rascally employers, a flash wine and spirit company. He was in possession of their dishonest secrets of trade, which he had detected, and they were resolved to ruin him, and send him out of the country. It was an unhappy affair, and, very probably, a case of infamous conspiracy. But how came my unfortunate god-daughter to be involved in it?

"No more than the babe to be born to-morrow knew the poor cratur, Mr. Taylor, though the boy was once, in a way, her bachelor; but was she to see him hung?"

"Hung!—not so bad as that neither. It is only transportation—a case under Sir Thomas Plomer's act,—that merciful and equitable law, Mrs. Plunkett, by which the pinched embezzler of 5s. is more liable to punishment, ruin to himself, and all connected with him, in fame, fortune, and happiness, than the embezzler of £50,000, as the latter has a thousand better chances of eluding justice in the first instance, or of baffling it in the end. The sum for which this foolish young fellow is committed seems £4, 10s."

"Just that, sir—Mr. Tim Byrne, a countryman, a

Treda* man, I met in Newgate, tould me all about it; for the young gentleman himself is, they say, mad entirely with the grief and affront—and indeed he looked like it,—the shame of the world on them! to harm so handsome a boy, and to break the heart of the poor girleen for such a thrifle."

Mrs. Plunkett would look neither to statute, nor common law, nor offence to justice. She stuck to "ruining a boy for £4, 10s." I had difficulty in keeping her to her text, on which she discoursed something at large.

"Och, little could I make of him, though I was as cunning as the ould One not to mention the girleen. He looked mighty high, and hardened, and proud at first; and whistled, and tramped about the yard as long as I stood, and made a laughing too. 'And how is your neighbour, old David Moir, and his pretty daughter?' says he. 'All very well, but will be sorry to the heart for you sir,' says I. 'Oh, tell Miss Mary Anne not to concern herself about me;'—and with that the whistle began again; and then he shouted 'damnation!' and round on his heel, and away from me, for we were in the yard. And with that comes my countryman, Tim Byrne, who makes his bit of brade, poor sowl, writing of letters for the prisoners, and the like. 'He is a fine young man, Mrs. Plunkett, ma'am,' says he; 'and if you care for him or his, you must get an attorney, ma'am, and a counsel, and a brief drawn, and no time to lose; and five pounds at the very laste.' And with that I came home to Miss Mary Anne, waiting me here, poor dear! 'Not concern myself?' cried the poor cratur. Had you but seen her, Mr. Taylor. 'Och! how can he imagine his friends could help that!' Troth, had I borne her, I could not be more sorry for the young cratur; and he was a gay frank boy, too. Miss Mary Anne durst not tell the mother or the father; and five pounds were to us the Bank of Ireland—to her and myself, I mean; for if I had it, Mr. Taylor—"

"Well, what did you?"

"Och! one or other of us,—I believe it was herself,—thinks, 'Sure Tim Byrne could tell us something.' So back I goes, just as they were locking up, and Tim going home for the night; and I *traited* him myself on the way back, not to be bringing gin to the place, and poor Miss Mary Anne, who is a genteel cratur, waiting in it—the *sister*, as I called her to Tim:—no occasion for that vagabone knowing every thing. So he tould her the whole story: and all night long she sat up and wrote these scribbles, myself getting candles; and yesterday morning early, I took the clean one—the brief it is—to Mr.——, with two gould sovereigns; and the cruel baiste, putting that in his pocket, would not look to me. 'More money!' says he, 'I can offer no counsel on this long memorial with a paltry two sovereigns; and back I came to the poor girl, who looked like one distracted. The sessions going hot on—no attorney, no counsel, no witness, and no money to procure them. Tim frightened the poor girleen out of her little wits; and indeed, and in troth, I fear he is a bit of a rogue, Tim. 'Could not you get something on them ear-rings, ma'am,' says he; and out came the bits of ear-rings—down in his hand—and away she fled, and I saw her no more."

"And were is Mary Anne now, at this moment?" was my impatient cry.

"And, indeed, and in troth the pace knows, Mr. Richard! Only this morning, the cratur that slaves for the ould woman tould me the pretty bird had flown; and where she is gone was the very thing I meant, sir, to ax yourself: and if I were in your place, sir, I would have the young things married out of hand, and let them comfort one another." I was already half way down the crazy stair. "How could you, woman, delay me in this way?"

"Then, indeed, Mr. Taylor, darling"——

"Go to the ——! I mean go to your barrow, Peg; and if you see Mary Anne returning, bring her here to wait me."

"Then I will, jewel: and why would the ould lady cross her? She took her own way—why cross the poor girl, if it's that young man she fancies?" "Hush, hush!"

Newgate prison was my aim; but influenced by Peg's information, as this was in the heat of the sessions, I went first to the Old Bailey—that wholesale mart of English criminal justice, where life, character, happiness, peace of mind, are, from six to ten times in one hour, going! going! gone! Who that has once seen the general aspect, and watched the proceedings of that yawning mouth of Avernus can ever forget it? Why have we not moral as well as historical painters? Hogarth has left us some striking lessons, and Cruikshanks has done something—the Old Bailey alone, every day of the sessions, might furnish numbers without number. It was about ten o'clock when I entered the court. Before eleven I had seen at least six cases tried, and as many juvenile thieves found guilty, and ready, at a future day, to be sentenced in the lump. I mean, in one day, or rather one hour, to be condemned by the score to the hulks, transportation, whipping, or imprisonment. There is complete division of labour here. I endeavoured to ascertain what cases stood next to come on. No one could tell. Probably no one distinctly knew. It seemed all matter of accident or caprice; and all was crowd, hurry, buzz, bustle, and confusion. I was at a loss whether to remain where I was, or at once go to Newgate, when my resolution was fixed by the mumbled call of a prisoner, whose name, at least to my fancy, resembled "Lyndsay Boyle;" and the young man himself was brought forward, escorted in the usual manner, changed, indeed, from what I had seen him some months before. I could not look upon the poor youth without deep interest and compassion. His case appeared to excite considerable curiosity. The court became crowded and choked up by all kinds of people. I was pushed back, and, from the noise, confusion, and hubbub on every side, it was impossible, from the place were I stood at last jammed in, to hear one word distinctly of the trial proceeding in dumb show. I looked on the unfortunate culprit, and the pantomime of justice performing before me, with a swell of indignant feeling which I shall not describe. The attorney, with whom I knew poor Mary Anne had left her hard-earned money, was visible in the crowd, but distant from the bewildered prisoner, gesticulating violently, as if calling or pretending to call to the officers of the court to get forward his witnesses—searching, or pretending to search, for the counsel who held the brief, and who could not be found. The bench *naturally* grumbled. I was told that very unusual patience and indulgence were shown to the prisoner. It was indeed fourteen minutes by my watch from the time he was placed at the bar till the thrilling shriek of a female voice followed the awful *guilty;* and in the gallery, to which I now first looked, I saw a green gauze veil falling with the sinking head. The shriek of woman's agony is not so rare in that court as to produce any very marked sensation.

"*Remove the woman!*" was but a customary official mandate. I pressed forward to take my god-daughter from the officers, who hastened to conduct or carry her out.

"He is sold—the poor fellow is sold!" were the indignant whispers and exclamations of the respectable persons around me, in whom free notions of the rights of property, and the habit of thieving, have by no means obliterated all sense of natural justice, whatever the

* Drogheda, I believe, is meant.

virtuous may think. Their sympathy with Boyle was lively and intense. Many of the poor wretches had probably passed through the same ordeal, or were liable to it. As I pushed through the crowd, I came upon the attorney, who had been apparently in hot pursuit of the counsel, now first found.

"Bless my soul!" cried the attorney, "but this is really unlucky." Has that man a soul to bless himself with?

"Ha! the case closed," replied the other, wheeling round; and, flirting his bundled briefs, involving the fortunes of probably some other half dozen wretches, he scampered off to some other court.

"And is my evidence to be wholly useless?—not to be heard, sir?" said a decent-looking young tradesman who now found the attorney that had been in search of him. "I have waited here every day this week, and this is Thursday, to give evidence, which, I am morally certain, would have cleared Mr. Lyndsay Boyle."

"We must now see what can be done through the pardon power," said the attorney. "If he has friends, there is no fear of him yet." "But if he have none?" said the witness. The attorney shrugged his shoulders. "I have a dozen cases here to-day—good-b'ye, sir—write to his friends, if you wish him well, to move the pardon power—even that takes cash—make way for the lady—fainted, poor thing!" I claimed the unfortunate girl from the men who almost bore her. At the sound of my voice she revived. She flew to me, clasped me, clung to me, and then lay insensible in my arms, till the coach, into which some of the humane bystanders had lifted her to me, stopped at my brother's door.

"Then," she first murmured, "*you* saw it all."

"I did."

"Just God, who judgest! and was that a trial? I never before saw one. It had ended before I knew it was begun. GUILTY! O, what will become of him? And they say he is half mad already. If the king were to know this, he would pity him; and indeed, indeed, he is not guilty." I could not deprive the poor creature of the hope that was the growth of her despair. "Indeed, I don't believe him guilty, Mary Anne; at least, I am certain the punishment is most unequal—far exceeds the crime."

"You don't! you don't!" she cried, her eyes flashing over me with a wild joy; and she covered my hands with her burning kisses.

"You must be still, my dear Mary Anne; you are grieving me, and destroying yourself; you must be composed, and trust to me."

"To you! O, yes! to *you*, my best, my only, my true friend, MY GOOD GENIUS!"

"I have brought you here for a few hours. The family are out of town to-day: you must go to bed, and be well, and in the evening your mother will take you home; and no one will know our affairs but ourselves." I was pleased with my own arrangement—pleased that my gentle and prudent sister was not at home, who, I had some doubts, would, with all her indulgence, have been rather disposed to condemn the conduct of my god-daughter as a very flagrant breach of female propriety.

I told the necessary lies to the housekeeper, who was well acquainted with my god-daughter; and the patient, "suddenly seized," was regularly put to bed, and her chamber darkened. I returned home. When Mrs. Moir heard where I had left her sick daughter, the *box* occurred to her as the reason of Mary Anne's early flight, which, I allowed her to believe, was, as she imagined, induced by dread of her righteous displeasure for the loss of that piece of gear; the loss of which I was aware Mr. Attorney —— had made pretty certain.

Under what temptation, I am at a loss to say, but involuntarily my steps turned to Newgate. Under this same statute against *embezzlement*, I had known gross injustice and oppression practised. To city merchants, attorneys, and dealers of all kinds, embezzlement, to the smallest extent, appears the blackest and most atrocious of crimes: hanging is too good for it. From Mary Anne's *brief*, or *memorial*, it appeared that arrears of salary or per centage due to the prisoner, very considerably exceeded the sum he was charged with having embezzled. It had been paid by the tradesman who stood ready to be his leading witness, on a Saturday. He had granted a regular receipt for it; but on Tuesday it had not been regularly paid over to his employers, and that night he was arrested. One or two gentlemen in business, with whom I talked the affair over on my way to Newgate, gave me very little hope. Fourteen years' transportation to the penal colonies was really no such great hardship to a young fellow who might make his way there very well. The jury would not recommend him as a fit subject of the pardon power, assuredly; nor would a single gentleman in the city say one word in behalf of a man convicted of the dangerous and growing crime of embezzlement. The extravagance and dishonesty of clerks were getting beyond all bounds. Mr. Lyndsay Boyle attended races, probably gamed; kept a couple of horses, and, at least, one mistress. I need not say, that though the youth had been foolish enough, there was not one word of truth in these statements, as I found, when I afterwards rigidly traced his whole course of life and conversation.

But, in the mean time, I went to visit the prisoner. Our previous acquaintance had neither been very intimate nor cordial. Now he received me with coldness and pride enough, and talked of his own condition in what I may fairly term a style of unbecoming bravado; but by and by he lowered his tone; and on clearly perceiving that I really had a strong impression of his innocence, and questioned the fairness of his trial, I gained him at once. He became as frank as he had been haughty; and placed so much confidence in my sympathy as, on slender solicitation, to tell me his whole story, and to all but weep in my presence, without feeling humiliated by the exposure of his true feelings. The neglect of his friends stung him the deepest. He had written and written home. True, there was little time; but could they not have sent—could they not have flown! He never once alluded to Mary Anne or her family, save to say, very coldly, that he "had been weak enough—*mean* enough—to apply to David Moir for a loan of five pounds to procure legal assistance, and had received no answer." I afterwards learned that it was the furtive perusal of this letter, intercepted by her mother, which had made my god-daughter acquainted with the fate of Boyle. We had conversed for at least two hours, and I was now really, for his own sake, and that of justice, and quite independently of Mary Anne, animated by the desire of aiding the young man to clear up this unhappy transaction. When we were about to part, and while he pressed me to return to see him, the jailers, or their assistants, ushered in a party of gentlemen with an unusual bustle and ceremony, one of them evidently just off a long journey.

"My uncle!" cried the prisoner, springing forward to meet a gentlemen attended by the common sergeant, the chaplain of Newgate, and one of the Alderman, who, if I remember aright, was Mr. Alderman Waithman.

"And I am too late!—Lyndsay, what dreadful disgrace is this!" The gentleman sat down without seeing, at least, without accepting the hand his unfortunate nephew had held out. The young man changed colour repeatedly, and, indeed, appeared so painfully agitated, that I would have gone away to spare my own feelings, had he not silently held me.

Scenting the prey from afar, the attorney in the case followed the gentlemen into the private room we obtained; and Boyle's uncle, who belonged to the legal pro-

fession, heard him "on the merits." He made statements, which, from Mary Anne's memorial, I took it upon myself to contradict and explain. The uncle now held out his hand to his young kinsman, who appeared astonished to learn that he really, after all, had enjoyed the benefit of legal assistance at his trial. The attorney had still to play his part; and as several functionaries were present whom it was not prudent to offend, I had the pleasure of hearing judge, jury, agent, and counsel, exonerated from all blame. Nothing had gone amiss; the trial was full and fair; every one had done his duty, and no one was in fault, save "the poor young woman, the prisoner's wife or sister, who was *so* dreadfully agitated, that she had made a memorial *so* long and confused that no counsel could read it, and was *so* late of lodging the fee, &c.; now there was nothing for it but the pardon power."

I thought Boyle's eyes would have pierced me during part of this discourse. I left him with his friends, by his uncle's direction, writing to his mother, and went to my brother's and saw Mary Anne.

"Are you quite alone?" said the languid girl. "Quite alone!" There was a long pause. "And have you any news?" "Very good news." She started up from her pillow, looking anxiously in my face. "Well, lie down till I tell you." "I am lying." "Turn your eyes from the light, then. I left Mr. Boyle with an uncle from Dublin, the common sergeant, the recorder of London." "His uncle, Mr. Lyndsay?" "How the deuce should I *know* the lad's Irish relations? Alderman Waithman, and a Mr. ———, a particularly rascally attorney." "Oh!" sighed the patient. "And now I have no doubt but that a pardon will be obtained for Boyle,"—she sprung up again—"in a few weeks, perhaps, so we need trouble our wise heads no more about him."

"Oh, no! no!" sobbed my patient. "This is, indeed, all *we* could desire. He will be pardoned; and he is innocent. But do the innocent need pardon? *He* is innocent."

"Hush!—I hear your mother's voice."

"O, that is enough—he is pardoned." There was another pause. "And was that all?" "All! Mr. Boyle had the delicacy not to mention to me the name of any former friend."

"That was right," sighed my patient, becoming very pale, and sinking down on her pillow. "Now he can never know; no one can guess. It would kill me should any one suspect the wild things of these last two days."

Mrs. Moir entered on tiptoe. I used a little finesse. "Sleeping and decidedly better," was my whisper—"fever much lower—ran so high that it was thought best to cut off her hair!"

"My Mary Anne's beautiful hair! her father will be so vexed!" "Well, but don't vex her about it—never mention her loss!"

"Certainly not—and though her father likes that Scotish *snood*, I always thought Mary Anne looked much nicer in a neat tidy cap."

Three days after this my god-daughter walked with me for some miles, quite recovered, she said; but it took a time. In a few weeks, however, she went into my brother's family for the winter, on the condition, that from Saturday to Monday, she was to come home to our lane.

With all the enquiries, and all the influences of back stairs and front that could be exerted, it was full two months before the pardon power released the prisoner acknowledged to be free of all crime. By this time we were become great friends. I had seen him often. Perhaps adversity had been of service in correcting his faults of pride and heedlessness, and something might be attributed to the removal of my original prejudices, for now I not only merely liked, but, on increased intimacy, conceived a highly favourable opinion of Mr. Lyndsay Boyle.

One of his first visits, on his enlargement, was made to me. He was about to return to Ireland with good prospects; and having a great opinion of my skill, save the mark! in *vertu*, he wished my directions in laying out some of the money his liberal uncle had supplied him with in pretty things as presents to take home—cameos, or mosaic ornaments, or trinketry of some kind or other. I took him to my friend, Mrs. G——'s shop, and his own good taste led him to select her fairy sculptures. While he bargained with the lady, G—— talked apart in an under voice to me:—"The great lady has returned from Brighton at last, Richard; and she is charmed with the young girl's hair.—You can't have forgot the girl who sold Mrs. G—— her hair; whom you scampered after like a madman that night in October last. Don't you remember the girl's *hair* that you said, in your own wild way, the old Greeks would have raised into a constellation, and adored by the name of Mariamne."

"Mary Anne, my love," cried glib Mrs. G——, who, though deeply engaged in her Italian merchandise, had, like all clever shop-women, at least three pairs of eyes and ears corresponding; nor were young Boyle's deficient. As we walked along, he said, *apropos des bottes*, "By the way, how are our old friends, the Moirs? Miss Moir is not at home I believe." "My god-daughter resides for this winter in my brother's family." He walked with me to the door of the house, and was *not* invited in. We stood on the steps. "Do you not, pardon me, Mr. Taylor, think Mrs. Moir an exceedingly disagreeable, ill-tempered woman."

"That is an odd, if not a severe remark: most ladies can be disagreeable enough when it so pleases them; exceedingly disagreeable, is a strong phrase."

"Were it not for that woman;—now, David is an honest old Trojan—I like him." It was not my business to spell out Mr. Boyle's meanings; he fished out of me that I was, that same evening, to attend my brother's children and their little governess to the pantomime. He was in the box before us with a cousin I had formerly seen; a lad just entered at Lincoln's Inn. I was first made aware of his presence by my god-daughter, who sat by me, being seized with one of her ague-fits, that universal shivering which was her strongest manifestation of feeling, when soul and body maintained the passionate struggle. Not a feature was discomposed; nor could any one, save myself, have guessed that her emotion arose from any thing save severe external cold. "O, dear, poor Miss Moir is *so* cold!" cried one of my little nieces, wrapping her fat arms round Mary Anne, as she pushed farther into a corner, and drew her shawl the closer. As the performance proceeded, keeping her eyes steadily fixed upon the stage, she talked and even smiled with the laughing children and myself, and showed so wonderfully little of affected surprise, when Mr. Lyndsay Boyle ventured to recognize her, and when she coldly bowed to him, as to baffle even me.

"I thought she had been younger, Lyndsay," was the whisper of the cousin. "She looks quite an old woman, or at least a young matron."—"She is not so very old, though; but that ugly cap,—it covers her glorious hair."

"*Glorious hair!*" returned the youth, laughing at the extravagant phrase; "Do you hear Lyndsay's description, Mr. Taylor?"

"Beautiful hair *she had*," was my response. "And why has not now?" "Because she cut it off in a brain fever, one night in October last," was my whisper—a sally repented as soon as made. The young man started up suddenly, placed his handkerchief to his brow, and left the box. The cousin followed, imagining some sudden illness. I was almost provoked by the cold, demure air, which Mary Anne wore throughout the rest of the night; and was only reconciled to her, when I had, unintentionally, worked up her womanly feelings to a rage of pride, full six months after Boyle had left London,

without any attempt to see more of us. But to that paroxysm I have already alluded; nor did I ever again dare to hint at the possibility of Mary Anne having fallen in love, without due wooing, and all the proper rites of courtship.

Mr. Boyle had been franker in explanation with myself; but I was prudent this time, and thought silence, as to his sentiments, no bad auxiliary to the maidenly pride of my god-daughter, disdainful as she was become. If rash and impetuous in her love, Mary Anne was, at least, abundantly prudent in her marriage. She appeared for some years to show even that natural vocation to the serenity of old maidenism, which some women really have—let men say as they will. Her mother had been dead for three years, and her father long retired from the bank before the united entreaties of her friends, could shake a resolution early formed against the "honoured state." She has now, however, been for above seven years the wife—and, I have reason to believe, the happy one—of a thriving and highly respectable distiller in the county of Antrim, and the mother of I know not how many fine children. Her father, who lives with her, is, I find, extremely useful to her husband; and happier, he writes me, than ever he was in his life before. At this very period, Mary Anne is still spoiling her third boy, Dick Taylor, who, by David's letters, is almost as great a genius and prodigy as his name-father—according to Nurse Wilks—was fifty years ago. Specimens of his poetry have been sent me; and of his painting I possess a "chimera dire," which I am credibly informed is a horse. Mary Anne's last letter to me begins, "I am writing, my dear god-father, with Dick in my lap. Indeed every body says he is the most charming little fellow they ever saw. He insists on making these scratches for a letter to "Grandpapa Taylor."—But the charm of my Mary Anne's epistles is, that though I have not seen her for seven years, each is written as if I had kissed her last night. We shall never grow out of acquaintance. My brother's family visited the Moirs last summer, on their tour to the Giant's Causeway. The most novel intelligence they brought me was this from my sister Anne:—"And gracious, Richard, could you ever believe it,—Mrs. LYNDSAY BOYLE is growing fat!—Her very last words to me, with tears in her eyes, after I was in the carriage, were, 'Will my god-father *never* come!'"—Yes, before I die, I shall see *ould* Ireland and my dear Mary Anne!

From the Liverpool Albion.

NAMIK PASHA.

His excellency Namik Pasha, General of brigade of the imperial Ottoman army, grand envoy of the sultan, who comes to this country on a special mission from the Ottoman court to the court of London, arrived at Dover a few days ago. His excellency having been expected, caused the pier to be crowded long before his arrival, and among the anxious expectants were many very beautiful and elegantly dressed English ladies, *whose hearts were beating*, to use their own words, *with anxiety to see the Grand Turk*. As the steam-boat approached, his excellency was standing on the fore-deck of the vessel, surrounded by five Turkish servants, all wearing the Turkish cap, and in a few moments she entered the mouth of the harbour dashingly, under the British flag, which was hoisted as a mark of national respect on the occasion. Some little accident occurred in consequence of the state of the tide, but it was speedily obviated. His excellency instantly started for London, under a salute of 15 guns. He appears to be about 30 years of age, is about five feet eight inches in height, of slender, gentlemanly, and smart appearance. He wore the Turkish red cap and tassel.

From the Winter's Wreath.

TO THE RIVER DOVE.

BY EDWARD W. COX, ESQ.

AUTHOR OF THE "OPENING OF THE SIXTH SEAL," &c.

Oh! would to heaven I were as thee,
Beautiful river, fair and free!
Say, crystal waves, say, where have ye been,
Whither ye wander, what have ye seen?
—From the first dim smile of the morning ray
To the last soft sigh of the parting day,
Through the solemn hours of the silent night,
Thou goest along in thy rapid flight,
Murmuring, musical, fearless, and free,
Beautiful river, would I were thee!
—In the womb of Earth
Thou hadst thy birth,
In the deep dark gulfs were light comes never,
And some cold black cave
Nursed thine infant wave,
In realms that have shut out the sun-beam for ever.
But upward thence didst thou win thy way,
Seeking in silence the place of day.
Was it a spirit who found thee there,
And pointed thy path to our upper air?
Was it some Seraph that wafted thee
From the fathomless profundity?
Some Naiad sure with her wood-voice clear,
From thy dark cold cradle hath called thee here!
Stainless as the morning beam
Rose to light thy crystal stream,
Emblem meet of purity,
Bright, as brightest diamonds be;
From thy mossy hidden fountain,
From some heavenward rising mountain,
Or from some more modest vale,
Down amidst the daisies pale,
Voiceless all, as ever is
The intensity of bliss,
Upwards welling didst thou come,
From thine unseen, lonely home.

Then, on—on—! Like a bird that long
Hath sung his melancholy song
In a prison cage, when Liberty
Hath bidden him again be free;
He shakes his plumes, and he spreads his wing,
He never is wearied of wandering
Through the bower and the grove, that were once his love
Through the ivied haunts in his sunny vale;
And, all day long, doth he breathe a song
Telling his amorous tale:
Thus, like the bird but late set free,
River, thou goest with song and glee,
Through the copse-walk cool and the forest shade,
Through the green clad vales and the silent glade:
Amidst rough rocks in ruin piled,
Thou wanderest on like an innocent child,
With dance and song, in thy sportive play,
Over the meadows, away, and away!
The first faint blush of the morning beam
Comes glancing down on thy spotless stream,
And noon, in thy glassy fountain glowing,
Shows where the waves of light are flowing;
The parting summer's latest sigh
Breathes over thee as it passeth by,
And the wing of her zephyrs, while fanning thee,
Scarce ruffles thy pure tranquillity!

Where thou comest wandering—lo!
With verdant life the valleys glow;
The bursting bud, the grass-blade green,
The infant flowret's face is seen;

And, o'er the bosom of the Earth,
Nature's varied robes come forth.
So, throughout the smiling lands,
With thy viewless Spirit-hands,
Thou, the fruit, the flower, the tree,
Scatterest benignantly.
Many a modest beauty dwelleth
Where thy leaping current welleth;
As thou murmurest along,
Wide the echoes wild reply
To the music of thy song,
Making pleasant melody:
And so thou flowest fair and free—
River! would I were as thee!

From the Asiatic Journal.

The Last Days of Pompeii. By the author of "Pelham," &c. London, 1824. Three vols. Bentley.

Envy and malignity themselves cannot deny to Mr. Bulwer powers of no ordinary kind. Some persons may object to the gaudy and enameled brightness of his descriptions,—to the unvarying splendour of his diction, which is gathered from the distinct realms of poetry and prose, realms at least that ought to be distinct,—to the want of repose even in his familiar dialogue,—to the rainbow tints of his colouring, too seldom relieved by soberer and more placid touches,—to that peculiar character of his writings which makes his readers in some sort a sharer of his own efforts,—in short, to his determination on all occasions, great or small, to dazzle and surprise. But it is the taste of the age, and as it is always easier to conform to a prevailing taste than to inspire a better, he who writes for profit, and has already secured his reputation, cannot be expected to make the heroic sacrifice of renouncing it. The inconvenience of this mode of writing is, that it encumbers the narrative, which flows languidly through the beds of roses and parterres of sweets that so frequently turn awry its current. Yet it might reasonably be hoped of so popular a writer, that he would have stood more aloof from the literary vice of the day, and disdained to take his stand among the feverish worshippers of the *intense* style of writing—a style framed only to make strong and transitory impressions, and too liable to degenerate into dreamy and confused rhapsody.

A single passage from the work before us will explain our meaning better than pages of didactic criticism. An old man, one of the prohibited sect of Christians, enters a private assembly of those worshippers. The simple circumstance of his caressing two infants, sitting on his knee, is thus told: "It was beautiful to see! that mingling of the extremes of life—the rivers gushing from their early source—the majestic stream gliding to the ocean of eternity. As the light of declining day seems to mingle earth and heaven, making the outline of each scarce visible, and blending the harsh mountain-tops with the sky, —even so did the smile of that benign old age appear to hallow the aspect of those around—to blend together the strong distinctions of varying years, and to diffuse over infancy and manhood the light of that heaven, into which it must so soon vanish and be lost." Never, in the whole history of rhetorical composition, were so many words expended on so simple though interesting a picture. How unlike those scriptural delineations of childhood fondled by age we have so often admired in the Hebrew writers! How overlaid by imagery! How suffocated by similitude!

We think Mr. Bulwer happy in the scene and time of his romance. The fate of Pompeii is one of the most interesting events of Roman history. The younger Pliny's narrative of the eruption, and the intrepid curiosity of his uncle in exploring and watching its desolating progress, which cost that excellent and laborious writer his life, are among the fondest of our classical recollections. The disinterment of the city, after it had slept for ages in its grave, and its disinterment in nearly all the freshness of existence;—the long street of the tombs, scarcely injured by dilapidation, and still the chief entrance of the city; —the street of Fortune, with its raised footpath; its houses gaudily painted without, and the open doors admitting the view of the frescoes within; —many of its triumphal arches still unshaken;— the unfinished building, with the heaps of mortar and the scaffolding in perfect preservation,—present us with features of ancient days no longer to be traced in the crumbling ruins of edifices which have yielded only to time, the great destroyer, or to the barbarian conqueror—forms as it were of the past embalmed in the forms of the present, displaying the rare and interesting spectacle of a town suddenly disappearing in the midst of the bustle and businsss of society. Mr. Bulwer has, moreover, with great judgment, availed himself of his own personal inspection of those wonderful remains, (for his romance was written beneath the glowing skies and amidst the luxuriant scenes of Campania,) and of the admirable descriptions of Sir William Gell, to elucidate some of the obscure points in the domestic life of the old Romans, their houses, their baths, their public shows, about which Festus and Lipsius, and a tribe of purblind commentators, have perplexed themselves and their readers to little purpose.

For instance, though the houses of Pompeii resemble in general the plans of Vitruvius, the differences in detail, of caprice and taste, have thrown considerable obscurity on the subject. We recommend the description to every classical student; for if it does not explain the Roman fashion of domestic architecture,—the style of building at Pompeii approximating more nearly to the Grecian,—he will be enabled to form a correct notion of the principal outline, which is the same in all. The hall (*atrium*), the *tablinum*, the peristyle, communicate uniformly with each other. The walls of every house were richly painted. When first revealed to light, the decorations, the paintings, the mosaics, excited the liveliest admiration. Perhaps the purity of the Pompeian taste might be called into question. The inhabitants were fond of the gaudiest colours and most fantastic designs. They often painted the lower half of their columns a bright red, leaving the rest uncoloured; and where the garden was small its wall was frequently tinted to deceive the

eye as to its extent, imitating trees, birds, temples, &c. in perspective: a meretricious delusion which the elder Pliny himself countenanced as a graceful effort of ingenuity. The *atrium* of the principal house in Pompeii, which Mr. Bulwer assigns as the mansion of Glaucus, his hero, and which on its first discovery was arbitrarily christened by antiquaries "the house of the dramatic poet," was rich in paintings, which in point of expression would have been worthy of Raffaelle. They are preserved in the Neapoliton museum, and are the admiration of connoisseurs. Their subject is the parting of Achilles and Briseis, and the force, the vigour, the beauty of the forms and faces of the principal figures are universally acknowledged. Upon the walls of the bed-rooms, which were mere cabins, of the smallest dimensions, were portrayed the Rape of Europa and the Battle of the Amazons. In short, every apartment breathed embellishment and beauty. One of the rooms is called by antiquaries the chamber of Leda, from the delicate and graceful painting of that exquisite creature, presenting to her husband her new-born infant. An engraving of this beautiful group is to be found in the splendid work of Sir William Gell.

Not a hue, after a slumber of more than sixteen centuries, of this interesting city had perished; its walls as if freshly painted,—its rich mosaics, shining in undimmed splendour—the sacrificial tripod in the gardens,—chests of treasure in its halls ready to be carried away, had the uplifted blow been suspended,—in the theatres the counters of admission,—the fragments of the feast in the *triclinia*,—in the *cubicula* the perfumes and rouge of the female toilette.

It is evident, then, that to a taste like that of Mr. Bulwer, a romance founded on ancient manners and animated by ancient personages, with so many aids of actual inspection, graphic delineation, and antiquarian disquisition, was recommended by peculiar advantages. The tale in some places languishes;—the dialogue occasionally becomes prosy;—it is generally too elaborate, and what is one of the worst faults of written conversations, all, or nearly all, the characters speak the same brilliant language, lighted up by a perpetual play of metaphor, and marked by the same antithesis and contrast: Nydia the blind slave, Glaucus, Ione, however different in their moral lineaments, speak the same elevated diction. Yet it is but justice to add, that the interest is well-sustained. There are parts we could well spare;—many that good taste rejects with loathing:—for example, the ceaseless yell of the woman thirsting for the combat of the gladiators with the lion; and the too minute and too *physical* detail of those horrid shows, which almost remind us of the still more disgusting details of the modern prize-ring. But, having performed the invidious duty of giving these hints, we might indulge the pleasurable one of pointing out the felicitous touches and glowing tints of the descriptions, as well as the bold and animated delineations of character, which transport us back over the gulf of departed ages, and wake us to a second existence in the *City of the Dead*—the striking appellation given to Pompeii by Sir Walter Scott, when he visited it not long before his death.

An author is ever liable to self-deception. The blind girl is deemed by Mr. Bulwer a creation of his own. She is by birth a Greek, having been purloined by a Thessalian slave-merchant in her infancy, by whom she is taught the arts and accomplishments requisite to slaves, and having been sold by one of these traffickers in human flesh, with a concealment of her unhappy privation of sight, to a low and coarse-minded wretch, from whose scourge she is rescued by Glaucus, the hero of the piece, the sensitive creature, in whose veins rioted the glow of Grecian blood, and who inherited all the buoyancy and ardour of the Greek imagination, becomes enamoured of her benevolent patron, with an intensity of passion that drives her to sorrow, crime, and despair. The sufferings of this interesting being are traced with a powerful hand, and create an irresistible sympathy in her behalf. Yet the reader will soon perceive that Nydia is not a *creation*. She is an adumbration of Goethe's Mignon, in his *Wilhelm Meister*, the prototype from whom our great novelist borrowed the fantastical character of Fenella. Let us compare a passage of Goethe with a passage breathing almost the same feeling in the work of Mr. Bulwer, previously remarking that Mignon, in *Wilhelm Meister*, (a work of which, strange to say, we have not seen a translation,) is first introduced as a rope-dancer, and is rescued from the scourge of her brutal master by the hero. She is beautiful, but *dwarfish;* capricious and fitful in her temper, and silently in love with her protector, who feels the strongest affection for her as a child and an object of compassion,—but nothing more. Is not this the relative position of Glaucus and Nydia? We will first translate the passage from Goethe.

"She stood before him, and saw his inquietude. 'Master,' she cried, 'if thou art unhappy what will become of Mignon?' 'Dear child,' said he, 'thou art a part of my solicitudes. I must go.' She looked at his eyes glistening with suppressed tears, and knelt down suddenly before him. He kept her hands in his; she laid her head upon his knees and remained quite still. He played with her hair,—patted her,—and spoke sweetly to her."

The following sentences from the work before us convey enough of resemblance to show that Mignon had her share in the creation of Nydia. "The poor girl delightedly sat down beside Glaucus. She drew from her girdle a ball of the many-coloured threads, or rather slender ribands, used in the weaving of garlands, and which (for it was her professional occupation) she carried constantly with her, and began quickly and gracefully to commence her task. Upon her young cheeks the tears were already dried, a faint but happy smile played round her lips;—childlike, indeed, she was sensible only of the joy of the present hour: she was reconciled to Glaucus: he had forgiven her—she was beside him—*he played caressingly with her silken hair*—his breath fanned her cheek,—Ione, the cruel Ione, was not by—none other demanded, divided, his care. Yes, she was happy and forgetful; it was one of

the few moments in her brief and troubled life that it was sweet to treasure, to recall."

It is not pretended that the portrait of Nydia is a copy of Mignon. But the sources of the sympathy felt for each are the same. Both are tortured with jealousy, doubt, and despair. Mignon is, as it were, shut out from the human family by her diminutive shape;—Nydia by her blindness. The genealogy of striking characters in fiction does not often hang together by threads more palpable than that of faint and dim similitudes.

The Egyptian Arbaces is the grand figure of the group. He stands forth in the boldest relief. His sublimity is the terror excited by a man fearless of all restraint of conscience,—steeped in sensuality,—and erecting a dominion over the minds and imaginations of others, by his knowledge of the secret mysteries of Isis, whose priests are under his control, and made the instruments of his crimes. It is upon this character, which seems imperceptibly to have grown upon the author beyond the scope of its original design, that nearly all the interest of the piece revolves.

A short extract from the delineation, which is grand and masterly, may not be misplaced.

"His fame and his discoveries were known to all the cultivators of magic; they even survived himself; but it was not by his real and worldly name that he was honoured by the sorcerer and the sage. He received from their homage a more mystic appellation, and was long remembered in Magna Græcia, and the Eastern plains, by the name of 'Hermes, the Lord of the Flaming Belt.' His subtle speculations and boasted attributes of wisdom, recorded in various volumes, were among those tokens 'of the curious arts,' which the Christian converts most joyfully yet most fearfully burnt at Ephesus, depriving posterity of the proofs of the cunning of the fiend.

"The conscience of Arbaces was solely of the intellect—it was awed by no moral laws. If man imposed these checks upon the herd, so he believed that man, by superior wisdom, could raise himself above them. 'If (he reasoned) I have the genius to impose laws, have I not the right to command my own creations? Still more, have I not the right to control—to evade—to scorn—the fabrications of yet meaner intellects than my own!' Thus, if he were a villain, he justified his villany by what ought to have made him virtuous, namely—the elevation of his capacities.

"As all men have more or less the passion of power, in Arbaces that passion corresponded exactly to his character. It was not the passion of an external and brute authority. He desired not the purple and the fasces, the insignia of vulgar command. His pride, his contempt for Rome, which made the world, (and whose haughty name he regarded with the same disdain as that which Rome herself lavished upon the barbarian,) would never have permitted him to aspire to sway over others, for that would have rendered him at once the tool or creature of the emperor. He, the Son of the Great Race of Rameses—*he* execute the orders of, and receive his power from, another!—the mere notion filled him with rage. But, in rejecting an ambition that coveted nominal distinctions, he but indulged the more in the ambition to rule the heart. Honouring mental power as the greatest of earthly gifts, he loved to feel that power palpably in himself, by extending it over all whom he encountered. Thus had he ever sought the young—thus had he ever fascinated and controlled them. He loved to find subjects in men's souls—to rule over an invisible and immaterial empire!—Had he been less sensual and less wealthy, he might have sought to become the founder of a new religion. As it was, his energies were checked by his pleasures. Besides, however, the vague love of this moral sway, (vanity so dear to sages!) he was influenced by a singular and dream-like devotion to all that belonged to the mystic land his ancestors had swayed. Although he disbelieved in her deities, he believed in the allegories they represented (or rather he interpreted those allegories anew.) He loved to keep alive the *worship* of Egypt, because he thus maintained the shadow and the recollection of her *power*. He loaded, therefore, the altars of Osiris and of Isis with regal donations, and was ever anxious to dignify their priesthood by new and wealthy converts. The vow taken—the priesthood embraced—he usually chose the comrades of his pleasures from those whom he had made his victims, partly because he thus secured to himself their secresy, partly because he thus yet more confirmed to himself his peculiar power. Hence the motives of his conduct to Apœcides, strengthened as these were, in that instance, by his passion for Ione."

The progress of the calamity that overwhelmed Pompeii is thus sketched (chiefly from Pliny) by Mr. Bulwer. The fault of the picture is the strained exaggerations of that, which rhetorical efforts rather degrade than aggrandise.

"In the pauses of the showers, you heard the rumbling of the earth beneath, and the groaning waves of the tortured sea; or, lower still, and audible to the watch of intensest fear, the grinding and hissing murmur of the escaping gases through the chasms of the distant mountain. Sometimes the cloud appeared to break from its solid mass, and, by the lightning, to assume quaint and vast mimicries of human or of monster shapes, striding across the gloom, hurtling one upon the other, and vanishing swiftly into the turbulent abyss of shade; so that, to the eyes and fancies of the affrighted wanderers, the unsubstantial vapours were as the bodily forms of gigantic foes,—the agents of terror and of death.

"The ashes in many places were already knee-deep; and the boiling showers which came from the steaming breath of the volcano forced their way into the houses, bearing with them a strong and suffocating vapour. In some places, immense fragments of rock, hurled upon the house-roofs, bore down along the streets masses of confused ruin, which yet more and more, with every hour, obstructed the way; and, as the day advanced, the motion of the earth was more sensibly felt—the footing seemed to slide and creep—nor could chariot or litter be kept steady, even on the most level ground.

"Sometimes the huger stones, striking against each other as they fell, broke into countless fragments, emitting sparks of fire which caught whatever was combustible within their reach; and along the plains beyond the city the darkness was now terribly relieved; for several houses, and even vineyards, had been set in flames; and at various intervals the fires rose sullenly and fiercely against the solid gloom. To add to this partial relief of the darkness, the citizens had, here and there, in the more public places, such as the porticoes of temples, and the entrances to the forum, endeavoured to place rows of torches; but these rarely continued long; the showers and the winds extinguished them, and the sudden darkness into which their sudden birth was converted, had something in it doubly terrible and doubly impressing on the impotence of human hopes—the lesson of despair.

"Frequently, by the momentary light of these torches, parties of fugitives encountered each other, some hurrying towards the sea, others flying from the sea back to the land; for the ocean had retreated rapidly from the shore—an utter darkness lay over it, and, upon its groaning and tossing waves, the storm of cinders and rock fell without the protection which the streets and roofs afford-

ed to the land. Wild—haggard—ghastly with supernatural fears, these groups encountered each other, but without the leisure to speak, to consult, to advise; for the showers fell now frequently, though not continuously, extinguishing the lights which showed to each band the death-like faces of the other, and hurrying all to seek refuge beneath the nearest shelter. The whole elements of civilisation were broken up. Ever and anon, by the flickering lights, you saw the thief hastening by the most solemn authorities of the law, laden with, and fearfully chuckling over, the produce of his sudden gains. If, in the darkness, wife was separated from husband, or parent from child, vain was the hope of reunion. Each hurried blindly and confusedly on. Nothing in all the various and complicated machinery of social life was left, save the primal law of self-preservation!"

It seldom happens that in modern novels we do not track the antecedent march of Sir Walter Scott. The witch of Vesuvius is of the Meg Merrilies family, but of a gloomier complexion. Ione, however, is the personage on whom the author has prodigally lavished his most embellished descriptions. She is a Corinna, and was probably sketched under the domineering influence of that type, left us by Madame de Stael, of loveliness and genius.

"Ione knew her genius, but, with that charming versatility that belongs of right to women, she had the faculty, so few of a kindred genius in the less malleable sex can claim,—the faculty to bend and model her graceful intellect to all whom it encountered. The sparkling fountain threw its waters alike upon the strand, the cavern, and the flowers; it refreshed, it smiled, it dazzled every where. That pride, which is the necessary result of superiority, she wore easily—in her breast it concentred itself in independence. She pursued thus her own bright and solitary path. She asked no aged matron to direct and guide her—she walked alone by the torch of her own unflickering purity. She obeyed no tyrannical and absolute custom. She moulded custom to her own will, but this so delicately, and with so feminine a grace, so perfect an exemption from error, that you could not say she *outraged* custom, but *commanded* it. It was possible not to love Ione; perhaps she seemed too high for the love of vulgar natures; but if you did once love her, it was to adoration. The wealth of her graces was inexhaustible—she beautified the commonest action; a word, a look, from her seemed magic. Love her, and you entered into a new world; you passed from this trite and common-place earth; you were in a land in which your eyes saw every thing through an enchanted medium. In her presence you felt as if listening to exquisite music; you were steeped in that sentiment which has so little of earth in it, and which music so well inspires—that intoxication which refines and exalts, which seizes, it is true, the senses, but gives them the character of the soul."

And here, without attempting an analysis of the tale, we close our extracts. Like Lord Byron, Mr. Bulwer skilfully works the bright and felicitous expressions of other writers (such as Jeremy Taylor and Volney) into his own style, where they shine to advantage, like gems fashionably reset. A trivial error occurs occasionally in the latinity, with which the dialogue is sometimes interspersed. "*Chare caput!*" a familiar address,* like the φιλη κεφαλη of the Greeks, if *caput* is a neuter noun, as it formerly was, should have been *charum caput*. "*Per Jove, per Hercule,*" are not correct forms of Roman adjuration. But these are criticisms so minute that we feel disposed to recall them. They are the shoemaker's commentary on the picture of Apelles.

* We are not satisfied that the Romans ever employed the phrase in this manner. *Caput* is used by classical authors in the sense of "person," as where Horace speaks of Virgil as *tam carum caput*.

From the Nautical Magazine.

CONCH DIVERS OF THE BAHAMAS.

In December, 1821, one of his majesty's ships, in going into the harbour of New Providence, struck on a bank, and rubbed off a sheet or two of her copper. The following morning, one of the divers being sent for, and supplied with hammer, nails, and sheets of copper, sunk himself to the keel, and, after two or three breathings at the surface of the water, made good the defects! He was afterwards required by the commanding officer to bend a hawser on to the chain cable near the anchor, as it lay at the bottom in nearly four fathoms water. This he accomplished with much ease, and a seaman-like bend it proved on the anchor being hove up. These divers, who are black men, and generally natives of the outer islands, are nearly six feet in height, with broad shoulders, and so accustomed to diving for conchs from their infancy, in from two to ten fathoms water, that they have habituated themselves to continue under water for as long a time, perhaps, as the pearl divers of India. They often take with them a hammer, and on finding a conch, will break his shell, take out the fish, and prepare it for dressing before they rise; they will also take a bottle of any drinkable liquid, with the cork wired, and sink to the bottom in three or four fathoms, and, with a corkscrew, draw the cork, drink its contents, and rise with the empty bottle! Porter is always the beverage they solicit on these occasions.

From the Oriental Annual.

TRANSLATION OF AN ODE FROM HAFIZ.

BY THE LATE SIR JOHN MALCOLM.

Gay rose, fresh gemm'd with morning dew,
Go waste thy fragrance sweet in air;
Thou gladd'st not me, unless I view
Her cheek, who wont thy bloom to share.

Till wine, the social circle round,
The sons of mirth and joy shall bring,
Though every mead 's with verdure crown'd,
I hail not the returning spring.

When bowers are fann'd by breezes mild,
'Tis sweet beneath their shade to stray;
But sweeter far, when warblers wild
Melodious sing from every spray.

The graceful cypress waves its head,
A thousand roses deck the grove:
But I to Nature's charms am dead,
When absent from the fair I love.

From Fraser's Magazine.

Memoirs of the Life and Correspondence of Mrs. Hannah More. By William Roberts, Esq. 4 vols. small 8vo. London, 1834. Seeley & Burnside.

At this time of day, to set about a regular critique of Mrs. Hannah More's genius and character, as displayed either in her conduct or her works, would be about the most absurd of labours. Not only has the public thoroughly made up its mind on her—and hers; but, as her biographer states, "her history and her character, in great part, belong to and represent an age, the form and pressure of which have of late been rapidly disappearing, to give place to a new order of things, and a very different system of manners; whether better or worse may be variously affirmed, —in some points probably better, in others not so good—but certainly very differently constituted, and disclosing very different tendencies." All this is good reason for writing memoirs of the lady, but bad for writing a critique—we mean a regular critique—on her productions.

It would be highly improper in us to bear down upon the memory of Mrs. Hannah More with the accumulated power which time merely has given us over it; not only would it deprive us of extracting whatever good was to be got out of the volumes now published, but would preclude us from deriving any pleasure from our task, or communicating any to the reader. Moreover, there may be intellects that are individually in a state to receive instruction and amusement from their contents, and may even yet take a warm concern in the works and the remembrance of the authoress, although the general mind, or rather the mind of those who now occupy the same relative station that such persons as herself in her own day held, be considerably in advance of her perfections.

Her biographer seems to think that the "new era" in which we find ourselves is one "of extremes;" and that "there was a happy balance in the qualities of this gifted lady," which kept her from every thing that could be so qualified. He has well enough here, though probably without design, hit off the character of her tendencies and talents.

Hannah More (the youngest but one of the five daughters of Jacob More, who was descended from a respectable family at Harleston, in Norfolk,) was born in the year 1745, in the parish of Stapleton, in the county of Gloucester. We cannot follow her through the period of childhood, concerning which the life-writer has given us certain tales of precocity, all very well in their way, but nothing out of it. Having learned something of Greek and Roman history from her father, something of the Latin and French languages, and the mathematics, we find her in a boarding-school at Bristol, under her eldest sister's care, reading the *Spectator*, and hearing the elder Sheridan lecture on eloquence, and writing verses on Sheridan's said lectures, and other matters of like grave import. Ferguson, the popular astronomer, also, was engaged in lecturing at Bristol; with him she formed an acquaintance, as also with one Peach, a linen-draper, to whom the historian, Hume, had entrusted the correction of his history, and who had detected in it more than two hundred Scoticisms. "But for this man, it appears, two years of the life of the historian might have passed into oblivion which were spent in a merchant's counting-house in Bristol; whence he was dismissed, on account of the promptitude of his pen in the correction of the letters entrusted to him to copy. More than twenty years after the death of Mr. Peach, the subject of these memoirs, being in company with Dr. Percy, then Bishop of Dromore, Mr. Gibbon, Sir Joshua Reynolds, and others, who were conjecturing what might have been the cause of this chasm of two years in the life of Hume, (of which the bishop was then proposing to give a sketch,) she was enabled to clear up the mystery by relating the above anecdote. As the intended life did not appear, she never knew what use the bishop made of her communication."

In 1762, Hannah More appeared as an authoress, in the pastoral drama entitled *The Search after Happiness*, which she proposed for private performance by young ladies, instead of the regular drama, which contains passages improper for their recital. At Weston-super-mare, whither the lady retired for the benefit of her health, she formed and kept up an acquaintance with the celebrated Dr. Langhorne, until his intemperance suspended it. Two specimens of his correspondence are preserved,—they are lively but need not be quoted. At the age of twenty, having access to the best libraries in her neighbourhood, Miss More cultivated the Italian, Latin, and Spanish, imitating or translating Horace and Metastasio. Metastasio's opera of *Regulus* she worked up into *The Inflexible Captive*, a drama. Dean Tucker, Dr. Ford, and Dr. Stonehouse, were among her friends; and the last was her guide in divinity.

At the age of 22, Mr. Turner, a gentleman of fortune, proposed for Hannah More's hand. As she was young and dependent, she quitted her interest in the concern of the school, and was at great expense in preparing and fitting herself out to be the wife of a man of great wealth. The day was fixed more than once for the marriage, and Mr. Turner each time postponed it. Her sisters and friends interfered, and would not permit her to be so treated and trifled with. Sir James Stonehouse was applied to, and interposed. The final separation was amicably agreed upon, and the contracting parties broke off their intercourse by mutual consent. Mr. Turner was desirous of settling an anuuity upon her; she declined; but in a conversation with Dr. Stonehouse, that gentleman succeeded in inducing the doctor to become trustee and agent for a part of the annual sum intended. But it was not until some time after this affair had been thus concluded that the consent of Miss More could be obtained, even by the importunity of her friends. The regard and respect of Mr. Turner for Miss More was continued through his life; and at his death he bequeathed her a thousand pounds.

This event made her resolve on single blessedness; and although solicited again, she still

refused her hand; and, as it happened in the former case, the attachment of the proposer was succeeded by a cordial respect, which was met on her part by a corresponding sentiment, and which ended only with his existence.

Miss More's talents had hitherto been of a dramatic sort, and she was desirous of hearing Garrick speak Shakspeare. Her first letter is upon the subject of Sheridan's *Rivals*, and its first reception, which was unsuccessful. In another letter, Hampton Court throws her into raptures. Pope's house and grotto, however, had to her very little merit, "but that they once belonged to one of the greatest poets upon earth." It was in 1773 or 1774, that Hannah More, in company with two of her sisters, visited London; and her introduction to Mr. and Mrs. Garrick took place in about a week after her arrival. Garrick had seen a letter from Miss More to a person known to them both, so well describing the effect produced upon her mind by his performance of the character of *Lear*, as to inflame his curiosity to see and converse with her. At his house she met Mrs. Montagu. To Dr. Johnson she was introduced at Sir Joshua Reynolds's, who prepared her, as he handed her up stairs, for the possibility of his being in one of his moods of sadness and silence. It was, however, otherwise with the moralist; he met her with good humour in his countenance and a macaw in his hand, accosting her with a verse from a morning hymn which she had written at the desire of Sir James Stonehouse. She was next introduced to Baretti, Edmund Burke, Dr. Percy, and Mrs. Williams (Dr. Johnson's well-known blind poetess).

"I forgot to mention," says one of her sisters, in a letter to the family at home, "that not finding Johnson in his little parlour when we came in, Hannah seated herself in his great chair, hoping to catch a little ray of his genius: when he heard it he laughed heartily, and told her it was a chair on which he never sat. He said it reminded him of Boswell and himself, when they slept a night at the spot (as they imagined) where the weird sisters appeared to Macbeth: the idea so worked upon their enthusiasm, that it quite deprived them of rest. However, they learnt the next morning, to their mortification, that they had been deceived, and were quite in another part of the country."

Hannah More, it seems, eschewed the vanity of writing *good* letters. It was her opinion that "letters among near relations were family newspapers, meant to convey paragraphs of intelligence, and advertisements of projects, and not sentimental essays." This is vivacious; so is the following:—

"We have been reading a treatise on the morality of Shakspeare; it is a happy and easy way of filling a book that the present race of authors have arrived at—that of criticising the works of some eminent poet, with monstrous extracts and short remarks. It is a species of cookery I begin to grow tired of. They cut up their authors into chops, and by adding a little crumbled bread of their own, and tossing it up a little, they present it as a fresh dish: you are to dine upon the poet; the critic supplies the garnish, yet has the credit as well as profit of the whole entertainment."

Induced by the attention paid to her in London, she determined to try what was her real value, by writing a slight poem, and offering it to Cadell. *Sir Eldred of the Bower* was thus produced, to which she added the little poem of the *Bleeding Rock*, which she had written some years previously. She succeeded; and so commenced her connection, continued for forty years, with the house of that respectable publisher.

Her acquaintance with Dr. Johnson was so characterised by mutual tenderness, that it was the subject of many pleasant witticisms with Mrs. Montagu. Allusion to this, and even to the early circumstances of the family, is made in the following humorous letter from one of her sisters:—

"If a wedding should take place before our return, don't be surprised,—between the mother of Sir Eldred and the father of my much-loved Irene; nay, Mrs. Montagu says, if tender words are the precursors of connubial engagements, we may expect great things: for it is nothing but 'child,' 'little fool,' 'love,' and 'dearest.' After much critical discourse he turns round to me, and with one of the most amiable looks, which must be seen to form the least idea of it, he says, 'I have heard that you are engaged in the useful and honourable employment of teaching young ladies.' Upon which, with all the same ease, familiarity, and confidence we should have done, had only our own dear Dr. Stonehouse been present, we entered upon the history of our birth, parentage, and education; showing how we were born with more desires than guineas; and how, as years increased our appetites, the cupboard at home began to grow too small to gratify them; and how, with a bottle of water, a bed, and a blanket, we set out to seek our fortunes; and how we found a great house, with nothing in it; and how it was like to remain so, till, looking into our knowledge-boxes, we happened to find a little *larning*, a good thing when land is gone, or rather none: and so at last, by giving a little of this little *larning* to those who had less, we got a good store of gold in return. But how, alas! we wanted the wit to keep it! 'I love you both!' cried the enamorato; 'I love you all five! I never was at Bristol: I will come on purpose to see you. What! five women live happily together! I will come and see you. I have spent a happy evening—I am glad I came—God for ever bless you! you live lives to shame duchesses.' He took his leave with so much warmth and tenderness, we were quite affected at his manner.

"If Hannah's head stands proof against all the adulation and kindness of the great folks here, why then I will venture to say, nothing of this kind will hurt her hereafter. A literary anecdote:—Mrs. Medalle (Sterne's daughter) sent to all the correspondents of her deceased father, begging the letters which he had written to them; among other wits, she sent to Wilkes, with the same request. He sent for answer, that as there happened to be nothing extraordinary in those he had received, he had burnt or lost them. On which, the faithful editor of her father's works sent back to say, that if Mr. Wilkes would be so good as to write a few letters in imitation of her father's style, it would do just as well, and she would insert them. Two carriages at the door—Mrs. Roscawen, and Sir Joshua; the latter to take us to an auction of pictures; the former paid a short visit, that she might not break in upon our engagements. Dr. Johnson and Hannah last night had a violent quarrel, till at length laughter ran so high on all sides, that argument was confounded in noise: the gallant youth, at one in the morning, set us down at our lodgings."

The effect upon her of Garrick's reading her own *Sir Eldred* is interesting.

"I'll tell you the most ridiculous circumstance in the world. After dinner, Garrick took up the *Monthly*

Review (civil gentlemen, by the by, these Monthly Reviewers), and read 'Sir Eldred' with all his pathos and all his graces. I think I never was so ashamed in my life; but he read it so superlatively, that I cried like a child. Only think, what a scandalous thing to cry at the reading of one's own poetry! I could have beaten myself; for it looked as if I thought it very moving, which, I can truly say, is far from being the case. But the beauty of the jest lies in this: Mrs. Garrick twinkled as well as I, and made as many apologies for crying at her husband's reading, as I did for crying at my own verses. She got out of the scrape by pretending she was touched at the story, and I, by saying the same thing of the reading. It furnished us with a great laugh at the catastrophe, when it would really have been decent to have been a little sorrowful."

London society had warnings in sudden deaths, and similar omens, for the minds of the serious Hannah; and she was evidently beginning to shrink from the contact of the common world, and find another kind of happiness in one more religious. Saurin's *Sermons* seem to have excited her admiration, and, sooth to say, deservedly. We recollect ourselves the time we first read them,—even as we do our first perusal of Schiller's *Robbers;* they are equally impressive —each sublime in their way, and the sublime in both is of the material rather than the spiritual.

Miss More was present at the trial of the Duchess of Kingston, and describes it well; equally well she describes Garrick in the character of *Hamlet*. The leading passion of the princely Dane she takes to be filial love. She saw Garrick in all the characters with which he finally took his leave of the stage. Her letter to him from the country is an elaborate compliment, and is one of the sort that she usually avoided,—it is a good one.

In one of her letters she complains of morning headaches precluding early rising; but then she sat up later than the family she was staying with, reading through Dr. Maclaine's answer to Soame Jenyns. But it seems she was subject to successive illnesses,—evils these which she converted into blessings; for, independently of the prime benefit of cheapening life, and teaching patience, they induced a habit of industry not natural to her, and taught her to make the most of her *well* days. She laughingly added, it had taught her also to contrive employment for her sick ones; that from habit she had learned to suit her occupations to every gradation of the measure of capacity she possessed. "I never," she said, "afford a moment of a healthy day to transcribe, or put stops, or cross t's, or dot my i's; so that I find the lowest stage of my understanding may be turned to some account, and save better days for better things. I have learned from it also to avoid procrastinations, and that idleness which often attends unbroken health."

Allusions are made in Garrick's letters to Miss More's tragedy of *Percy*, then in progress. In November of the year 1777, it was completed, and accepted by Mr. Harris of Covent Garden, to be brought out without delay. Garrick interested himself much about this play, wrote for it the prologue and epilogue, which in performance were received with plaudits, and the play succeeded. All the correspondence about this tragedy is couched in the highest terms of applause; all is flushed with success. Mrs. Boscawen even goes the length of composing a wreath of Roman laurel, ingeniously interwoven, and the stems confined within an elegant ring, which she accompanied with an "elegant *morceau*" of a letter, as a present to the fair muse of tragedy. The gift was acknowledged in some pretty verses. Home, the author of *Douglas*, was also introduced to her on this occasion. Garrick read the play to a party at Lord Spencer's, and four thousand copies of it were sold in the first fortnight. Mr. Mackenzie also writes high flattery on this subject. She profited six hundred pounds by the performance and sale of the copyright, which Garrick laid out for her on good security at five per cent. Criticism on this drama would be worse than wasted at this time of day: it might be characterised as a *technical* tragedy; the dagger and the bowl are both produced on the stage; nothing is wanted but the presence of the Muse herself to complete the effect of the design.

We wish we had room to extract Hannah More's account of the death of Garrick, and her testimony to the correctness of his conduct in his own house; it is worth all the books she has ever written. Here is at any rate the truth of fact; and the fact is one to remove many prejudices which her more serious labours are calculated to foster. But still superior to her letter is that of Mrs. Montagu on the same occasion: no sectarian taint spoils a single sentiment or expression; but all is catholic, and worthy of the fair essayist on Shakspeare.

The death of Garrick having lessened Hannah More's interest with the stage, she did well to turn her mind to other channels of intellectual exertion. She claims, however, too much merit for the act. Five years she took in disconnecting herself from fashionable society, ere she retreated to Cowslip Green. Before she gave up the theatre, she tried her fate again in another venture, *The Fatal Falsehood*, of which four acts had been read by Garrick before his death, and the completion of which, we are told, was hurried in consequence of Mr. Harris's importunity. Being brought out at an unfavourable season, it had not so great a run as the *Percy;* nevertheless, it succeeded.

Hannah More was a believer in the authenticity of Rowley's poems, and could not be for some time convinced either by the authority or the reasonings of Johnson and Percy. This fact shows the state of her taste at the time. Equally conventional were her feelings; *e. g.* thus she writes to one of her sisters, from Hampton, in 1780. "I would wish you a merry Christmas, as well as happy new year, but that I hate the word merry so applied: it is a fitter epithet for a *Bacchanalian* than a *Christian* festival, and seems an apology for idle mirth and injurious excess." She fails here to perceive that the *Bacchanalian* was also religious; or, if not, her mind is not of that catholic capacity to esteem it for what it was. Nay, she could as little love nature in *all* her moods as she could mind in all its forms. "What frost, what snow!" she exclaims. "By the by, if this same snow were of human invention, I should be

apt to say I did not like it. Yet the vast expanse of glistening white on the ground, the fluid brilliants dropping from the trees, and the greenhouse full of beautiful blossoms and oranges, make it altogether like some region of enchantment; *and as the gravel walks are all swept clean*, I parade an hour or two every morning." This is capital! It is soothing, however, to think that a wintry morning might please Miss Hannah More, provided the *gravel walks were all swept clean*. Poor nature!

She seems to have been much better pleased with some Latin verses in her praise, written by Bishop Lowth. She alludes to them in numberless letters,—always making a great show of keeping them back, yet always bringing them forward. "Mrs. Boscawen threw me into no small confusion; she got among the men, not less than twenty, all *beaux esprits*, and gave them all, privately, Bishop Lowth's verses to read." *Finesse!* Who can doubt it? The *Sacred Dramas* and the poem of *Sensibility* seem to have much interested the bishop; and, as specimens of artificial poetry, it must be acknowledged they are creditable compositions.

Mrs. Macauley was one of Hannah More's acquaintances. She, however, had a terrible fall in her good graces. In a letter from Bath, dated Dec. 23, we have these complainings. "I feel myself extremely scandalised at her conduct, and yet I did not esteem her. I knew her to be absurd, vain, and affected, but never could have suspected her of the indecent, and, I am sorry to say, profligate turn which her late actions and letters have betrayed. The men do so rejoice and so exult, that it is really provoking; yet have they no real cause for triumph; for this woman is far from being any criterion by which to judge of the whole sex: she was not feminine either in her writings or manners; she was only a good, clever man. Did I never tell you, my dear madam, an answer her daughter once made me? Desirous, from civility, to take some notice of her, and finding she was reading Shakspeare, I asked her if she was not delighted with many parts of *King John*? 'I never read the *kings*, ma'am,' was the truly characteristic reply." How these poles ever came to coalesce is a mystery!

The verses entitled *Bas Bleu* are the subject of much correspondence. About this time Miss More was elected a member of the French Academy.

Her patronage of the poetical milk-woman, Mrs. Yearsly, is an instructive chapter in the history of patronage. Though poor, the poetess did not like to be so called in a printed preface; besides, she wanted the entire control of the money raised for her benefit. Her pride rebelled against her gratitude: and she circulated slanders against her benefactress, or rather spoke them to her face, accusing her of envy, and of a design to defraud her or her children of the amount of the subscriptions. Miss More's share in this transaction is much to her credit. She thus writes on it: "Had she turned out well, I should have had my *reward*; as it is, I have my *trial*. Perhaps I was too vain of my success; and in counting over the money (almost 500*l.*) might be elated, and think, Is not this great Babylon that I have built? Prosperity is a great trial, and she could not stand it. I was afraid it would turn her *head*; but I did not expect it would harden her *heart*. I continue to take the same care of her pecuniary interests, and am bringing out a second edition of her poems. My conscience tells me I ought not to give up my trust for these poor children on account of their mother's wickedness. You know Mrs. Montagu and I are joint trustees for the money." Two years afterwards this woman brought out, unassisted, another book, which she advertised to be free from Hannah More's "corruptions." She, however, prefixed to it the original preface to the first book, and twenty pages of the scurrility published in a second. To all which she added a deed, which Miss More got drawn by an eminent lawyer, to secure her money in the funds; and which she asserted Miss More made Mrs. Montagu sign without reading. Mrs. Yearsly had, however, gained her point, in having the money settled to her wish.

Hitherto, as we are instructed by Mr. Roberts, we have seen Hannah More in the midst of certain disturbing influences, which weaned her from a religious predisposition, often enough visible in the course of her correspondence. But now, retired to Cowslip Green, there are hopes of the revival of those thoughts which by a fashionable life had been dissipated. Previous to her finally settling there, however, we have a mass of correspondence about Mrs. Piozzi and Boswell, and their respective biographies of Johnson. The passages in Mrs. Piozzi's book, which were unkind to Garrick, filled her with indignation. If Johnson had been envious enough to utter them, our author thought Mrs. Piozzi might have been prudent enough to suppress them. "Johnson," she continues, "with all his genius, had no taste for Garrick's acting, and, with all his virtues, was envious of his riches: this led him very unjustly to say severe things, which Garrick not unfrequently related. But why must these things be recorded? The speaker, perhaps, had forgotten them, or was sorry for them, or did not mean them; but this new-fashioned biography seems to value itself upon perpetrating every thing that is injurious and detracting. I perfectly recollect," adds Hannah More, "the candid answer Garrick once made to my enquiry, why Johnson was so often harsh and unkind in his speeches, both of and to him. 'Why, Nine,' he replied, 'it is very natural; is it not to be expected he should be angry, that I, who have so much less merit than he, should have had so much greater success?'"

Up to December of the year 1786, no account exists of the manner in which Hannah More spent her time at Cowslip Green; probably, says her biographer, she lived in great retirement, pursuing her gardening occupations: but in the said month of December she visited Mrs. Garrick again, whom she found well, and went with her the round of society as usual. Against this fashionable mode of wasting time, however, she now took care to issue her manifesto, in a little work entitled *Thoughts on the Manners of the Great*. We feel, nevertheless, more interested now in her thoughts on her own way of life at

Cowslip Green. The amount of false sentiment in these is prodigious. She separates her religious duties from the active engagements of life; a fatal error, which has led to the abstraction and mysticism of nunneries and monasteries, and their consequent *vices*. In tending of flowers, and even in paying visits, devotion may mingle; and if admiration of the works of God and charity to our neighbours be the concomitants of either act, more religion will belong to it than to all the *leisure* in the world. When we are in society, or among cultivated objects, whether of nature or art, we know our company; but when we are alone, as Sir Thomas Browne somewhere justly remarks, we have most often the devil for our familiar. The Rev. John Newton's letter, in reply to the one on which we have commented, is very valuable; but our space will not permit its insertion. This gentleman's letters have all of them much merit.

With her *Thoughts on the Importance of the Manners of the Great to General Society*, which met with extraordinary success, an era begun in the life of Hannah More. This book was published anonymously; not from fear of man, she said, "but because it might be ascribed to some better person." She confesses that the work was superficial, being fitted for an audience similarly qualified, and confined to prevailing practical evils. Another time she proposed to herself to attack more strongly the *principle*. About the same period appeared her poem on *Slavery*, to which her name was attached.

One of the smartest things that we have observed in these letters, is an observation excited by her witnessing the trial of Hastings.

"I was over-persuaded by Lord and Lady Amherst to go to the trial, and heard Burke's famous oration of three hours and a quarter without intermission. Such a splendid and powerful oration I never heard, but it was abusive and vehement beyond all conception. Poor Hastings sitting by, and looking so meek to hear himself called *villain* and *cut-throat!* &c. The recapitulation of the dreadful cruelties in India was worked up to the highest pitch of eloquence and passion, so that the orator was seized with a spasm which made him incapable of speaking another word; and I did not know whether he might not have died in the exertion of his powers, like Chatham. I think I never felt such indignation as when Burke, with Sheridan standing on one side and Fox on the other, said, 'Vice incapacitates a man from all public duty; it withers the powers of his understanding, and makes his mind paralytic.' I looked at his two neighbours, and saw they were quite free from any symptoms of palsy."

Her remarks on Gibbon are equally acute.

About this time she wrote her poem of *Bonner's Ghost*, to which Walpole paid the honour of having it printed at the Strawberry press, with the stamp and impress, in an engraving, of Strawberry Hill.

At the close of the year 1789, Hannah More was enabled to withdraw from general society, her sisters having made their fortunes, and herself being in a thriving course. Previously to their taking this step, Miss More and her three sisters had built for themselves a house in Great Pulteney Street, Bath; and between this residence of their own, and the retreat at Cowslip Green, they were in future to divide their time. It is mentioned as a singular circumstance, that all the four houses in which they resided were built by themselves; and in not one of them had death disturbed their happy union, till, at the end of fifty years, they lost their eldest sister. They occupied their time principally in instructing the poor children of Cheddar, a village distant ten miles from Cowslip Green, and collected a school of nearly three hundred children. To this school the correspondence about this period relates. The state of both clergy and laity, aristocracy and populace, in this place, had grown to rankness; and, in so employing herself, she was doing more good, certainly, than in tending flowers, paying visits, or indulging *leisure*. She found time, also, to produce her *Estimate of the Religion of the Fashionable World*. This book had a large sale.

In 1791, the sisters having extended their plan of operation, the number of children under their instruction exceeded twelve hundred. Her visits to London, accordingly, were more contracted; and when there, her time was occupied in vain endeavours to rescue a young heiress, who had been trepanned away from school at the age of fourteen.

At the political crisis of 1792, Hannah More was called upon from all quarters to send forth some little work as an antidote to the revolutionary principles then so fearfully spreading. This she openly declined; but, in secret, caused Mr. Rivington to publish a dialogue of *Village Politics, By Will Chip*, which was extensively circulated.

At the latter end of the second volume we have some extracts from Hannah More's Journal (1794) concerning her spiritual state, from which we find that she had not allowed herself to read any classic or pagan author for many years—by herself—having chosen for private perusal serious and religious books. Clear enough from this diary it is, that she had parted for ever with elegant literature; and that little more was now to be expected from her than longer or shorter tracts on matters religious or political. To undersell similar publications that were disseminated in the cause of infidelity and rebellion, she promoted a subscription, in which she was well supported; and two millions of tracts were sold in one year. They were afterwards collected into three volumes. In the *Cheap Repository* (for such was the title), she received assistance from the pens of others,—one her own sister, and one the poet Mason.

The following reflections on the death of Lord Orford are characteristic of the writer. Thus writes Hannah More to her sister Martha, from London, 1787:

"Poor Lord Orford! I could not help mourning for him, as if I had not expected it. But twenty years' unclouded kindness and pleasant correspondence cannot be given up without emotion. I am not sorry now that I never flinched from any of his ridicule or attacks, or suffered them to pass without rebuke. At our last meeting, I made him promise to buy Law's *Serious Call*. His playful wit, his various knowledge, his polished manners, alas! what avail they now! The most serious thoughts are awakened. Oh, that he had known and

believed the things that belonged to his peace! My heart is much oppressed with the reflection."

It is strange that people of Hannah More's turn of mind should always entertain such very charitable thoughts of their acquaintance in the article of death. Amiable they may be; but because they take not up with a certain form of speech and demeanour, their after-state is always presumed in the most unfavourable manner. There is in this a temper and feeling which religious people should avoid. Take our word for it, it is an infirmity; and was in Hannah More. There was, however, much of profane in the character of Lord Orford: yet, even in extreme cases, the rule is a good one—"Judge not, lest thou be judged."

From a letter addressed to Mr. Wilberforce, we find that in the month of August, 1798, Hannah More was very seriously ill indeed.

"I was attacked," she writes, "with one of my violent spasms in my head, on the Saturday night, so that I could not go with the Dykes the Sunday round; but Patty did. This pain continued almost intolerable during two days and two nights, and left my nerves in a high state of irritation. On Monday, being alone, I fell down from the place where I was sitting, in a fainting fit. I dashed my face against the corner of a stone wall, and lay a very long time without giving any signs of life. My sisters found me in a posture which must soon have suffocated me, with my face frightfully disfigured, and the floor sprinkled with blood. There was a strong contest between life and death, but it pleased my merciful God to raise me up. I was a good while before I had any clear ideas, but felt a sort of stupid serenity, no emotion, but a general feeling that I had not done enough for God; and what would poor Patty do by herself? I am so disfigured, you would scarcely know me; but I am full of gratitude: for though my eyes make me look a perfect Mrs. Mendoza, yet the sight is safe; and had not my face received the bruises, my skull must have been fractured. You will be glad to hear that my mind has been very calm, and that I felt that this visitation was in mercy. I write this two or three lines at a time, and cannot see to read it; but the bruises, though very bad, are nothing—they will in time disappear; but I must try to get my nerves in a better way. I have a dull pain in my head, which is very unpleasant. I must tell you that we have kept possession of the pulpit at Wedmore ever since, and sent one of our own clergy every Sunday, to keep up the attention to our plan. Last Sunday, Drewitt preached an hour; after he had finished, the clerk got up and said, 'the parish are desired to meet next Friday, to consult on the best means of opposing the ladies who are coming to set up a school.'

"Bold Drewitt, nothing dismayed, stood up instantly in the pulpit, and said, 'and on Sunday next the parish are desired to meet the ladies, who intend opening the school at nine o'clock:' but I now doubt if I shall be able. It will be a hard-run contest; and whether John Barrow or Hannah More will be the successful candidate, I have not the least idea."

In the following year appeared her *Strictures on Female Education*—her third ethical publication in prose, says her biographer; who adds (though in a style of composition which is excessively faulty), "and one of the most powerful pieces of her artillery, from whose calibre were shot those bolts which shattered the towers and arsenals of fashionable abuses and follies." A letter from Mr. Charles Burney on this work deserves quotation, but our space forbids it.

In the promotion of infant schools, and in the institution of female friendly societies, Hannah More and her sister Martha spent two valuable years, subduing opposition and overcoming difficulties. Mr. Bere, the curate of Blagdon, the parish in which Cowslip Green was situated, waited on the sisters, to request they would open one of their schools in his parish; and, upon their at first declining, was seconded by the churchwarden and overseers in his application. After their consent, however, the same curate became afraid of some tendency to methodism in their proceedings; and they suffered in their exertions from suspicion of disaffection to church and state, and the imputation of fanaticism. As a defence against this charge, her biographer publishes a letter from her to a young curate; but we are afraid that the curate of Blagdon would have quoted it in evidence. Nevertheless, we hold it to be highly creditable to the authoress. Through all the attacks, however, which she experienced, we are told, she preserved the dignity of silence; and when advised by Lord Chancellor Loughborough to prosecute the author of a scandalous pamphlet against her, she declared her resolution never, upon any provocation, to embark either in controversy or litigation. With regard to this same Lord Chancellor Loughborough we are told, in a note, that she was induced at different periods of her life to apply to his lordship in behalf of two clergymen of great merit, who were unprovided for, and that her request was on each occasion immediately granted. In the latter instance, the presentation was sent directly to herself, that she might have the pleasure of conveying it with her own hands to the friend for whom she had interested herself.

Mrs. More was sinking under an attack of ague at the time of her persecution, and relinquished the school at Blagdon; having given, in a letter to Dr. Beadon, the bishop of Bath and Wells, as her diocesan, a clear exposition of the whole controversy.

In this letter she effectually defends herself from any affection for conventicles. "Had I been irregular," she asks, "should I not have gone sometimes, during my winter residence at Bath, to Lady Huntingdon's chapel, a place of great occasional resort? Should I never have gone to some of Whitfield's or Wesley's tabernacles in London, where I have spent a long spring for near thirty years? Should I not have strayed now and then into some methodist meeting in the country? Yet not one of these things have I ever done."

The sore point seems to have been the conduct of one Young the school-master. To her letter Dr. Beadon returned a gracious answer.

This episcopal sanction, however, backed as it was by that of other prelates, failed to relieve her from the attack of Bere; who went the length of hearing, as a magistrate, affidavits sworn against her and her teachers, on such grave charges as Calvinism, extemporary praying, and enthusiasm. This instigated the farmers at Wedmere, who formally presented her at the arch-

deacon's visitation, for teaching the poor without a license; and employed an attorney of bad character to annoy her. The eventful turn of affairs, however, at Blagdon, was in Mrs. More's favour. She thought right, nevertheless, to quit her residence at Cowslip Green for one which she built at Barley Wood, about a mile distant. Her sisters, too, left Bath, and shared the conveniences of her new mansion. Here they were much visited, for advice and recreation. Her celebrity occasioned her time to be much occupied in receiving and answering letters.

Her life had been for a while active; she now determined to assume the practice of composition. Of her Christianity it must be said, that it was far removed from sectarianism. In her Diary for 1803, she writes:

"*July* 8.—Have been looking at one of the answers to Overton. My very soul is sick of religious controversy. How I hate the little narrowing names of Arminian and Calvinist! Christianity is a broad basis. *Bible* Christianity is what I love; that does not insist on opinions indifferent in themselves—a Christianity practical and pure, which teaches holiness, humility, repentance, and faith in Christ; and which, after summing up all the evangelical graces, declares that the greatest of these is charity."

This passage is deserving of all praise; others, however, are liable to the objection to which so many professedly religious diaries are obvious,—namely, foolish self-condemnation for imaginary transgressions; *e. g.*

"*November* 1*st*.—Another month is begun. I have been negligent, but God has been gracious. He has multiplied his mercies, but I have been cold and dead under them. Even in writing this confession, I do it with an unfeeling, unbroken spirit. The country, though increasing in danger, has been preserved from invasion, and internal peace has been preserved. A public fast and humiliation looks like an acknowledgment of that God we have so much offended."

Why this strong wish to *feign* what she confesses she cannot feel? This is a disease of devoteeism,—an insane desire to wear a pious heart upon the sleeve for daws to peck at. Religious hypochondriasis is desiderated rather than a state of moral health; the only fear of such minds is that of being well; the unconsciousness of sickness is to them that of death. Better, surely, is a robust mind, which goes on its course rejoicing, insensible of infirmity, strong in faith,—hoping, loving with a perfect love that casts out fear.

In 1805, Mrs. More produced *Hints towards forming the Character of a young Princess!* a work written in imitation of Xenophon and Fenelon, for the benefit of the lamented Princess Charlotte of Wales. It was written, we are told, reluctantly, at the request of a dignitary of the church, while the princess was solely under female care. Upon the appointment of Dr. Fisher, bishop of Exeter, (afterwards bishop of Salisbury,) to that important office, she suspended her labour for a time from a sense of delicacy. She at length got over her scruples, by dedicating it anonymously to the good prelate himself, by whom it was kindly received and acknowledged, as from a gentleman.

That part of the correspondence which concerns the princess is of course peculiarly interesting. Mrs. Kennicott writes from Fulham (1805):

"Lady Elgin brought the princess to chapel here yesterday; she is certainly a wonderful little creature. She has taken a great liking to the bishop, and always desires to walk alone with him. Yesterday she desired to repeat a hymn to him, and repeated one of yours. I have heard some things of her lately, which lead me to believe she has a thinking mind uncommon for a child of her age. Just before I left Windsor, I had some conversation on the subject with Princess Elizabeth, and she gave opinions with regard to her education, so like some that you have given, that I could almost have thought she must have conversed with you on the topic.

"Did I tell you of the princess's soliloquy on reading the second chapter of St. Matthew? 'I think,' says she, 'Joseph ought not to have been afraid of returning into Judea, when God had told him by an angel that he might return; but I leave that to be settled by the Bishop of London and Lady Elgin.'"

This work was assailed in the *Edinburgh Review*. For this, however, the authoress was sufficiently consoled by the general estimation in which it was held. The late Princess Charlotte perused it carefully, as attested by the bishop to whose tuition she was intrusted; it was also one of the last books in her hands. It is probable that the production influenced her character, and it could not do so without benefit. The authoress, as her biographer rightly remarks, has in it presented the kingly character to our view substantially majestic. Not parading before us, in the colours and shadows of painted life, the pageant of drawing-rooms and saloons, but rising above all exterior decoration, and princely pomp, the servant of God and the shepherd of the people. She has shown, too, that attachment to the prince and obedience to the laws are parts of Christianity; and that no diadem is firm on the brow of him who depends upon an allegiance not grounded on religion, and sees not that the piety of the people is his best political friend, and the only party which it is his real interest to adopt. Her indignation sharply reproves those shallow men who are for keeping the multitude amused, at whatever cost to virtue and religion. She reminds us, that to fear God and honour the king are commandments resting upon the same authority; and that the best prince can have no permanent place in the affections of one who has no fear of God on his soul.

In the year 1806, Mrs. More was attacked by a dangerous and tedious illness, which appeared to have originated in a cold caught in returning from one of her schools. A pleuritic fever succeeded, of so inveterate a kind as for many months to resist the strongest remedies, but she bore it with remarkable composure and placidity. It was two years ere she could resume her pen, and even then her mind recovered before her body. She engaged herself in executing a scheme which had long occupied her mind, of presenting Christian principles and duties in the dress of narrative, in the colours of character, and with the breathing vivacity of dialogue and discussion. To this work a check was given by the death of Bishop Porteus, in the year 1809, who bequeathed to our authoress a legacy of 100*l*. She consecrated to his memory, in the plantation near her

house at Barley Wood, an urn, with this inscription: "To Beilby Porteus, late lord bishop of London, in memory of long and faithful friendship." The life of the bishop, by Dean Hodgson, has recorded his last visit to Carlton House, and its apostolical purpose; in relation to which it may be added, as an interesting fact, that immediately before the dying prelate set out on his holy errand, Mrs. More received a note from him, requesting her prayers for the divine blessing on the arduous and delicate task he had thought it was his duty to undertake, without further explaining his purpose; and in a few days afterwards she received a second note, and with which their earthly communication closed for ever, informing her of the success with which it had been attended.

This is a touching incident. It is thus told in a letter from Mrs. Kennicott:

"I have much satisfaction in writing to you, my dearest friend, because I think the account I have to give of our beloved bishop is such as will afford you great consolation. After his fine mind had yielded to the infirmities of his weak body, his imperfect wandering ideas still led him to exert his small remaining strength in whatever appeared to him to tend to the glory of God; and the foundation of those two distressing notes to you was a report he had heard of the institution of a club, under the patronage of the Prince of Wales, which was to meet on a Sunday. Under this impression he requested an audience of the prince, to entreat him to fix on some other day. The audience was granted. Can any thing be imagined more affecting? Supported by two servants, and hardly able to move with their assistance, he got to the apartment of the prince, and with agitated earnestness conjured him to fix on some other day for this meeting. The prince received him most graciously, seemed much affected, said it was not a new institution, and that it was founded on charity; but that if the day could be changed to Saturday it should. It was during this business that he wrote those notes to you.

"The last week was a most distressing one at the time, but now to be reflected upon with comfort. Pious zeal and true Christian humility were prevalent amidst all his rambling. On the Friday he was brought to Fulham: on entering the great hall he clasped his hands and said, 'I thank God for permitting me to come once more to this place.' The next morning he said the air refreshed him, and admired the beauty of his lawn. He was carried down to dinner, and soon after was seized with something like a convulsion; was taken to his sofa, had a cordial given to him, fell into a quiet sleep for three hours, and only just opened his eyes to close them for ever on this world. He had frequently prayed, but always with devout submission to God's will, to be spared the pangs of death; and he was spared them.

"In the drawer of the table at which he lately wrote were found various little prayers and ejaculations, written upon scraps of paper, even upon visiting-tickets—any thing which came to his hand as the pious thoughts rose in his mind.

"Our dear Mrs. Porteus does not appear to have suffered in health, and I hope will not. For every thing else we must trust to time, which our merciful Father has ordained shall soften our greatest afflictions.

"The last solemn offices were performed at Sundridge. He ordered that every thing should be done as humbly as was proper for his station. But it was impossible to keep it humble, so many of his numerous relations would attend.

"Tell me about dear Patty. How continually I think of you both in this sad house!

"My dearest friend, you know what a h our beloved bishop had of the effect of inter particularly of your prayers. This awful w me to renew the resolutions I have so often alas! so often broken, of amending my life me, that I may keep these resolutions better my former ones. The time, as you say, have now lived sixty-one years—a tremend look back upon, with so much wrong and so in the dread retrospect. Mrs. Porteus sen love.

"Yours ever most affectiona

"A. K

The work in which Mrs. More had gaged appeared anonymously in Decen in two vols. octavo, under the title of *Search of a Wife*, which in less than month ran through twelve editions.

To this work it is evident, from her c ence, that she had been induced by the Madam de Stael's *Corinne;* a characte she opposes her own Lucilla—a thorou lish person, modestly regulated by an u clarified common-sense. It is little t this work is creditable to Mrs. More's invention; it, in fact, possesses high Upon this book there is an excellent l the Rev. Joseph Berrington, the pope's neral, to which we solicit general atten More attempted to parry the thrust, but general returned to the charge, and ma good.

Mrs. More made 2000*l.* during the ye book: she compares its success with tha ter Scott's *Marmion*. Of Scott's po More did not entertain the highest opi *Lady of the Lake* she nevertheless des

"Full of beauty; the descriptive parts There is more of character and incident tha other poems. Ellen is the only woman wh ever made interesting: she is amiable, frank sant. There is also an amiable maniac, wh comes next to Richardson's 'Clementina;' s wanted, in all Scott's poetry, that without whic can cling about the heart and affections—I r admixture of moral, or rather of religious The former of these it is which makes the Beattie and of Goldsmith; and the union of b ton and Cowper captivates, while it exalts the s reader who has a soul."

In 1811, Mrs. More produced a wor volumes, entitled *Practical Piety;* the which was to exhibit Christianity as a principle, and which she endeavoured attractive by a sparkling style. This followed with one on *Christian Mora* year 1813, which was equally successfu regard to style, was an improvement o decessor. Soon after the publication of t the author's family circle was for the broken, after the sisters had lived toge years, by the death of Mrs. Mary More, t who had been some time in a declining who crowned a long life of uncommon us integrity, and benevolence, by an old age and dignified serenity, and a death ful and resignation.

Mrs. More's next work was her *Ess Character and Writings of St. Paul*, i

a task of which the accomplishment had nearly been that of her life.

"She had retired to her apartment, of which she had locked the door (a thing unusual with her) to exclude interruption, when, in reaching across the fire-place to a book-shelf, the end of her shawl caught fire behind, and, before she was conscious of the accident, had communicated it to some of her other clothes; so that when her cries had alarmed the family, they beheld her at the head of the stairs, almost enveloped in flames. The instant, however, that she perceived aid approaching, she gently retreated, with admirable presence of mind, out of the current of air into her chamber, and had the calmness and recollection to abstain from any quick motion; and to this composure and self-possession was it chiefly owing that the prompt assistance of one of her friends was successful in extinguishing the flames before her person had received any material injury."

* * * * * * * *

"The delay occasioned by this accident to the publication of her Essay on St. Paul was very trifling; the work was produced, and was accompanied by the same public curiosity and avidity which had attended all her later performances. No sooner was its coming forth announced, than the whole first edition was bespoken; and although the extraordinary events which immediately succeeded, and engrossed the public mind, were unfavourable to the circulation of any work not connected with politics, it reached a fourth edition within two years after its first appearance."

It was in the year 1815 that this work appeared. Nothing can be conceived as a greater undertaking for a religious critic, than the character and writings of the great apostle of the Gentiles. A dramatic writer characterises the Divine Founder of Christianity as "the first true gentleman that ever breathed;" and a celebrated deist gave it as his opinion, that, from the evidence of his Epistles, it was clear that Paul was a perfect gentleman. These two *dicta* we like to bring together in this place, both as fixing the character of the gentleman and the saint, and showing the possible elevation of the subject, and how it might be treated. Wisdom and knowledge were the prime attributes of this exalted man. If John the beloved disciple were the Christian Plato, Paul was the Aristotle without his errors, and with more than his eloquence. If Mrs. More's work does not precisely realise the idea which we have just indicated (and it does not, owing to *her* want of philosophy), it is still a worthy effort—a prosperous undertaking, so far as it goes.

At the close of the year 1816, Mrs. More was again employed in political pamphleteering, and ballad-mongering, against the spirit of revolution then abroad, like the schoolmaster now. In one of her letters she gives her opinion of Dr. Chalmers' astronomical sermons, which she praises for containing passages of very splendid eloquence, and for expanding one's conceptions of the infinite benevolence, as well as power, of the Supreme Being. By this divine she was visited in 1817. In the spring of this year the eldest of her surviving sisters, Miss Sarah More, died; and the loss of a vivacious conversationist must have been deeply felt by a studious mind.

A Russian princess, Metscherskey, had commenced translating several of Mrs. More's tracts into her native language. A letter from this princess is given in these volumes as a curiosity, from its broken English.

Some of her tracts had also been translated into the Cingalese and Tamul languages. Sir A. Johnstone sent her a letter, enclosing a translation of the drama of *Moses in the Bulrushes*, written on the palmyra leaf, and enclosed in a case of the wood of the country, richly painted. Her *Essay on St. Paul* was likewise translated into the same tongue. It may be mentioned here, that Mrs. More abetted with enthusiasm Mr. Wilberforce's plans for the abolition of slavery. The Hindu having taught religion and morals by means of dramatic representations, it was thought well to cater to the popular taste by a translation of Mrs. More's sacred dramas, in order to their performance.

In the autumn of 1818 Mrs. More underwent an alarming illness, in which her sister Martha could afford her no relief, as her own state was still more indicative of the closing scene. Such was their condition, that their friends determined to suspend their visits to Barley Wood—a forbearance which was beneficial to invalids in need of leisure and repose.

The authoress had now arrived at her seventy-fifth year, and, just before the publication of her work entitled *Moral Sketches*, she lost her last surviving sister. The book is principally remarkable for her exposure of Parisian society and French principles, as taught in colleges of debauchery and atheism. She was now lonely, but she found society in still continuing her walk of charity—a part of her character on which we have dwelt too little in this paper.

In the year 1819 all her patriotic tracts and ballads were collected into a pamphlet, and were found useful in repressing renewed disturbances. After this her health rapidly declined; she was unable to leave her chamber throughout the whole spring and summer of 1820. On the night of the 12th of August she was seized with an obstinate obstruction in the chest, which, however, she survived for the time. She passed tolerably well through the winter, and her conversation was still sprightly. One of her friends informed her of the rejection of the catholic-bill in the house of peers, by a majority of thirty-nine. "Then," said she, "we have beaten the Romanists with forty stripes save one." The following extract gives a specimen of the energy of this extraordinary woman:

"In the worst of my illness, Cadell wrote to entreat me to preface a new edition of *Moral Sketches* with a short tribute to our late lamented king. My friend wrote him word it was utterly impossible—that I might as well attempt to fly as to write. A week after, supposing me to be better, he again renewed his entreaty. I was not better, but worse. I fancied, however, that what was difficult might not be impossible; so having got every body out of the way, I furnished myself with pen, ink, and paper, which I concealed in my bed, and next morning in a high fever, with my pulse above a hundred, without having formed one thought, bolstered up, I began to scribble. I got on about seven pages, my hand being almost as incompetent as my head. I hid my scrawl and said not a word; while my doctor and my friend wondered at my increased debility. After a strong opiate, I next morning returned to my

task of seven pages more; and delivered my almost illegible papers to my friend, to transcribe and send away. I got well scolded; but I loved the king, and was carried through by a sort of affectionate impulse; so it stands as a preface to the seventh edition. You will be as much surprised as myself that this slight work should have made its way so rapidly in these distracted times, which, the bookseller tells me, have been the most unfavourable to literature that they have ever known. The preface is such a meagre performance as you would expect from the writer, and the strange circumstances of the writing."

In the spring of 1822, Mrs. More was suddenly seized with an inflammation of the chest, which, though severe, was subdued, with great injury to her natural strength. After many months she was restored, and, to use the words of her biographer, "seemed to view her wonderful rescue from the opening grave as an imperative call upon her to improve, with increased vigilance, every passing hour, to the temporal or spiritual benefit of her fellow-creatures." Some of her conversations about this time are given, to show how active her mind was to the last.—*e. g.*

"She remembered that when Johnson was intending to write the life of Akenside, he asked her, as a friend of Sir James Stonehouse, his contemporary at Northampton, if she could supply him with any information concerning him; upon which she made an effort to recollect some sayings she had heard reported of his, when he interrupted her with impatience: 'Incident, child! incident is what a biographer wants—did he break his leg?'

"At another time she mentioned that her friend Mrs. K——, and a little worthy knot of her neighbours, had, with the purest intentions, entered into an engagement, by which they bound themselves to do some good work every day; and that she had advised them to dissolve the contract, because, if they performed it, they might be too triumphant; and if they failed, too desponding: but still to work on in the spirit, though not in the letter, of the obligation.

"She remarked one day, that if we resolved things into their first principles, how few and simple they would be discovered to be! The vehicle of all knowledge was formed of the combinations of twenty-four letters—all calculations were generated from nine figures—and all the infinite variations of sound in music from eight notes. In speaking of Soame Jenyns, she gave an anecdote descriptive of his extraordinary easiness of temper and careless good-humour. A friend, who called upon him one morning, was pressed by him to take a slice of cold meat; but the servant, on being rung for, informed his master that there was not a morsel in his larder. When he had left the room, Mr. Jenyns turned to his friend and said, 'Now we had a large round of beef dressed yesterday; this is, therefore, rather unaccountable. But I expect these things; and that I may not be subject to lose my temper, I set down 300*l.* a-year to losses by lying and cheating, and thus I maintain my composure.' She told us one day of a *bon mot* of Burke's, who, expressing to her his dislike to closed book-cases in an apartment, exclaimed, 'I don't like this *Locke* on the human understanding.'

"She declared her strong objection to the application of consecrated words and phrases to familiar things; such as the 'Great Unknown,' Resurrection-men, the Ascension of a balloon—even the Redemption of the land-tax, the Salvation of the country, the Christening of a ship, &c. She said she often tried to pass a day without once saying, in reference to earthly things, 'I wish.'

"We have thus caught and imprisoned some fugitive vapours of her fine mind, as they rose and played in the corruscations of her returning health and spirits, with the freshness of the morning of her existence, when her elastic thoughts first awoke upon the scene of her future eminence, and the world's realities and excitements."

After another attack of ill health, and before she was able to quit her bed, she had vigour to project, and partly to execute, a plan, to which she had been often urged when in tolerable health—that of extracting from all her later works, each of which contained a chapter on prayer, her thoughts upon that subject. These passages, when brought together, with some additions, composed a little volume; to which she prefixed a few pious and touching sentences, by way of preface, and bequeathed it to her friends, not expecting herself to witness its publication. No sooner was this little book advertised, than the whole edition was bespoken; and another was in preparation before she herself had received a single copy of the first. It reached a third edition within three months of its first appearance.

A longer interval of moderate health and spirits now succeeded than she had for many years enjoyed. Bordering on the age of eighty-two, she was able to declare, that at no part of her life, in her recollection, had she been so little confined to her bed as during the last two years. In these two years, three of her oldest and best friends departed—Sir William W. Pepys, the venerable Bishop of Durham, and Lady Cremorne. Sir W. W. Pepys had maintained an affectionate and constant correspondence with her to the last years of his life, much of which appears in these interesting volumes; and from the good bishop she received more than one kind and friendly note, written with his own hand, not many months before his decease, at the age of ninety-one.

Mrs. More was now desirous of disposing of the reversion of Barley Wood—an event occurred to make it even necessary. Her age and infirmity gave too much license to her servants; she, accordingly, to escape from the inconvenience thus threatening her peace, removed to Clifton.

"From her apartment she was attended by several of the principal gentlemen of the neighbourhood, who had come to her that morning to protect her from the approach of any thing that might discompose her. She descended the stairs with a placid countenance, and walked silently for a few minutes round the lower room, the walls of which were covered with the portraits of all her old and dear friends who had successively gone before her; and as she was helped into the carriage, she cast one pensive parting look upon her bowers, saying, 'I am driven, like Eve, out of Paradise; but not, like Eve, by angels.'"

This was, in effect, the close of Mrs. More's literary, active, and intellectual life. Her memory soon gave signs of decay; on all subjects, except religion, she began to be at fault. It was on the 18th of April, 1828, at the age of eighty-three, that she arrived at Clifton, where she remained for five years and a half, *i. e.* till the 7th of September, 1833, the day of her decease. Of the circumstances attending the final scene (touching as all such are) we must refer our readers to Mr. Roberts' graphic narative. Her death-bed was a

scene of victory—of the spirit over the flesh; a witness of the truth and reality of another world.

From the length to which this article would have extended, we have been obliged to omit many letters that we would have willingly quoted. Out of three hundred letters by Mrs. More herself, sixteen by the celebrated Mrs. Montagu, nineteen by Sir W. W. Pepys, six by Lord Orford, five by Dr. Langhorne, six by Mr. Garrick, twenty-four by Mrs. Boscawen, twenty-four by Bishop Porteus, five by Archbishop Magee, twenty-three by the Rev. J. Newton, three by the Rev. R. Cecil, ten by Mr. Stephen, seven by Mrs. Kennicott, five by Bishop Horne, as well as a variety by the Duchess of Gloucester, Lady Cremorne, Lord Teignmouth, Lord Barham, Bishop Watson, Bishop Barrington, Dean Tucker, Mrs. Chapone, Mrs. Carter, Mrs. Barbauld, Mrs. Siddons, the Rev. T. Gisborne, and many others—out of all these, we say, there is room for selection. But we cannot do better than recommend the reader to peruse them all for himself, and in particular the excellent (though somewhat too laudatory) summary of Mrs. More's character, genius, and writings, in the last chapter of the life, written by Mr. Roberts, the amiable author of the *Portraiture of a Christian Gentleman*. For Mrs. More we have a high regard, as a stanch tory and a good churchwoman, though of the so-called evangelical clique. She was, however, practical in her piety; and this is the sure test of sincerity. Be her name therefore honoured! She was an extraordinary individual, and would have been such, had she not been an authoress. We esteem her personal character far, far above her literary. In the one she was truly great; in the other, respectable and prosperous. To sum up all, she was a practically wise and prudent woman; nevertheless, her prudence was an over-match for her wisdom. To perfection she wanted two grave requisites—greater intuitive knowledge, and a happy husband. The first she derived at second-hand and from shallow streams,—the last she avoided altogether. She thus escaped one great trial; but they who retreat from battle have no claim to the victor's wreath.

From the London Spectator.

MARCHIONESS DE CREQUY.

After the inquisition of the *Foreign Quarterly* into the authenticity of the *Recollections of the Eighteenth Century from* 1710 *to* 1800, one would scarcely have thought it necessary to translate the Memoirs of the Marchioness de Crequy. Yet it has been done by some English lady at Paris, and the result is two volumes octavo. Into the matter, manner, and merits of a work, whose *genuineness* is more than doubtful, it is not necessary to enter. This, however, may be said—that if they be forgeries, they are in one sense able ones; the forger has conceived and sustained the dramatic character of his heroine. The work tells us what an old woman of the old noblesse might have been supposed to tell us, and in her "auld wife" style. It is much ado about nothing.

From the Eclectic Review.

THE BOATMAN'S SONG TO GANGA.

[At Calcutta, Kasiprasad Ghosh, a Bramin, is universally beloved and admired: and we cannot but think that a vast field lies before him. The following little poem will give an idea of his fervid imagination and Oriental style.]

Gold river! gold river! how gallantly now
Our bark on thy bright breast is lifting her prow;
In the pride of her beauty how swiftly she flies;
Like a white winged spirit through topaz-paved skies!

Gold river! gold river! thy bosom is calm,
And o'er thee the breezes are shedding their balm;
And Nature beholds her fair features portrayed
In the glass of thy bosom—serenely displayed.

Gold river! gold river! the sun on thy waves
Is fleeting to rest in thy cool coral caves;
And, thence, with his tiar of light, at the morn,
He will rise, and the skies with his glory adorn.

Gold river! gold river! how bright is the beam
Which brightens and crimsons thy soft flowing stream;
Whose waters beneath make a musical clashing;
Whose ripples like dimples in childhood are flashing.

Gold river! gold river! the moon will soon grace
The hall of the stars with her light-shedding face;
The wandering planets her palace will throng,
And seraphs will waken their music and song.

Gold river! gold river! our brief course is done,
And safe in the city our home we have won;
And now, as the bright sun, who drops from our view,
So Ganga, we bid thee a cheerful adieu!

From the Court Journal.

ORIGIN OF THE GAME AT CHESS.

Eyles Erwin, Esq., during a long residence in the East Indies, asserts that a young Mandarin, named Tinqua, brought him a Chinese MS., containing an account of the origin of chess. In the MS. it is shown that 379 years after the time of Confucius, or 1,965 years ago, Hung Choch, king of Kiangnan, sent an army into the country of Chensi, under the command of a Mandarin, called Hansi, to conquer it. After one successful campaign the soldiers were put into winter quarters, where, finding the weather much colder than their own country, and being deprived of their wives and families, they became impatient of their situation and clamorous to return home. Hansi perceived the bad consequences of complying with their wishes, and the necessity of quieting his men, for the finishing of his operations in the ensuing year appeared urgent. He was a man of genius as well as a good soldier, and having considered for some time on the subject, invented the game of chess, as well to amuse their unemployed hours, as to inflame their military ardour, the game being wholly founded on the principles of war; the stratagem succeeded to his wishes, the soldiers were delighted with the game, and forgot in their daily contests for victory the inconveniences of their post. In the spring the general again took the field, and in a few months added the rich country of Chensi to the kingdom of Kiangnan, by the defeat and capture of its king, Choupuyuen, a famous warrior among the Chinese.

TRADITIONS OF THE AMERICAN WAR OF INDEPENDENCE.—NO. I.

For some time back we have meditated an expedition into the bowels of a huge trunk, which occupies a conspicuous corner in our sanctum. Venerable in its external dressing, it is still more venerable in its contents; for it is filled with musty papers—scraps, journals, letters, and other *disjuncta membra* of brave and good men now gathered to their fathers. We need not tell our readers, however, that it requires more than a common share of resolution to engage in such an enterprise. Of dust, thank God! we have no particular dread—we have had our own share of it through life; but cramp and crabbed hands, inscribed on mouldy and decayed paper, are no trifling obstacles to contend against. Therefore from day to day have we deferred a task, which now we sincerely regret that we had not sooner undertaken. But there is an ancient saying, with which all are acquainted, namely, "Better late than never;" and so last week we screwed our courage to the sticking place, and deciphered the manuscripts.

They are very curious. Some, indeed, are not fit, on various accounts, to meet the public eye; but there are others, for the introduction of which to their notice we suspect our readers will thank us. We therefore propose to give them in classes, beginning with those which we shall designate as Traditions of the American War of Independence, because they are neither woven into one story, nor written by one man. Our Tradition this month is from the pen of the late gallant General Samuel Graham, lieutenant governor of Stirling Castle. It is a portion of a journal which he has left behind; and, interesting as it appears to us to be, we beg to state that the journal in question contains other statements not less curious.

All the world is aware that in the month of October, 1781, after a defence which scarcely sustained his high reputation as a commander, Lord Cornwallis came to the melancholy resolution of surrendering to the arms of France and America the posts of Yorktown and Gloucester. Deceived he doubtless had been by Sir Henry Clinton, and the defences of the place, imperfect at the best, were in ruins. His projected burst from Gloucester, likewise, had been thwarted; though it may admit of a question whether it ought not sooner to have been tried. But however this may be—and at present it is not my business to argue the point—his lordship found himself incapable of further resistance, and on the 17th wrote to General Washington a despatch, of which the following is a copy:

"Sir,—I propose a cessation of hostilities for twenty-four hours, and that two officers may be appointed by each side to meet at Mr. Moore's house, to settle terms for the surrender of the posts at York and Gloucester."

General Washington's reply was very characteristic of the man—gentlemanlike, formal, but quite decided:

"My Lord,—I have the honour of receiving your lordship's letter of this date. An ardent desire to save the effusion of blood will readily incline me to listen to such terms for the surrender of your posts and garrisons at York and Gloucester as are admissible. I wish, previous to the meeting of the commissioners, that your lordship's proposals may be sent to the American lines, for which purpose a suspension of hostilities during two hours from the delivery of this letter shall be granted."

So began a negotiation concerning which all the world is aware that it ended in a treaty by which the posts in question were given up, and the British and German troops, to the number of seven thousand men, together with the crews of one or two armed vessels, which kept guard in the river, became prisoners of war—the former to the Americans, the latter, with the shipping and stores, to the French admiral.

On the 18th of October the terms of capitulation were ratified, and on the 19th the garrison marched to the spot agreed upon. Drums were beat, but the colours remained in their cases—an idle retaliation for a very idle slight which had been put by our people on the American garrison of Charleston; and the regiments having formed in columns at quarter distance, the men laid down their arms. It is a sorry reminiscence this; yet the scene made a deep impression at the moment, for the mortification and unfeigned sorrow of the soldiers will never fade from my memory. Some went so far as to shed tears, while one man, a corporal, who stood near me, embraced his firelock, and then threw it on the ground, exclaiming, "May you never get so good a master again!" Nevertheless, to do them justice, the Americans behaved with great delicacy and forbearance; while the French, by what motive actuated I will not pretend to say, were profuse in their protestations of sympathy. Crapeau is a singular compound of good and bad qualities;—brave, insolent, vain even in his acts of kindness, yet not wanting in generosity and chivalrous feeling. For myself, when I visited their lines, which I did immediately after our parade had been dismissed, I was overwhelmed with the civility of my late enemies. One pointed to a newly-made grave in the parapet of a battery, which our troops, in the course of a recent sortie, had entered. "Un de vos braves gens," said he; and it was so; for there lay a serjeant of the Guards who had fallen in the attack. While others freely tendered their purses, of which, fortunately for myself, and perhaps not less fortunately for them, I was not under the necessity of taking advantage. "Je n'ai rien à vous offrir," said one officer, evidently a person of rank, though his name I had no opportunity to ascertain, "car je n'aurai rien pour cinquante ans de service que la petite croix et le rheumatisme." I made my acknowledgments in the best way I could, and returned to my comrades.

Among other stipulations, it had been agreed by article 5, that "the soldiers should be kept in Virginia, Maryland, or in Pennsylvania, as much by regiments as possible, and that they should be supplied with the same rations of provisions as are allowed to soldiers in the service of America." The article went on to say, "A field-officer from each nation, to wit, British, Anspach, and Hessian, and other officers on parole, in the proportion of one to fifty men, to be allowed to reside near their respective regiments, to visit them frequently, and be witnesses of their treatment." I happened to be numbered among the officers on whom the lot fell to keep with the men; and our British field-officer was Major Gordon—a man whose memory will be cherished as long as a single individual shall survive of all who shared in that captivity. He took the place of a field-officer of the Guards, whose turn of duty it was, but who exhibited such reluctance that this high-minded officer interfered, rightly judging that he whose heart is not with his men will never apply, as he ought to do, his whole faculties to ensure their comfort. But let that pass. My purpose is sufficiently served when I say that Major Gordon

acted as our superintendent, and that we never found cause to express other feelings than those of thankfulness that the case was so.

On the 20th of October the British troops marched out of York in two divisions; one of which, guarded by States soldiers, proceeded towards Maryland, while the other, to which I was attached, went, under an escort of militia, to the westward of Virginia. The journey was as little disagreeable as any compulsory movement, performed under such circumstances, could well be. The militia-men proved particularly kind; for they not only permitted our people to carry away fence-rails for firewood, but protected them, while in the act of doing so, from the threatened vengeance of the proprietors. To be sure there was a motive for this, apart from a generous desire to see their prisoners accommodated: no good understanding existed at this time between the inhabitants of Lower and Upper Virginia, and as our guards chanced to belong to the latter province, they were not very fastidious in their dealings with the proprietors of the former.

In the course of this march we traversed the lower ridge of the Blue Mountains by a pass called Ashby's Gap. While the head of the column was yet a good way off, I rode forward, and alighted at an inn which was kept by a person named Ashby, about half way down the gorge. The hostess met me at the door—"A militiaman I guess," said she. "No, ma'am," was my reply. "Continental, mayhap?" "No, ma'am." "Oh, I see," exclaimed the old lady, "you're one of the sarpents—ould Wallace's men. Well now, I have two sons—one was at the catching of Johnny Burgoyne, the other at the catching of you, and they are both going next year to catch Clinton at New York. But you shall be kindly treated: my mother was from the old country." And the honest woman kept her word. I was very kindly treated; and what is more, the reckoning proved to be unusually moderate even for that cheap country.

I pass over the remainder of our march, during which no adventure befell that deserves, as far as my memory bears me out, minute repetition. Winchester was the place of our destination; an inconsiderable town in those days, and surrounded at a short distance by gigantic forests, amid which were erected some straggling villages of log huts for the accommodation partly of the prisoners taken in the affair of Cowpens, partly of the troops employed to watch them. Thither our men were conducted; and though the lodging was indifferent, and the issue of provisions, particularly of flour, very irregular, of the treatment which they received, both from the guards and the country people, they had no reason to complain. The former put them under little or no restraint; while the latter gave them frequent invitations to their farm houses, from accepting which we did not, for obvious reasons, think it necessary to restrict them.

As the winter drew on, the hardships to which our men became exposed increased greatly. The huts, besides that they were inconveniently few in number, proved, in many instances, pervious to the weather, and the health of their inmates began in consequence to suffer. I applied, under such circumstances, to the commissary, and obtained from him an order that a church in town, capable of containing five hundred persons, should be set apart for their use. But the arrangement was scarcely complete, when I received a message from Brigadier General Morgan, intimating that the church must be immediately given up. I ventured to remonstrate, in a letter written with all possible mildness, and in a strain which could not fail, as I conceived, to melt the heart of the rugged republican. The following is a copy of his answer.

"*Saratoga, 28th November*, 1781.

"Sir—I received your letter of this day's date, and am really surprised at the contents of it. Two or three days before Christmas our army began to hut at Middleton in the Jerseys, and had nothing to keep off the inclemency of the weather till huts were built. You have time enough. This snow won't last long; it will be gone immediately. If your men don't know how to work, they must learn. We did not send for them to come amongst us, neither can we work for them to build them houses. I have been a prisoner as well as they, and was kept in close jail five months and thirteen days—thirty-six officers and their servants in one room, so that when we lay down on our straw we covered the whole floor. Consider this, and your men have nothing to grumble at. Colonel Holmes, though a commissary of prisoners, is under control. You have nothing to do but hut your men as fast as you can, for that must be the case. I have sent to General Washington, informing him of all matters—of what I had done and intended to do; and as he has never yet found fault with my conduct, you'll conclude from this that Colonel Holmes must obey my orders. The sooner your men hut themselves the better, for they must not remain in town much longer. I will try to redress every grievance as well as I can; but this I cannot look upon as a grievance. If we had barracks to afford them, they should have them; but as we have them not, they must cover themselves—at least I would recommend it to them, or they will suffer. I have written this letter in a plain rough style, that you might know what you had to depend upon, at which I hope you will not take umbrage."

The receipt of this letter, while it left little reason to hope that the writer would be induced by further discussion to change his mind, excited in me a good deal of curiosity to meet him; and I was very glad when, a few days afterwards, he visited Winchester. I sent him an invitation to dinner, which he accepted without scruple; and a very pleasant evening we spent together. The landlord of the house in which I lodged being a militia colonel, made one of the party, between whom and the brigadier some interesting conversation passed. It may be necessary to state that Morgan had commanded a battalion of riflemen which performed good service in various quarters, and that he had been actively engaged in the operations which ended in the surrender of General Burgoyne. He alluded to that affair with undisguised triumph, and spoke with more volubility perhaps than good taste of his own exploits on the occasion. "Oh, we whopped them tarnation well, surelie," said he, rubbing his hands; "though to be sure they gave us tough work too. But it was on the 7th of October that the rifles settled the business. Me and my boys attacked a height that day, and druve Ackland and his grenadiers; but were hardly on the top when the British rallied, and came on again with such fury that nothing could stop them. I saw that they were led by an officer on a gray horse—a devilish brave fellow; so, when we took the height a second time, says I to one of my best shots, says I, you get up into that there tree, and single out him on the white horse. Dang it, 'twas no sooner said than done. On came the British again with the gray horseman leading; but his career was short enough this time. I jist tuck my eyes off him for a moment, and when I turned them to the place where he had been—pooh, he was gone!"

I knew at once that he spoke of General Fraser, who rode that day a gray horse, and fell from a rifle ball through the body. But Morgan did not confine his loquacity to communications like this. He told us that the British owed him a lash: that he drove one of the wagons which accompanied General Braddock's army, and being a giddy young man, that he had, on a certain occasion, knocked down a sentinel; for that offence he had been condemned to receive four hundred lashes, of which only three hundred and ninety-nine were inflicted —"I counted them myself," continued he, laughing, "and am sure that I am right; nay I convinced the drum-major of his mistake, but they wouldn't tie me up again; so I am still their creditor to the amount of one lash."

Whether the intercourse which I had thus established with General Morgan operated at all in our favour, I do not know; but within a few days an order arrived directing us to march, not into the woods again, but to a comfortable barrack, surrounded by a high stockade, about ten miles south of the Susquehanna river. Here, in the vicinity of Little York, we passed some time agreeably enough; for though the men were more strictly watched than at Winchester, their quarters were much less inconvenient, and their provisions more abundant, as well as supplied with increased regularity. Besides, we had frequent opportunities of communicating with Philadelphia, and occasionally with New York itself; while the newspapers that from time to time reached us from the former city proved extremely acceptable. But the interest which we took in the perusal of the latter began, by degrees, to wax more intense when we found them mainly devoted to details of atrocities said to be committed by the royalist refugees, each of which was invariably summed up with a demand for vengeance. At last a correspondence appeared, of which I submit a copy:

"*Head-quarters*, 21*st April*, 1782.

"Sir,—The enclosed representation of the inhabitants of Monmouth, with testimonials to the fact, which can be corroborated by other unquestionable evidence, will bring before your excellency the most wanton, cruel, and unprecedented murder that ever disgraced the arms of a civilised people. I shall not, because I consider it altogether unnecessary, trouble your excellency with any animadversions on this transaction. Candour obliges me to be explicit. To save the innocent, I demand the guilty. Captain Lippercut, or the officer who commanded at the execution of Captain Haddy, must be given up; or if that officer was of inferior rank to him, so many of the perpetrators as will, according to the tariff of exchange, be an equivalent. To do this will mark the justice of your excellency's character; in failure of it, I shall hold myself justified in the eyes of God and man for the measures to which I shall resort. I beg your excellency to be persuaded that it cannot be more disagreeable to you to be addressed in this language than it is for me to offer it; but the subject requires frankness and decision. I have to request your speedy determination, as my resolution is suspended but for your answer.

"I have the honour to be, &c.

"Geo. Washington.

"To his Excellency Sir Henry Clinton, K.B., &c."

"*New York* 22*d April*, 1782.

"Sir,—Your letter of the 21st instant, with the enclosed testimonials of Captain Haddy's execution, was delivered to me yesterday. Though extremely concerned at the cause, I cannot conceal my surprise and displeasure at the very improper language you have made use of, which you could not but be sensible was totally unnecessary. The mildness of the British government does not admit of acts of cruelty and persecuting violence; and as they are notoriously contrary to the tenor of my own conduct and disposition, having never yet stained my hands with innocent blood, I must claim the justice of having it believed that if any such have been committed by any person under my command, they could not have been warranted by my authority, nor can they ever have the sanction of my approbation. My present feeling, therefore, needed no incitement to urge me to take any proper notice of the barbarous outrage against humanity which you have described, the moment it came to my knowledge; and accordingly, when I heard of Captain Haddy's death, which was only four days before I received your letter, I instantly ordered a strict enquiry to be made into all its circumstances, and shall bring the perpetrators of it to immediate trial. To sacrifice innocence, under the notion of preventing guilt, in place of suppressing would be adopting barbarity and raising it to the greatest height; whereas, if the violators of the laws of war are punished by the generals under whose power they act, the horrors which those laws were formed to prevent would be avoided, and every degree of humanity war is capable of maintained. Could violations of humanity be justified by example, many, from the posts where your power prevails, that exceed, and probably gave rise to this in question, could be produced. In hopes that the mode I mean to pursue will be adopted by you, and prevent all future enormities, I have the honour to be, &c.

"Henry Clinton.

"To his Excellency General Washington."

These letters were read, as may be imagined, with deep interest by all of us. Not that we could assign any adequate cause for the feeling, inasmuch as the language employed on both sides was abundantly general; yet we saw, or fancied that we saw, in the tone of Washington's communication, something which boded no good to some of our comrades. Nevertheless, a fortnight having elapsed without any renewal of the correspondence, our uneasiness had begun to subside, when a fresh file of Philadelphia papers presented us with the following, of which the purport was even more undisguised. The first was evidently in reply to a despatch which General Robertson, the temporary successor of Sir Henry Clinton, had dictated.

"*Head-quarters*, 5*th May*, 1782.

"Sir,—I had the honour to receive your letter of the first instant. Your excellency is acquainted with the determination expressed in my letter to Sir Henry Clinton, of the 21st of April. I have now to inform you, that so far from receding from that resolution, orders are given to designate a British officer for retaliation. The time and place are fixed, but I shall hope the result of your court-martial will prevent the dreadful alternative.

"Geo. Washington."

Before this letter reached its destination, Sir Guy Carleton had superseded General Robertson. He answered it thus:—

"*New York*, 7*th May*, 1782.

"Sir,—I am much concerned to find that private and unauthorised persons have, on both sides, given way to those passions, which ought to have received the strongest and most efficient control, and which have begot acts of retaliation, which, without further preventions, may have an extent equally calamitous and dishonourable to both parties; though, as it should seem, more extensively

pernicious to the natives and settlers of this country. How much soever we differ in other respects, upon this one point we must perfectly concur, being alike interested to preserve the name of Englishman from reproach, and individuals from experiencing such unnecessary evils as can have no effect on general decisions. Every proper measure that may tend to prevent those criminal excesses in individuals, I shall ever be ready to embrace; and as an advance on my part, I have, as the first act of my command, enlarged Mr. Livingston, and have written to his father in New Jersey, desiring his concurrence in such measures as, even under the conditions of war, the common interests of humanity require.

"I have the honour to be, &c.,

"GUY CARLETON."

[ANSWER.]

"*Head-quarters, 9th May*, 1782.

"SIR,—I had the honour this evening to receive your excellency's letter of the 7th, with the several papers enclosed. Ever since the commencement of this unnatural war, my conduct has borne invariable testimony against those inhuman excesses that in too many instances have marked its various progress. With respect to a late transaction, I have already expressed my fixed resolution, —a resolution formed upon the most mature deliberation, and from which I shall not recede.

"G. WASHINGTON."

I repeat, that we read this correspondence, accompanied as it was by a sort of running commentary from a person under the signature of Common Sense, with the deepest interest. Not that any of us entertained the slightest apprehension of danger to himself. We were prisoners on parole, under a capitulation, the fourteenth article of which expressly stipulated that it should suffer no violation on the pretence of reprisal. But there were others of our comrades whom we knew to be less favourably circumstanced; and remembering the stern inflexibility of Washington in the case of poor André, we could not but tremble for the lot of one of these. Our astonishment, therefore, may be imagined, when the following occurrences took place.

I had spent a few days with Major Gordon at Lancaster, and was on a visit to some friends at Little York, when the major unexpectedly arrived among us, evidently labouring under an excess of agitation, of which he declined to state the reason. All that we could get from him was a request, that an order issued by the American commandant would be obeyed, and that all the captains belonging to the remains of Lord Cornwallis's army would assemble next day at his quarters. He added, that it would be advisable to bring with us each man his servant, and such a supply of linen and other necessaries as might suffice for some time. We obeyed, not without wonder. A long ride during a broiling day carried us to Lancaster, and at three in the afternoon we met, to the number of thirteen, at the major's quarters. He was pacing the room backwards and forwards when we entered, and after a brief salutation, proceeded, with much feeling, to explain the circumstances which had caused the meeting. "You have all seen the correspondence that has for some time been carried on between General Washington and the commander-in-chief at New York, and you therefore know, that Washington has determined to revenge upon some innocent man the guilt of a set of lawless banditti. Gentlemen, you will scarcely believe that in the face of the capitulation, and in defiance of the strong remonstrances which I felt it my duty to make, both to the American and French authorities, one of you is doomed to suffer. I have told Washington that he will be answerable for this foul deed to all posterity; but I might as well reason with the air! I wish to God they would take me in your place; for I am an old worn out trunk of a tree, and have neither wife nor mother to weep for me. But even to that they will not consent; so all that I can undertake to do is, to accompany the unfortunate individual, whoever he may be, to the place of his martyrdom, and to give him every consolation and support while life remains, and obey his wishes after it is taken away." The major, albeit not given to the melting mood, could not here restrain his tears; and there was not a soul among us who did not feel a thousand times more for him than for ourselves.

It will readily be imagined that such an announcement as this, bringing with it the contemplation of certain death, in cold blood, to one of our number, had not the effect of greatly elevating our spirits. Still we kept up a good heart, chiefly on the major's account, and spent a tranquil and even a lively evening at his table. For myself, likewise, I can state, that never, at any period of my life, have I slept more soundly than I did that night on a mattress in his chamber, after having vainly striven to cheat my excellent friend into a forgetfulness of the care and anxiety which preyed upon his mind. A like, perhaps a more exuberant, spirit pervaded us on the following morning. We were to assemble at the quarters of the American Brigadier-General Hogan, at nine o'clock, and there draw lots for life or death; and we repaired to the place appointed, as cheerful and loquacious as if we had been going to a ball: yet it was a solemn scene enough. The brigadier, attended by his aide-de-camp and the commissary of prisoners, occupied an apartment in the Black Bear Inn, where we were introduced to them. They were all a good deal agitated, and the voice of the first faltered a little, when he craved permission to read two letters which he had received at different periods from General Washington. I subjoin them.

"*Head-quarters, 4th May*, 1782.

"SIR,—The enemy persisting in that barbarous line of conduct they have pursued during the war, have lately most inhumanly executed Captain Jonathan Haddy of the Jersey State troops, taken prisoner by them at a post on Jones's River, and in consequence I have written to the British commander-in-chief, that, unless the perpetrators of this horrid deed were delivered up, I should be under the necessity of retaliating, as the only means left to put a stop to such inhuman proceedings. You will, therefore, immediately on receipt of this, designate by lot, from the above number, a British captain who is an unconditional prisoner, if such a one is in our possession; if not, a lieutenant under the same circumstances, from amongst the prisoners at either of the posts in Pennsylvania or Maryland. As soon as you have fixed upon the person, you will send him under a safe guard to Philadelphia, where the minister at war will order a proper guard to receive and conduct him to his place of destination. For your information respecting the officers who are prisoners in our possession, I have ordered the commissary of prisoners to furnish you with a list of them, which will be forwarded with this. I need not mention that every possible tenderness, that is consistent with the security of him, should be shown to the person whose unfortunate lot it may be to suffer."

This was the first despatch: the second, which bore date 13th of May, ran as follows:—

"SIR,—It was much my wish, for the purpose of retaliation, to have taken an officer who was an uncon-

ditional prisoner of war, but being informed by the secretary at war, that no one of that description is in our power, I am under the disagreeable necessity to direct, that you immediately proceed to select, in the manner before prescribed, from among all the British captains who are prisoners, either by capitulation or on convention, one who is to be sent in as soon as possible, under the regulations and restrictions contained in my former letter to you."

Having concluded the reading of these letters, the brigadier proceeded to say, that it was very much his wish that we would settle among ourselves on whom this sad fate should be fixed. With one voice we refused to have any share in a business which directly violated the terms of that treaty which placed us within General Washington's power. "But were it otherwise," remarked the major, "these gentlemen form but a small proportion out of the total number of captains who became prisoners at Yorktown; and I am sure that if time be afforded, there is not one of their comrades who will not hasten even from England, for the purpose of placing himself by their side in so trying an emergency, and staking his life with theirs."

The brigadier, however, was deaf to all remonstrances. His orders, he said, were peremptory—he was very sorry, but he could not even consent to so much delay as might be necessary to bring up a captain from Virginia, where, on the march of the depôt into Maryland, he had been left. "When all is over," he continued, "and the lot has declared on whom the blow must fall, then you may rely upon it, that every indulgence shall be shown which you could expect, or my own feelings dictate." But in the meanwhile there remained but one course to pursue. A victim must be chosen from the gentlemen present, and the aide-de-camp was directed to prepare the lots in another apartment.

It would be impossible to describe the sensations which I experienced, and which were, I doubt not, experienced in a like degree by others during the brief pause which ensued on this officer's departure. Few words were interchanged—though all kept up, apparently without any exertion, a good countenance. But the pause was not of long duration; for in about ten minutes the aide-de-camp returned, accompanied by another gentleman, each bearing in his hand a hat—while a drum-boy followed, as well as an officer of dragoons, the commander, as we were already apprised, of the prisoner's escort. In each hat were thirteen pieces of paper. That held by the aide-de-camp contained twelve inscribed with names and one blank: that held by the other gentleman, twelve blanks and one inscribed with a name. The drum-boy put in his hand, and after reading a name aloud, drew a slip of paper from the second hat, which, as long as it was blank, left the individual named, in safety. Ten names were thus drawn; the eleventh—having the fatal mark attached to it—was that of Captain Asgill of the Guards, to whom the brigadier pointed, while he said to the officer of dragoons, "That gentleman is your prisoner."

The excitement of the scene was now over, and we gazed upon poor Asgill with a bitterness and intensity of feeling such as defied control. He was barely nineteen years of age—lively, brave, handsome—an only son, as we all knew, and an especial favourite with his comrades. To see him, as we did at that moment, in the full bloom of youth and beauty, and to know that his days—nay, his hours were numbered—that was a demand upon the fortitude of those who loved him, such as they could not meet. We all lifted up our voices and wept; and while a warm pressure of the hand was exchanged with each in his turn, the object of so much commiseration found it no easy matter himself to restrain his tears. Nor, to do them justice, were the Americans, either within or without the house, indifferent spectators of the drama. The brigadier at once consented to delay the removal of the victim till the following morning, and readily granted a passport for the purpose of enabling an officer to set out on the instant for New York. The crowd too—and a dense multitude was assembled round the house—evinced their sympathy by such exclamations of pity as crowds are wont to offer, while at the same time frequent voices were heard to exclaim, "Well, them Britishers be strange chaps; they all went in laughing and talking—and now, when the thing is settled, they are all in tears, except the young man on whom the lot has fallen." And so in truth it was: there was not a dry eye among us, except that of Asgill himself, as we proceeded from the Black Bear to Major Gordon's quarters.

Arrived there, and Asgill being placed under gentle restraint, the grief of his comrades yielded to the necessity of exertion. Blanks in letters, which had been previously written, were filled up; and while one of our own number set off express with that designed for Sir Guy Carleton, Brigadier Hogan despatched that to General Washington by a special messenger. Not content with these exertions, Major Gordon, having ascertained the address of the Compte de Rochambeau, wrote also to him; and as he committed the despatch to the care of a trustworthy person, there is the best reason to believe that, though never answered, it reached its destination. Still events held their course; the night wore on in spite of the anxiety and grief which would have retarded it; and with the dawn of the following day came the necessity for Asgill's departure. Again the forethought of Major Gordon interposed to protract the final catastrophe to the latest possible moment: he prevailed upon the brigadier to mark the route of the party by short stages, and obtained from him an order, that in all matters not at variance with the safe-keeping of the prisoner, implicit attention should be paid to his wishes. Last of all, he procured from the good-natured commandant the addresses of the most influential persons in Philadelphia; and, hoping almost against hope, that something might be done through their intercession, he strove throughout the journey to keep up both his own spirits and the spirits of the poor youth for whom he thus assiduously laboured.

The escort reached Philadelphia without the occurrence of any adventure, and Gordon having procured a lodging, planted a sentinel at Asgill's door, with strict orders that no one should be allowed to disturb him unless sent for. This done, he himself sallied forth. But all his applications were met with a coldness which he failed to overcome, or a frank declaration that the deliverance of the young victim, except on the terms already announced, was impossible. Utterly dejected, he returned home, and had thrown himself upon his bed, when the sound of footsteps approaching Asgill's chamber roused him; he ran out, and beheld a tall gaunt figure, arrayed in black, with an expression of singular austerity in his countenance, advancing with measured tread towards the door.

"Who are you—what do you want?" were the brief questions.

"Sir," replied the figure with extreme solemnity, "I am chaplain to the Congress of the United States, and I am come to give a word of advice to the young man who is about to suffer for the death of our good countryman, Captain Haddy."

The major was a religious man, in the best sense of that term, and entertained unfeigned respect for the clergy; but his temper was at the moment rendered irritable by his recent repulses, and the manner in which the divine spoke of the approaching murder of his friend threw him entirely off his guard.

"I tell you what," cried he, springing forward, "if you do not immediately remove yourself from this house, I will show you the shortest way into the street, even if it should be from the window."

The divine looked aghast, and retreated as the other drew on, till he gained, without being aware of it, the top of the staircase, when suddenly his back step failed him, and he rolled from the top to the bottom. No further mischief followed, however, except the loss of his hat and wig, both of which fell off in the tumble, for Mass John was not long prostrate: he rose immediately, and apprehending he knew not what further violence, grasped the wig, clapped it wrong end foremost upon his head, and holding his hat in his hand, ran with the speed of a lamplighter down the street. Poor Gordon! many a time has he laughed himself, and caused others to laugh, at the recital of that adventure.

Previous to the march of the escort from Lancaster, I had by some fortunate accident obtained a copy of a handbill, in which the defeat and capture of De Grasse in the West India seas was announced. I had given it to Major Gordon, who now hastened with it to the house of the French ambassador, and laid it before him. My object in so doing was to work upon the fears of that functionary by threatening him with retaliation in the persons of the prisoners; but here again we failed. The ambassador refused to interfere, while other persons, on whom his great energy seemed to have weight, received a sudden order to quit the town; a fatal sign that the resolutions of the government were immovable.

Time passed, and though the execution of poor Asgill was delayed, every preparation continued to be made for its completion. He was removed from Philadelphia to Chatham, a post in the advanced line of the Americans towards New York; and Gordon, with the devotion of a father for his child, attended him. I am afraid that I should become tedious were I to describe all the steps which that excellent man took to procrastinate, and, if possible, to avert the threatened calamity. He had many trusty persons in his pay, by means of whom he kept open a constant correspondence with head-quarters, and he succeeded in giving to the official communications of the several chiefs a tone which enabled him to appeal not only to the court of St. James's, but to to that of the Tuileries. Nor was this all: Captain Haddy's family, worked upon by the pathetic appeals of Gordon, became themselves suppliants in Asgill's favour; and a plan, to which few were privy, but which was so well laid that its success came at least within the bounds of probability, was, in case of the worst, arranged for his escape. Meanwhile, however, Lady Asgill was informed of the danger with which her only son was menaced, and she threw herself, with all the eloquence which a mother's feelings are calculated to call forth, at the feet of the French minister. I wish that I could, with any regard to brevity, transcribe the letter with which he besought the interference of the French monarch, as well as that which the Count de Vergennes addressed in consequence to General Washington: they are both lying beside me; and more admirable specimens of deep emotion, expressed in the most touching, because in the simplest language, I have never perused. But this tradition has already occupied too much space in your Journal. Let it suffice to state then, that the exertions of Asgill's friends prevailed, and that on the 13th of November the prisoner read from General Washington the following manly communication:—

"Sir,—It affords me singular satisfaction to have it in my power to transmit to you the enclosed copy of an act of Congress of the 7th inst. by which you are relieved from the disagreeable circumstances in which you have been so long. Supposing that you would wish to go to New York as soon as possible, I also enclose a passport for that purpose. Your letter of the 18th came regularly to my hands. I beg of you to believe that my not answering it sooner did not proceed from inattention to you, or a want of feeling for your situation; but I daily expected a determination of your case, and I thought it better to await that than to feed you with hopes that might in the end prove fruitless. You will attribute my detention of the enclosed letters, which have been in my possession a fortnight, to the same cause. I cannot take leave of you, sir, without assuring you, that in whatever light my agency in this unpleasant affair may be viewed, I was never influenced throughout the whole of it by sanguinary motives; but by what I conceived to be a sense of duty, which loudly called upon me to use measures, however disagreeable, to prevent a repetition of those enormities which have been the subject of discussion; and that this important end is likely to be answered without the effusion of the blood of an innocent person, is not a greater relief to you, than it is to, sir, &c.

"Geo. Washington."

Immediately on the receipt of this letter Asgill felt that he was free, and he returned shortly afterwards, in excellent health and spirits, by way of New York to England. Not so his and my friend, Gordon. He was an altered man. A constitution, delicate at the best, and weakened for some years by the progress of an internal complaint, could not endure the wear and tear of excitement and exertion to which he had recently been subjected. While we remained as prisoners, and that was till the formal cessation of hostilities, I never saw him smile, except when describing his rencontre with the Yankee chaplain in Philadelphia; and though on our release he was appointed to command at Kingsbridge, not even so complete a change of scene and occupation had any effect. I spent much of my time with him at Morristown, where he fixed his head-quarters, and found that a settled melancholy preyed upon his spirits; yet there was no apparent cause for this: on the contrary, the fame of his exploits being spread far and near, he received both from friends and foes the most striking marks of respect; indeed, to such a height was the feeling carried, that being appointed to act as one of a sort of court of enquiry, to which was committed the task of adjusting disputes between the natives and the refugees, every claimant from the province of the Jerseys, no matter to what party attached, eagerly sought to have his cause decided by Major Gordon.

Being myself a member of this same court, which held its sittings at New York, I was enabled to see a good deal of my friend, till the business submitted to us was at length wore out, and we separated. He settled in Morristown, while I betook myself to Staten Island, where my regiment was quartered. This had not long occurred, when a packet arrived from home, bringing with it a Gazette, in which, to the great joy of all who were acquainted with him, the name of Gordon appeared as a lieutenant colonel by brevet. The same packet brought likewise a letter from Asgill's mother, so touch-

ing in itself, and at the same time so linked with the fate of Gordon, that I must be permitted to transcribe it. It ran thus:

"Sir,—If distress like mine had left any expression but for grief, I should long since have addressed myself to you, for whom my sense of gratitude makes all acknowledgments poor indeed; nor is this the first attempt; but you were too near the dear object of my anguish, to enter into the heart-piercing subject. I constantly prayed to Heaven, that he might not add to his sufferings the knowledge of ours. He had too much to feel on his own account, and I could not have concealed the direful effect of his misfortune on his family, to whom he is as dear as he is worthy to be so. Unfit as I am at this time by joy, almost as insupportable as the agony before, yet, sir, accept this weak effort, from a heart deeply affected by your humanity and exalted conduct, as, Heaven knows, it has been torn by affliction. Believe me, sir, it will only cease to think, in the last moment of life, with the most grateful, affectionate, and respectful sentiments to you. But a fortnight since I was sinking under a wretchedness I could no longer struggle with. Hope,—resignation,—had almost forsaken me. I began to experience the greatest of all misfortunes, that of being no longer able to bear them. Judge, sir, the transition, the day after the blessed change takes place. My son is released,—recovered,—returned,—arrived at my gate,—in my arms. I see him unsubdued in spirits, in health, unreproached by himself, approved of by his country,—in the bosom of his family, and without anxiety, but for the happiness of his friend,—without regret but for having left him behind. Your humane feelings that have dictated your conduct to him, injured and innocent as he was, surely will participate in our relief and joy. Be that pleasure yours, sir, as well as every other blessing that virtue like yours, and Heaven, can bestow. This prayer is offered up for you in the heat of transport, as it was in the bitterness of my anguish. My gratitude has been soothed by the energy it has been offered with; it has ascended to the throne of mercy; and is, I trust, accepted. Unfit as I am, for nothing but susceptibility so awakened as mine could enable me to write,—and exhausted by too long anxiety,—confined at this time to a bed of sickness and languor,—yet I could not suffer another interval to pass without this weak effort. Let it convey to you, sir, the most heartfelt gratitude of my husband and daughters. You have the respect and esteem of all Europe, as an honour to your country, and to human nature, and the most zealous friendship of,

"My dear and worthy Major Gordon,

"Your affectionate and obliged servant,

"J. Asgill."

The preceding letter had not been long forwarded, and I had resided but a few days on Staten Island, when I received an express, desiring my immediate attendance at Morris's house. I did not lose a moment in obeying, and arrived there in time to find the major in the agony of death. His life was fast expiring, yet he retained his senses; and as he squeezed my hand, he exclaimed in a feeble voice, "You are just come in time. Write, I pray you, to the lady from whom I have received this letter, and apologise for my apparent negligence in not replying to it. I have been told, on good authority, that our noble prince has been pleased to express his approbation of my conduct. Should it ever so happen, that you could take so great a liberty, tell him, oh! tell him, what a comfort it was to me at this trying hour, to know, that the mere performance of my duty should have been so honoured by the applause of so exalted a character." I promised that I would attend to his last wishes in both particulars; and I thank God that I have been able to redeem the pledge. Years, indeed, elapsed ere I found an opportunity of delivering to George IV. the message of his dying servant. But I did deliver it, and the lapse of these years had not sufficed either to blot poor Gordon from the recollection of our gracious sovereign, or to render the king indifferent to his fate. As to Gordon himself, he did not long survive our interview. He died a martyr to his own noble feelings, having, in the most literal sense of the term, given his life to redeem that of his friend.

—

We have only to add to this, that a rumour has reached us, that a life of the writer of the above is in preparation. We sincerely trust that our information may prove well founded, for we knew enough of the gallant veteran's career to assure our readers, that if it be narrated with tolerable fidelity, it cannot fail both to interest and to instruct.

NEW MUSICAL INSTRUMENT.

An ingenious mechanician of Vienna has recently invented a new instrument, to which he has given the name *Phonomime*, (from the Greek *phoniomimos*, signifying to imitate the human voice). In outward appearance, the instrument resembles a cabinet piano-forte; but the key-board is not more extensive than that of the old clavicorde. The tone, which is produced by means of pipes, presents an exact similarity to the human voice, an effect which has never yet been produced so perfectly by any musical instrument.

The *Phonomime* has four registers; bass, baritone, tenor, and soprano, or, as it may properly be demonstrated, falsetto; for the inventor has, by some ingenious contrivance, avoided any approximation to the tone of the flute or the female voice.

Every chord performed on the *Phonomime* produces an effect similar to the harmony of sonorous male voices, and the hearer can scarcely persuade himself that he is not listening to a fine chorus executed by men. This effect may be said to be perfect when a vocal composition is performed on several *Phonomimes* played together.

An experiment of this effect was tried in the house of a distinguished dilletante of Vienna. The instruments and performers were placed in an apartment adjoining the drawing-room in which the company were assembled. The illusion was complete. All present imagined they were listening to a chorus of excellent singers, and bestowed high praise on their fine voices and accurate execution.

Junius's Letters.—It is said a great literary curiosity has recently been discovered: the identical copy of *Junius's Letters* in two volumes, bound in vellum, by Mr. Woodfall, the publisher, at the express wish of the author; which copy is particularly alluded to in the variorum edition of these letters, published by Mr. George Woodfall a few years ago.—*Morning Chronicle.*

From the Monthly Review.

Third and Fourth Meetings of the British Association for the Advancement of Science.

This Association is progressing with wonderful celerity to unexampled eminence. If we merely take the increase in the number of members, since the first meeting of the society, we must be convinced of the rapid growth of its power and influence. At York 350 met; 700 at Oxford; 1,400 at Cambridge; and 2200 at Edinburgh this year. But numerical increase, and relative magnitude, are not the only tests to go by, in judging of the gradually enlarging worth and importance of the British Association. Let us for a moment refer to the additional names that swell the lists of the latest meeting; and there we find not merely the most celebrated scientific men in England, Ireland, and Scotland, but many from foreign parts, who it is believed never before set foot upon British ground. A better evidence still is to be found in the materials which the association has already actually contributed to science in a great variety of departments. But before directing the attention of our readers to what has been done in the course of the two last meetings, we have the highest satisfaction in referring to some of the indirect bearings of this great and now established union.

We hail the British Association, not merely as an excellent instrument for promoting the advancement of science. This is, to be sure, one great advantage, and that which is immediately contemplated by such a philosophic union. For in that field, when alone, man is comparatively nerveless, whilst the power derived from concentration is immense; and though vast achievements have been accomplished in private, yet the sparks that touched the genius and kindled the light by which they were first attempted and carried through, originated from mingling with the world, and having intercourse with men of kindred spirits. But besides, this society has become, and doubtless will continue to be, the occasion of bringing together the most influential men from all parts of the world. There were in Edinburgh, at the fourth meeting, philosophers of the very highest rank, from France, Utrecht, Baden, Berlin, Weimar, Rome, Geneva, the Island of Chios, America, &c. &c. The great barrier, which so long had severed man from man, and prevented them even from understanding one another's language, has been broken down, and we believe for ever in the civilised world. The strife now is for knowledge. A distinct matter from any of these, which in the nature of things must result from this and all such wise institutions, is the services which they confer upon the most important truths connected with the destinies of man. For it is nothing less than a libel on the Creator and Ruler of all things, to say that the investigation of truth can lead to error and evil. Infidelity and irreligion are the result of ignorance, as much as of prejudice or presumption. The boldest researches in physical science, for example, are calculated the most to display the power, the wisdom, the harmony, and the beauty of Him who guides the planets in their course, who rules a thousand suns and their systems, and whose name is The Eternal.

Of the contents of the volume, embracing a report of what was done at the third meeting, held at Cambridge last summer, we must chiefly refer our readers to a luminous outline afforded by Professor Forbes this year at Edinburgh, in his programme of the subjects to which the attention of the Association was about to be directed. But before quoting part of the able summary, we cannot but gratify every thinking person by a few of the Rev. W. Whewell's views, in his exposition of the preceding transactions of the society to those entered upon at Cambridge. Let none, said he, suppose that they ascribed to assembled numbers and conjoined labours extravagant powers and privileges in the promotion of science, or that they believed in the omnipotence of a parliament of the scientific world. There was no royal road to knowledge; neither was there any way of making it shorter, because those that press forward were many. All must start from their actual position, and the advance cannot be accelerated by any method of giving each man his mile of the march. Yet, care may be taken that those who come ready to start from the proper point, and in the proper direction, shall not scramble over broken ground, when there is a causeway parallel to their path. A man cannot create, nor even direct the powers of discovery, but he may aid them to direct themselves. Of the connection between art and science, he said that practice had always been the origin and stimulus of theory; that art had been the mother of science; the comely and busy mother of a daughter of a far loftier and serener beauty. But that when we considered how small an advance of speculative science was implied in each successful step of art, we shall be in no danger of forming any extravagant estimate of what man has done or can do.

Professor Forbes this year in his programme said, that the Association was not to be confounded with those numerous institutions which exist simply for the *diffusion* of knowledge; *extension*, or *accumulation* is its object; so that when to the eye of the world the members are apparently torpid during the intervals of their annual meetings, they are labouring to give an impulse to every part of the scientific system, maturing scientific enterprise, and directing the labours requisite for discovery:—

"If we now turn from the professions to the *acts* of the Association, we shall find gratifying proof that these sanguine anticipations were not chimerical; and that this primary machinery, not destined itself to do the work desired, but to construct the *tools* requisite for its performance, was wanting neither in efficiency nor in permanence. The first and most signal proof which we can cite, is the production of those reports on the progress of science, which appeared to the founder of the Association one of the most important objects of such an institution, and one which, beyond all dispute, no existing society could have attempted. The second volume of reports has amply justified the expectations with which it was hailed; and whilst the first was chiefly occupied with reports upon great and leading divisions of science, we have here several happy specimens of a still greater division of labour, by the discussion within

moderate limits of some particular provinces. Thus Mr. Taylor has treated of one particular and most interesting question in geology—the formation of mineral veins—one of the most important, in a theoretical point of view, which could have been stated, and which, from its intimate connection with commercial speculation, might have been expected in a country like ours to have been more specifically treated of than it has been. It strictly belongs to the dynamics of the science, to which, since the time of Hutton, but little attention has been paid until very recently. By the exertions, however, of Mr. Carne, of Dr. Boase, and Mr. Henwood of Cornwall, whose researches are to form one point of discussion in the geological section at the present meeting, that electric agency was concerned in the disposition of metalliferous veins can scarcely be doubted, and the connection between electricity and magnetism, now so fully established—the connection between metalliferous veins and lines of elevation, and between the latter and the isodynamical lines of terrestrial magnetic intensity, as suggested by Professor Necker of Geneva—point out a bond of union between this subject and that of terrestrial magnetism, on which we have a report by Mr. Christie, where the very interesting direct observations of Mr. Fox of Falmouth, on the electro-magnetic action of mineral veins, are particularly noticed. Mr. Christie's theory of the diurnal variation of the needle, which he is desirous should be submitted to the test of a laboratory experiment, is likewise intimately connected with the actual constitution of our globe. The whole subject of terrestrial magnetism is one of the most interesting and progressive of the experimental sciences. The determination of the *direction* of the magnetic energy by means of two spherical co-ordinates, termed the variation and the dip, and the measure of the *intensity* of that force, are the great objects of immediate research, as forming a basis of theory. The existence of four points on the earth's surface, to which the needle tends, has long been known; and the position of two of these (in Northern Asia and America), has recently been elucidated by the persevering efforts of Professor Hanstein and Commander Ross. The precise numerical determination of the elements just alluded to, acquires a deep and peculiar interest from the multiplied variations which they undergo. Not only are these elements subject to abrupt and capricious changes, which Baron Humboldt has termed *magnetic storms*, but gradual and progressive variations are undergone at different hours of the day, at different seasons of the year, and throughout longer periods, which may even perhaps bear a comparison with the sublime cycles of astronomy. Natural history forms a more prominent subject in this volume than in the last, though the reports of Professor Lindley "on the principal questions at present debated in the Philosophy of Botany," and of Dr. Charles Henry, "on the Philosophy of the Nervous System," refer only to particular departments of widely extended subjects, which are again to be resumed in more general reports, undertaken for the present meeting—that by Mr. Bentham, on systematic botany, and by Dr. Clarke, of Cambridge, on physiology in general.

"We cannot but remark with pleasure, that one of the points for enquiry particularly insisted on by Professor Lindley, that of the influence of the chemical nature of soils, and of the excretions of plants, was taken up at an early period of the existence of the Association, by one of its most zealous supporters, Dr. Daubeny; and that, in reference to the review by Dr. Henry, of the labours of European physiologists, we may quote, as a national honour, the discoveries of our distinguished associate, Sir Charles Bell.

"On the general connection and occasional apparent opposition of *Theory* and *Practice*, I would refer to some very pertinent remarks in the address of Mr. Whewell, at the last meeting. The importance of carrying on both simultaneously and independently, and of looking to our increased knowledge of both as the only sure means of ultimately reconciling discrepancies, has been manifested by the desire of the council of the Association to procure two distinct reports on the Theory and Practice of Hydraulics, which have been drawn up with remarkable perspicuity, and within a small compass, by Mr. Challis and Mr. Rennie; both these gentlemen have shown their zeal in the objects of the Association, by promising to continue their valuable labours. Mr. Rennie, on that part of his subject which relates to the motion of fluids in open channels, and Mr. Challis, on some of those exceedingly interesting branches of theory altogether modern, which physically, as well as in their mathematical methods, have the closest analogy to that case of the motion of the fluids treated of in the present volume, namely, the Theory of Sound, and the intimate constitution of liquids. When, in addition to these reports, we shall have received that undertaken by Mr. Whewell upon the mathematical theory of Magnetism, Electricity, and Heat, we shall undoubtedly possess the most complete outline extant, of a department of knowledge entirely of recent date. In the science of Hydraulics, indeed, some progress in theory has accompanied the increase of practical information, at least since the time of Newton, but in the other strictly *practical* report of the present volume, that of Mr. Barlow, on the very interesting subject of the strength of materials, little or nothing has been done of much theoretical importance since the days of Galileo. Circumstances, which it would be easy to point out, prevent our setting out, except in rare cases, from unimpeachable data; but several very interesting conclusions of general application are derivable from well-conducted experiments, and the Association may claim some credit for having brought into general notice the ingenious investigations of Mr. Hodgkinson of Manchester. One report, and that the longest which has ever been printed by the Association remains to be mentioned;—it is by Mr. Peacock, on the present state of Mathematics. When we consider the vast extent of the subject, and the extremely limited number of persons, even in the whole of Europe, capable of undertaking it, we must consider the production of a work of so much labour as the present, which, as yet, is incomplete, but which the author has promised to resume, as the best trophy to which we can refer in proof of the entire efficiency of the Association. Were these annual reports the only fruits of the labours of this society, there would be no reason to complain. But yet more specific results of its impulsive action on science may be quoted.

"The questions suggested by the reporters and others, recommended for investigation, have met with ready attention from several individuals capable of satisfactorily treating them. Professor Airy has himself investigated, from direct observation, the mass of Jupiter, suggested as a desideratum in his report on Astronomy; and, since the last meeting of the Association, has confirmed his first results by new observations, which give almost the same mass by the observed elongations of the satellites, as had been deduced from the perturbations of the small planets by Jupiter. Hourly observations of the thermometer in the south of England have, in two instances, been commenced; and we are assured that the same desirable object is about to be attained by the zeal of the committee in India, where the Association has established a flourishing colony. A series of the best observations, conducted for ascertaining the law which regulates the fall of rain at different heights, has been undertaken at the suggestion of the Physical Section, by Messrs. Philip and Gray, of York, which have been ably discussed by the former gentleman, in last year's report, and have since been continued.

"A regular system of auroral observation, extending from the Shetland Isles to the Land's-end, has been

established under the superintendence of a special committee, and specimens of the results have been published. Observations on the supposed influence of the aurora on the magnetic needle, have likewise been pursued in consequence of this proceeding. The conditions of terrestrial magnetism in Ireland have been experimentally investigated by Professor Lloyd. An important enquiry into the law of Isomorphism has been undertaken by a special committee, which has likewise reported progress; and an elaborate synopsis of the whole Fossil Organic Remains found in Britain is in progress, under the hands of Professor Phillips. Many specific enquiries are besides going forward, under particular individuals, to whom they were confided; whilst it is not to be doubted that numberless persons, many of them perhaps new to the world of science, are at this moment pursuing investigations recommended in general terms in one or other of the publications of the society. To others the Association has not scrupled to commit a portion of the funds at their disposal, for the purpose of pursuing objects which required an outlay that might be deemed unreasonable by individuals. Among the most important of these is the collection of the Numerical Constants of Nature and Art, which are of perpetual recurrence in physical enquiries, and which has been confided to the superintendence of Mr. Babbage. When objects of still more peculiar national importance presented themselves, the Association has fulfilled its pledge, of stimulating government to the aid of science. Five hundred pounds have been advanced by the lords of the treasury towards the reduction of the Greenwich Observations, at the instance of the Association; and more recently the observations recommended by the Committee on Tides have been undertaken by order of the Lords of the Admiralty, at above 500 stations on the coast of Britain. Individuals, as we have said, have been stimulated by the influence of the Association, but so may nations and great bodies of men. Its published proceedings have found their way into every quarter, and are tending to produce corresponding efforts in distant lands. Our reports on science have produced some very interesting counterparts in the literary town of Geneva. America has taken the lead in several departments of experiment recommended by the Association; and the instructions for conducting uniform systems of observation have been reprinted and circulated in the New World. We must likewise consider it as an especial proof of the influence and importance of the Association, that a report on the Progress of American Geology has been undertaken and executed by Professor Rogers of Philadelphia. Similar contributions from some other foreign countries have been promised, which will extend the utility of the Association, by making us acquainted with the more characteristic state of science in the various parts of Europe. Nor can we fail, on the present occasion, to consider as a most auspicious promise of the future success of the Association, that the distinguished Secretary of the Institute of France has not only honoured this meeting by his presence, but has promised to interest that powerful body on behalf of the important objects contemplated by the Association, which its co-operation might effectually secure. The formation of a Statistical Section at Cambridge was the prelude to the establishment of a flourishing society, which acknowledges itself the offspring of this institution, and which promises by a procedure similar to that introduced by the Association, to advance materially the greatly neglected subject of British Statistics."

Professor Sedgwick was chairman of the Cambridge meeting, and Sir Thomas Brisbane of that at Edinburgh. After the long extract just given, which embraces a notice of the most important subjects discussed on the two occasions, we must now confine ourselves to some only of those which can, from their popular nature, be conveniently introduced here.

In the statistical section Mr. Heywood gave an account of 4,102 families of operatives in Manchester. The numbers in each family were on the average five, which is low, because the common one is six and a half. They resided in 3,100 houses, 752 cellars, and 250 rooms. About 600 of these residences were respectable, and about 1,200 ordinarily comfortable: but more than one half were dirty and destitute. There were 8,821 children under the age of twelve, of whom only 252 attended day schools; 4,680 received instruction at Sunday schools, and nearly one half were entirely destitute of education. The number of parents who could read amounted to 3,114: of these families 2,021 belonged to the established church; 1,473 were Roman catholics, 591 were dissenters, and 17 declared that they had no religion. The small number that attended day schools was noticed as a lamentable instance of the little that has yet been effected for the moral improvement of England. It was also stated that the education received at these schools was miserable in amount, and bad in quality. Respecting Sunday schools it was said, that they had produced most beneficial effects both on the children and on the parents. This re-action upon the parents is a most interesting fact. The Rev. E. Stanley, of Cheshire, stated that he knew of no instance in which the children of poor or profligate parents, if regular attendants at our schools, had not transmitted to their homes a portion of the benefit derived. Indeed, we have no right to argue from occasional disappointment, that education is either useless or impolitic. How profligate and barbarous would have been the population of our manufacturing districts, had not the dark scene been enlightened by here and there a ray of intellectual light, and the whole more or less soothed, and in some degree controlled, by the civilising powers of revealed religion.

Mr. Whewel delivered a lecture on several interesting phenomena connected with the tides. He observed, that the state of information with respect to tides, amongst philosophers, was in the same situation as that with respect to the general principles of astronomy among those who were the least learned. The general fact of tides being governed by the law of gravitation and the attraction of the moon and the sun was known to the learned, but of the particulars they were in a great measure ignorant. At the previous meeting he therefore called upon intelligent individuals to institute investigations upon the subject, and at Bristol, a society had been formed with the view of carrying on these enquiries. The rise and fall of the tide averaged at that place from fifty to sixty feet. To facilitate such investigations, a self-registering instrument was constructed to ascertain the rate of the rise and fall of the tides; by this, the relative altitudes at different times of high water were delineated on a sheet of paper, one of which was exhibited to the meeting. By this means the fact was proved, that at one period of the year the evening tides were greater than the morning, and at other periods the morning tides were greater than the evening ones. This

was a thing which could not be observed at London, because the peculiar position of that city was singular, and he believed unique in the tides of the coast. He then showed that the great tidal wave of the Atlantic, in approaching the shores of England, divided into three columns, and that two of them met exactly at the mouth of the Thames, one of these twelve hours after the other, so that each tide was compounded of an evening and a morning tide, and in consequence there was no alteration in the daily tides of that port. With the view of prosecuting the investigation of these phenomena, application had been made to the Admiralty, to direct the Coast Guard Service to make observations on the subject; and the officers of that service had shown great alacrity and zeal in the undertaking. He had received these observations from the 7th to the 23d of June last, but had not yet had time to examine them fully; but from a cursory glance they appeared to be of great value, and they were at present undergoing examination by direction of the Admiralty.

Professor Stevelley, of Belfast, read a paper, attempting to connect some of the most commonly known phenomena in meteorology, with well established physical principles. First, as to the nature and origin of clouds, and the consequences which, by the laws of physics, are immediately consecutive upon their formation. Secondly, how rain is originated, and the immediate consequences of its production. Thirdly, the origin of wind, in the forms of the breeze, the gale, the storm, up to the sweeping tornado. He maintained that clouds were assemblages of spherules of water, in opposition to the common hypothesis that they are vesicles, or as it were, bladders of watery films, containing moist air, having a tendency to buoy them up. One of his arguments was, that no physical law had ever been proved to exist, that would account for the production of vesicular constituents of clouds; but the well-established laws of capillary attraction would account for the production of minute spherules of water, at pretty regular distances, in any portion of space, which has become so overloaded with vapour of water (and this indeed is nothing but steam) as to be incapable of retaining it longer; it is to be remarked that the intermediate parts are then left hygrometrically drier than before. The minute size of the cloudy spherules would alone be sufficient practically to suspend them, as even gold or platina may be so subdivided as to descend with less than any assigned velocity through the resisting air; for the weight of a sphere diminishes as the cube of its radius is diminished; but the resistance it would meet with at any assigned velocity, would only diminish as the square of the same radius. Also, as clouds are known to be highly electrical, each spherule must have its own electrical atmosphere, which, by repelling the dry air all around, (as pith balls repel each other,) in effect increases the size of the drop, without adding any thing to its weight. The effect of the formation of clouds was then traced; one out of many was stated to be an augmentation, often to a great extent, of the electrical tension of the cloudy parts, and this was simply explained on the common electrical principles, particularly the one, that an electrified body, if diminished in bulk, had its electrical tension increased. He then showed how, on the principle of *electrical induction*, oppositely electrified clouds resulted from the near approach of two clouds to one another, but principally from the approach of masses of clouds to hills or mountains, to which they seemed to attach themselves, while their outer parts frequently sent off oppositely electrified scud or cumulus.

This brought him to the *formation of rain*, which was shown to result from clouds charged with opposite electricities coming together, each spherule of one running to a spherule or more of the other: they suddenly coalesce by capillary attraction, form a larger sphere, and, as the case may be, either descend lower in the atmosphere as heavier cloud, or if the spherules formed become as large as drops, they descend as rain, with a velocity proportioned to their size, and the height at which they had been formed. On the production of *wind*, he did not stop to trace the effect of the sun, volcanic fires, or other sources of external heat, in disturbing the atmospheric equilibrium.

The efficacy of the formation of clouds in the production of wind, and also the manner in which a fall of rain gave rise to all its various forms, were points on which he dwelt. The last thing treated of was the formation of *hail*, which he showed must be formed when, after the fall of some rain, a sudden and extensive vacuum being caused, the quantity of caloric abstracted was so large as to cause the rest of the drops to freeze into ice-balls as they formed. This principle he said had been strangely overlooked, although, since the days of Sir John Leslie, every person was familiar with experiments on a small scale illustrative of it. He also said that the interesting mine of Chemnitz, in Hungary, afforded an experimental exhibition of the formation of hail, on a magnificent scale. In that mine, the drainage of water is raised by an engine, in which common air is violently compressed in a large cast-iron vessel. While the air is in a state of high compression, a workman desires the visiter to hold his hat before a cock which he turns; the compressed air, as it rushes out over the surface of the water within, brings out some with it, which is frozen into ice-bolts by the cold generated by the air as it expands; and these shoot through the hat, to the no small annoyance of one party, but to the infinite amusement of the other.

Such were some of the more popular and least technical subjects discussed and elucidated at the fourth meeting of the British Association held at Edinburgh. But we could do no more than merely skim over, or touch upon these; and must leave the scientific reader, after saying that the strongest expressions of approbation and admiration we have in our vocabulary are not too much in describing its greatness and growing importance as well as past achievements. The report of the third meeting has been published by the society: that of the fourth, and of all succeeding meetings, will of course follow; which, if we are to judge from that which has been done, will take their place by the side of the most curious and valuable transactions that have ever been published by any public body.

TRICKS UPON TRAVELLERS.

A YANKEE TRICK.

It was a time of great bustle and expectation in the little village of L——, situated "somewhere out of the world and up in the woods," in the state of Massachusetts. There was to be a special frolic in the shape of a horse-race—a horse-race, do I say? I mean a scramble of quadrupeds, for since the practice had been known there, very few of the animals that put their hoofs in would have been entitled to the name and honours of a horse at Doncaster. Four-footed animals they were for the most part, though some of them kept the fourth in reserve, and chose to go upon three—Narraganset pacers, Vermont shamblers, Berkshire blunderers, Connecticut caperers, Worcester plough-joggers, Dogtown dumpies,—in short, the tag-rag and bob-tail of the four-footed creation; not that Yankee-land is deficient in prime horse-flesh, witness the Tom Thumb the Great, or the steeds of the mail stages, if you have been in that country; or the progeny of that celebrated mare whom a flash of lightning chased all round a ten-acre lot, without being able to catch her. But horse-racing is no regular trade or common occupation in New England; nobody makes a business of rearing animals for the turf; and when an occurrence of this sort takes place, it is no very studied affair, but a frolicsome scramble among all the beasts of burden in the neighbourhood, or such as chance brings along at the moment.

Once a year it had been customary to run a race of this sort in the village of L——, and the fleetest runner of this motley multitude won a prize of some value, to which every adventurer contributed a sum. On the present occasion the prize was considerably augmented by an offer from an individual who had constituted himself a society for the promotion of horse-racing, and more than common interest was of course excited at the approach of the festival. The old farmers who had horses fit for running, gave them extra quantities of corn and fewer applications of the lash, as if to be fat and fleet were the same thing. Some, however, were more cautious in their preparations, and, among the rest, Job Hawker, a sly, calculating, guessing, questioning, bargaining, swapping, Jack-of-all-trades sort of a chap, long-sided and limber-tongued, with a face as grave as a deacon, but a roguish twinkle of the eye on occasion, that gave you assurance he was no greenhorn. Job's horse had beaten them all hollow the former year, and he was in full confidence of the same good fortune this time. Howbeit, he took all imaginable precautions to secure success, and put his steed only to that quantum of exercise and fodder which he judged conducive to speed.

But while he was flattering himself with the prospect of a certain victory, and as the day of trial approached, he was thrown into consternation by the arrival of a stranger, mounted on a Canadian pony, who came with the avowed intention of putting in for the prize. At the first announcement of this intelligence, Job fell into despair, for it so happened that he knew the individual, having encountered him in the northern part of Vermont, while on a trading excursion in that quarter. Job had witnessed a trial of speed which the pony exhibited there, and knew that his own Bucephalus was no match for him. It was plain that if the Canadian took a share in the race, he must win, and the catastrophe seemed inevitable, for nobody had a right to exclude him. It was a grievous thing for Job to think of having the prize snatched from before his eyes, when it had been augmented to a double value, and just at the moment when he imagined it within his grasp. Job had not all the patience of his namesake of old, as evinced by his conduct in this emergency. He did not sit down and curse the day he was born, giving up the whole concern for a bad bargain, but he sat down upon a log of wood and scratched his head. This sage manœuvre was practised for the purpose of devising by what art, stratagem, cunning device, or quizzical circumvention, he might get rid of this formidable rival. His first thought was to inveigle him into a *swap*, but that would require a great deal of palavering and chaffering, and must prove a long job—too long for what little time remained. He then thought of buying him off from the enterprise, giving him a bird in the hand for two in the bush; but this would cost too much, and Job was resolved to have the whole or none. His third project was to frighten or obstruct the pony by some preconcerted accident, just at the time of setting out; but this did not appear, on consideration, to be a safe proceeding. Various other tricks suggested themselves, but no one seemed to be just the thing. Evening drew on—the next morning was to bring all parties upon the turf—and there was not a moment to be lost. Job had cudgeled his brain for two hours to no purpose; he started up in a great puzzle, and began to wend his way homeward. As he reached the little green in front of the meeting-house, he heard a loud huzzaing; he looked up, and beheld a crowd of people following a fat ox, with a flag upon his horns. At this instant a thought struck him; he did not shout *Eureka*, but it was because he knew no Greek. Early the next morning, on that hint he acted. He clapped his military hat upon his head, (Job was a lieutenant,) and waited upon the Canadian.

"Well, I suppose, squire, you are the gentleman with the pony?"

"Yes, sir."

"Ah, I guessed as much. Well, I suppose you are a thinkin' o' racin' to-day?"

"Yes, if it is according to rule."

"Sartin! It's all accordin' to rule, if in case you have tried to beat the beater."

"Beat the beater!"

"Yes, beat the beater; you know what that is, I take it."

"No, hang me if I do."

"Well, that's a good 'un; but I guessed as much. You see the case is exactly this: I beat the last races, and you, being a new comer, must give your horse a trial with me before you can enter for the race."

"Oh, if that is all, I am content; bring out your horse, and let us try as quick as you please."

"Your horse!" exclaimed Job, with well-feigned surprise.

"Yes, your horse; you don't mean a foot-race, sure!"

"Why, squire! don't you know?"

"Know what?"

"Know what? why it is my *ox* that is to race, and not a horse!"

"An ox!" cried the Canadian, staring with all the eyes in his head.

"Yes, an ox," returned Job, with imperturbable gravity. "Why I thought you knew all about it."

"About what?"

"About racin' to be sure. Did you never hear of my ox that beats all creation?"

"No!" exclaimed the Canadian, in the greatest astonishment.

"Why, didn't you see him about town yesterday?"

The man was thunderstruck; he had seen the ox, and this strange announcement made him believe what he had always been told, that Yankees were born devils. "I have beaten horses," thought he, "but never tried with an ox." Job kept on a grave face.

"My ox is all saddled and bridled," said Job; "are you ready?"

"I think I won't try this time," replied the man, hurrying away with a most desponding look. He ordered his pony to be got ready, paid his bill, and mounted to set off. The landlord stared.

"Why, you mean to stay and try the race today, don't you?"

"No, no," replied he, shrugging his shoulders and shaking his head. "I'll run my pony against any horse, but there is no knowing what a cursed ox *may* do."

Job bore away the prize that year, and the stranger never came again to disturb him; but his last words are still a common saying in the town of L——; and whenever a horned beast gets antic, he is specially impounded with the remark, "There is no knowing what a cursed ox *may* do."

—

A FRENCHMAN'S TRICK.

Monsieur Duphot was a French refugee who had fled to America in the beginning of the revolution, and settled himself in Boston. His judgment of the Yankees was expressed without reserve—"Ils sont bons enfans, mais ils ne savant pas jouer le violon." But Monsieur Duphot had a waggish neighbour, who, if he could not play the fiddle, could play a trick, as the Frenchman found to his annoyance, having been April-fooled and sent on errands after pigeon's milk more times than once by this mischief-loving fellow. He would have paid him in his own coin, but his bad English was sure to carry him into some blunder in the attempt, and the jokes which he plotted commonly exploded on his own hands. However, good luck and his own wit made him amends, now and then. One day, Mr. B——, the joker aforesaid, met him in the market, where the Frenchman was cheapening a quarter of mutton.

"Ah, monsieur," said he, "you and I are on the same errand. You dine on mutton to-day?"

"Yes sair; de muttons is more sheap as de bif, *voyez vous*."

"True, and if you and I buy a bit together, it will be cheaper still. What do you say?"

"Ver well, *allons;* let us see—how moch you vant?"

"Oh, about a quarter."

"*Bien, bien*, and so do I. Den me buy half a mutton *ensemble*, and den me make him two half *chacun* a piece."

"Exactly," replied B——.

So straightway making a purchase of a side of mutton he cut it in two, and taking the hind quarter for himself, offered the Frenchman the other.

"*Attendez l*" said the Frenchman; it is de hind quarter I want."

"Really! now it happens to be the very part I want too!" said the other, pretending surprise.

The Frenchman grinned, and shrugged his shoulders.

"Come," said B——, "let us toss a cent, and he that wins shall put his hand upon one piece, and say, "Who shall have this? while the other turns his back, and answers I or you."

"Ver well."

"Here it goes then; head, I win—tail, you lose."

The former proposition was uttered, as the coin flew into the air. "Aye," said the Frenchman to it, and "No," to the latter, for he had been tricked that way before. Mr. B—— was caught in his own trap, for it was not a head. "However, 'tis an equal chance yet," thought he.

"*Tournez donc*," said the Frenchman; and slily whipping out his penknife he chopped off the tail from the one portion of the mutton, and clapping it upon the other, cried out, as if in his usual blundering way,

"Who shall have dis wid de tail on?"

"I!" replied the other, jumping round in great glee at the supposed *etourderie* of his companion.

"Den you take him, de fore quarter."

Mr. B—— scratched his head, without saying a word, for a moment or two, till the explosion of laughter which accompanied the trick had in some degree subsided. Then, with an exceedingly foolish look, he marched away, carrying his fore quarter of mutton with the tail on, which winds this tale off.

SHAKSPEARE.—Some very patient and industrious idler, who possesses more ingenuity than the world will give him credit for, has amused himself with fabricating a pretended account of the "*Citation and Examination of William Shakspeare*" and others, before Sir Thomas Lucy, on the charge of deer-stealing; supposed to have been taken down at the time by the justice's clerk. The fiction is very transparent: the affectation of quaint phraseology is clumsy; the imitations of Shakspeare's verse are unlike both in turn of thought and expression; the attempts at wit are strained and feeble; and the whole is so dull and tedious as to be unreadable.

From the London Athenæum.

ASCENT TO THE SUMMIT OF THE POPOCATEPETL.

[The following interesting narrative is translated from a letter addressed by Baron Gros, Chief Secretary to the French Legation in Mexico, to a friend at Paris.]

MEXICO, 15th May, 1834.

The valley of Mexico is one of the most picturesque in the world; it is bounded on the S.S.E. by a range of mountains, from which two volcanoes rise up, known by the Indian names of Iztaciuhatl and Popocatepetl. Their peaks, always covered with snow, are at sixteen and eighteen thousand English feet above the level of the sea. The crest of the former, the nearer to Mexico, runs from N.W. to S.E., and is irregularly rent. The latter is a perfect cone. It somewhat resembles Mount Etna, but does not, like that mountain, rise from a plain. The Popocatepetl is on the side of the platform of the Cordilleras Mountains. On one side, the N.W., the forests of firs which surround it terminate at the foot of the valley, and the last trees are mingled with the wheat, Indian corn, and such other European plants as grow at that height; but, towards the S.E. the forests continue farther down. They, however, become gradually thinner, very soon disappear altogether, and are superseded by the sugar-cane, the cochineal tree, and all the rich and varied vegetation of tropical regions. A traveller, by starting from the volcanic sands, a little above the boundary of vegetation, and coming down in a straight line into the valley of Cuautla-Amilpas, would, in a few hours, have gone through all climates, and could gather all the plants which grow between the pole and the equator.

It follows from this, that the snow which is on the S.E. side, must in certain cases be influenced by the breezes of warm air, which constantly rise up from the valley of Cuautia. The snow partly melts in the dry season, and whilst the north of the volcanic cone is perpetually covered with snow and ice down to the firs nearest to the top of the volcano, the lava and porphyry on the south side are bare.

This, therefore, is the side on which to look for a passage when wishing to ascend to the summit of this mountain, the highest in North America. I tried it last year with a different result.

You know how my first attempt proved unsuccessful. M. de Gerolt and myself were overtaken by one of those tropical storms, of which in Europe you can form no idea. It became indispensable to pass the night amongst the wet firs which grow on the brink of the sands; we had but a cloth stretched with cords over a tree half thrown down, to shelter us from the rain, the hail, and the snow, and we considered ourselves fortunate in having thought of wrapping up our clothes, for a change, in the cloth which was destined to be so useful to us. You have probably not forgotten the storm over our heads, and that which rent the trees below us, and those horizontal flashes of lightning which produced so disagreeable an effect upon my travelling companion; and then our six hours' idle walk in the snow, after having been abandoned by our guides, and our blindness for several days, brought on by the reflection of the sun, and our fatigues, our sufferings, our want of courage, the loss of strength, and in fine, the painful necessity of giving up our enterprise, when we had but twelve or thirteen hundred feet to climb before arriving at the summit, the promised land.

This year we have met with nothing of the kind; we have had a run of the most favourable circumstances. We profited by the experience of last year, and the 20th April at thirty-seven minutes after two in the afternoon, I planted on the highest peak of the Mexican Andes a flag, which had never floated on so high a spot before.

We had finished all our preparations in the beginning of April; we had barometers, a miner's compass, for want of a theodolite, which is too heavy to be carried up to such a height, some thermometers, one of those little *œolipiles* by Breuzin for heating water, a good telescope, and a hygroscope. All these instruments had been compared with those here, belonging to General D. Juan de Orlegozo, and to Professor D. Joaquim Velasquez de Leon, in order to enable us on our return to compare the results of the experiments made at the same hour by those gentlemen in Mexico, and by us whilst on our journey. I had had a tent made for shelter; and we were supplied with hatchets, saws, ropes, and iron-shod bamboos: these latter are indispensable in expeditions of this nature; mine was fifteen feet long, and I intended to leave it behind us on the top of the volcano. I took good care not to communicate this project to my companions; it was possible we might fail in our expedition, and I did not wish to sell the lion's skin before I had killed the lion.

On the morning of the 15th we started; we had with us three Mexican servants, and three dragoons—we each had a second horse and a mule of burthen. In two days we reached Zacualpam-Amilpas, where Mr. Egerton, an English painter, who was to be of the party, soon joined us. We had planned to remain at this place until the time should seem most opportune for making the attempt.

Whilst waiting for the so much wished-for opportunity, I spent my time in carefully examining, with the aid of a telescope, the summit of the volcano, and I made drawings, as accurately as possible, of the rocks, the ravines, and the courses of the lava which are on this side. We then searched on the paper for the direction which promised the most success, for we well knew the guides would leave us the instant we reached the perpetual snow.

At length, on the 27th, we commenced our march, and reached Ozumba at three in the afternoon. We sent for the same guides we had made use of last year. They are Indians of the village of Atlautia; which is at the very foot of the Popocatepetl: we took three. We laid in provisions for four days, and the next morning by seven o'clock we had begun, with our mules and horses, to ascend the mountain. At one o'clock we arrived at the Vaqueria, a veritable Swiss *chalet*, which is used as a shelter by the keepers of a numerous herd of cows, and is the last inhabited

spot on the mountain. At three o'clock we arrived at the point where vegetation ceases: this we did by ways which might almost be said to be beaten, for we had occasion but once to make use of our hatchets. As you are acquainted with the Alps, I have nothing to say on those admirable forests of oak, of firs, and of larch, which we passed through. They resemble each other in both hemispheres except that at the foot of these there are large flocks of *guacamaias*, (a large green parrot with a red head,) which are not to be met with at Chamouny or at Sallenches. There are also in the forest lions of a small species, *jaguars*, wolves, deer, and a great number of wild cats, but we did not see a single one of these animals.

As you get higher up in the wood, the fir trees become scarcer, and of less size. Near the sands they may be said to be dwarfs, and all the branches are bent downwards, as if seeking below a less rarefied air. After these firs, for the most part lying down and nearly rotten, you meet but with some tufts of a sort of currant-tree, with black fruit: and then here and there clumps of a yellowish moss, which grows in a half circle in the midst of scattered pumice-stone, lava, and basalts —in short, there is no longer any vegetation, and I did not even see lichen on the rocks. One then begins to feel that one is in a sphere wherein it is not possible to live. Respiration is difficult: a certain melancholy, which is not without its agreeableness, comes over you; but, in truth, I cannot exactly define the sensations I experienced when entering these deserts.

The instant you have left the wood, about one third the height of the volcanic cone, you see only an immense extent of purple sand, which is in some parts so extremely fine, that it is blown by the wind into the most perfect ridges. Blocks of porphyry, scattered here and there, break in upon the monotony of the scene. The top of the undulations in the sand is crowned with numerous little pumice-stones of a yellowish colour, which seem to have been heaped up by the wind. In short, from the summit of some of the volcanic rocks, masses of porphyry and black lava descend, intersecting the ridges of sand, and lose themselves in the forest. The highest part of the volcano is completely covered with snow, and this snow has a so much more brilliant effect that the sky is of a blue almost black. A few footsteps of wolves and jaguars were visible on the sands near the wood.

After having for a short time admired this sad and singular sight, we returned into the forest; the tent was pitched near to the prostrate tree where we last year passed so dreadful a night; fires were lighted, and, whilst our *mozos* were preparing our beds and repast, we endeavoured to get a little higher up, in order to accustom our lungs to breathe an air so little congenial to them.

We had returned by six o'clock. Fahrenheit's thermometer was at 50°. The barometer at 19.120 (English inches); water boiled at 90° of the centigrade thermometer. The humid zone of the hygroscope appeared at 36°, and disappeared at 37° of the interior thermometer, whilst the exterior marked 50°.

Having finished our experiments, we made our preparations for the next day. In the night we suffered from the cold.

On the 29th, at three o'clock in the morning, we started, with a fine moonlight, warmly clad, the face and eyes sheltered with green spectacles, and a gauze of the same colour, which wrapped up the whole of our heads. Of my flag I had made a belt. We were seven: the three guides already mentioned, M. Gerolt, the Prussian consul general, Mr. Egerton, an English artist, Luciano Lopez, his Mexican servant, and myself. We each of us had a little bag containing bread and a flask of sugar and water. The Indians carried our instruments, and some provisions. We walked behind each other, taking care to tread in the same steps as the foremost guide, in order to have firmer ground. Of course each man carried his iron-shod bamboo. We advanced very slowly, and were obliged to rest at about every fifteen paces to take breath. The sugar and water was of immense service, for, being obliged to keep the mouth open to breathe, the throat became parched, and a few drops of sugar and water every five minutes prevented the pain becoming unbearable. We zig-zagged and went sideways: the ascent is so steep, that it would have been dangerous, and next to impossible, to have gone up in a straight line.

By the time the sun appeared above the horizon, we had reached a great height, when we observed a singular phenomenon, but such as has already been seen on the banks of the Rhine. The shadow of the whole of the volcano was completely visible on the atmosphere. It was an immense circle of shade, through which we could see the whole country to the horizon, and which rose afterwards far above it, terminating by a vapour moving from south to north, the circle descending and becoming more and more transparent as the sun rose, and in about two or three minutes it was entirely dispersed.

At nine o'clock we reached the celebrated Pico del Fraile, beyond which we could not get last year. Our names, which we then imprinted with a hammer, remained perfect, only the first letters, towards the west, were become of a clear yellow colour.

This peak is a pile of reddish circular rocks, such as is to be found on one of the crests which runs down from the summit. Its perpendicular height is from eighty to one hundred feet, the diameter is about fifty. It terminates in a point, and is distinctly visible from Mexico.

Our guides had consented to go thus far, but nothing could induce them to go farther. I do not think they were more tired than we were, but certainly they were under the influence of some superstitious fear.

Our way to the Pico was long and fatiguing, but not dangerous. We had not yet met with any snow, and it had not been necessary, as last year, to climb up with our hands. I felt less oppression than I had feared I should, and my pulse beat but 120 per minute. We were full of courage, had plenty of time before us, and the clearest sky.

We had planned to halt at the Pico del Fraile,

and to recruit our strength by a light breakfast. I thought it would be imprudent when at that elevation to eat much, or to drink spirituous liquors, for the nervous system is excited to an inconceivable degree. We, therefore, took no more than a little bread, and a little of the white meat of a fowl, with a glass of weak wine and water; and after one hour's rest at the foot of the Pico, we resumed our journey.

At nine o'clock the thermometer was at four centigrade degrees; the barometer at 16.472; water boiled at eighteen centigrade degrees. I did not make any hygrometrical observation. The sky was of a much darker blue than on the preceding day. Unfortunately, we had no instrument wherewith to measure its density.

At ten o'clock we were on our way without our guides, and, having to carry our instruments, we found them tremendously heavy.

It is necessary to pass in front of the Pico, and to turn round it on the right. After having got beyond the Fraile, there is, on the left, or rather on its prolongation, a crowning, which terminates at a mass of rocks which exfoliate like slate. They rise up to about 150 feet perpendicular. The summit is covered with snow, and long stagonites of ice fill up the crevices. There is no outlet on this side. On the right is a tolerably deep ravine, which, from afar, we had taken for the remains of a crater. It extends in a straight line from the top of the volcano to the nearest fir-trees, and is intersected with basalts of lava and porphyry, and, at particular places, is crossed by perpendicular walls of rock and immense heaps of snow; but it was easy to see that, by making some circuits, the summit of the volcano might be reached that way. We, therefore, went down into this hollow, and, without losing sight of one another, each took different roads; M. de Gerolt the middle; I walked on the left, and Mr. Egerton, with Luciano, between us. I thought mine to be the best path, but I was mistaken; I nearly broke my neck a hundred times; and, if I again undertake the journey, I shall go by the bottom of the ravine.

When we could get upon the snow, we walked with greater facility. It was furrowed by the wind and sun, and was like a fresh-ploughed field; and, as the furrows were parallel to the horizon, they served as steps. On the sands and rocks there was real danger, for the least inattention or false step would have been fatal. At twelve o'clock we had reached the summit of those perpendicular rocks I have before mentioned; but our strength was beginning to fail us, and, after every eight or ten steps, we were compelled to make a long rest to take breath, and to allow the circulation of the blood to quiet itself a little.

Though we were in the midst of snow, we felt no inconvenience from the cold, except when drinking, or when we touched the metal parts of our instruments. But it was necessary to call aloud to be heard at twenty paces; the air was indeed so rarefied at that height, that I tried in vain to whistle, and Mr. Egerton had the greatest difficulty in obtaining a sound from a small horn he had brought with him.

At half past two M. de Gerolt was on the highest point of the volcano. He skipped about with joy, and made me a sign indicating that there was an abyss at his feet. At thirty-seven minutes after two o'clock I had attained the summit, and I was on the highest edge of the crater. Here all my fatigues were over; breathing was no longer difficult; I was body and soul absorbed in the sight I had before me, and I felt a new life. I was in a state of supreme satisfaction, difficult to be described; and I also leaped in my turn, to encourage Mr. Egerton, who still had some awkward passes to get over.

The crater is an immense abyss, nearly round, bulging considerably to the north, and with some sinuosities to the south. It may be a *league* in circumference, and eight hundred or a thousand feet in perpendicular depth. Its edge is not horizontal; it lowers towards the east with sufficient steepness to create a difference of one hundred and fifty feet in the height of the two opposite points. Notwithstanding this, the diameter of the centre is so great, and the height at which it is so immense, that, from whatever part of the plain you look at the volcano, that part of the edge which presents itself to your view always appears to be the highest.

The walls of the abyss are perpendicular. Three large horizontal strata are perfectly visible, perpendicularly striped at almost equal distances by black and grayish lines. The bottom is a funnel formed by the detached parts which have from time to time fallen down, and which now do so daily. On the inside of the edge, down to fifteen or twenty feet, are layers, black, red, and whitish, very thin, supporting blocks of volcanic rock, which, however, fall occasionally into the crater. The bottom and the inclined plane of the funnel are covered with an immense quantity of blocks of pure sulphur. From the middle of this abyss, masses of white vapour ascend with great force, but disperse when about half way up the crater. Some also escape from openings in the slope of the funnel, and others from seven principal fissures, between the layers which form the very edge of the crater; but these do not rise to above fifteen or twenty feet.

The openings in the bottom are round, and surrounded by a circle of pure sulphur. There is no doubt that these vapours, which escape with so much force, must carry with them large quantities of sulphur in a state of sublimation, which are deposited on the stones and around the vent-holes. So much sulphurous acid gas escapes, that it was offensive to us on the summit. The exterior of the edge of the crater is free from snow; but within, on the side whereon the sun does not shine, there is a quantity of stagonites of ice down to the beginning of the third stratum. The highest summit of the volcano is a small platform of about twenty feet diameter, with some of that purple sand which is so abundant at the base of the cone.

You will easily feel how imposing such a sight must be. Such masses of lava, of porphyry, of red and black scoria, those whirlwinds of vapour, those stagonites, the sulphur, the snow; in short, this strange confusion of ice and fire which we

met with at eighteen thousand feet in the air, remarkably excited our imaginations. We should have liked to have gone all round, but we had not time, and I believe we had not sufficient strength.

At three o'clock the thermometer was at —1—4 centigrades. The moist belt of the hygroscope appeared at 34°, and disappeared at 33° of the interior Fahrenheit thermometer, whilst the exterior thermometer was at 40°.

In consequence of the violence of the wind we were unable to light the spirit-of-wine lamp for boiling water; but that which was much more unfortunate was, that in turning over the barometer for the purpose of running the quicksilver into the ball, some globules of air got into the tube: the instrument became comparatively useless.

If you read attentively the description I have given you of the volcano, you will, no doubt, be struck with two things. The first is the singular disposition of the apertures through which the vapours exhale. They are at the bottom, and in a circle; so that those yellowish walls, a thousand feet high, and of a league in circumference, appear as a screen to chimney flues conducting the vapour to the highest level of the ground. The second is the extraordinary coating of the interior of the crater. All those layers of lava, of sand, of stone, which form the mass of the volcano, are of the same nature on the outside as on the inside of the crater;—on the outside, however, all is black, purple, and red; whilst on the inside, a dirty white and yellowish hue prevails. There is therefore either a decomposition of the volcanic substances by the sulphurous gas, or a deposit of sulphur on the edges—perhaps both. We unfortunately could not get any of these whitish substances; and M. de Gerolt, who tried, was near paying dearly for his imprudence. He had descended by an inclined plane in one of the rents of the crater; but the sand was giving way under his feet, and he was sliding down towards the abyss, when he was fortunate enough to save himself with his iron-shod stick. It would, no doubt, have been magnificent to have had such a grave; but my traveling companion's ambition did not seem to extend so far.

If we were well agreed on this point, there was one on which we were not equally so. This was a strong and prolonged *noise*, which we heard at times from the interior of the volcano. We felt no motion, and nothing was thrown up from below. M. de Gerolt admitted that this noise was such as might be made by detached stones from the upper part of the crater falling down on the inclined plane which forms the bottom; now I twice *saw* blocks of a tolerable size detach themselves: I watched them as long as possible, and the noise we heard corresponded precisely with the shocks they met with in falling. I therefore think that the kind of lengthend detonations which occasionally occurred, proceeded from similar causes. M. de Gerolt spoke of subterranean action, and of the expansive force of the vapour. We were perhaps both right, for if, owing to causes easy to conceive, the stones were to obstruct the vent-holes, the vapour would not be long ere it would disengage itself with violence and *noise* from the obstacles opposed to its passage.

You have doubtless read in the histories of the Conquest, that Don Diego Ordaz, one of Cortes' officers, went up to the volcano for sulphur to make powder. There were perhaps at that time some fissures on the side of the mountain where it deposited itself, as is now to be seen in Italy. I do not think it is possible to get at that which is in the crater; and it is probable that in Fernand Cortes' time the volcano was more active than at present. There are millions of quintals of sulphur at the bottom of the funnel; the air is infected by the emanations. I have no doubt, that a person let down would be suffocated by the sulphurous vapour before having reached a depth of two hundred feet. Now, two hundred feet are not a fourth of the distance to the yellow masses which cover the bottom. Even supposing that one could breathe therein, the ropes required to go only to the nearest inclined plane would have to be of a prodigious length; and how are they to be got up to the top of the volcano, when it is so difficult to get there oneself, and that the least weight is almost an intolerable burthen? I am therefore of opinion, that if Diego Ordaz gathered sulphur on the Popocatepetl, it could only have been at a little above the volcanic sands, and not in the crater.

By half-past three we had terminated our experiments, made sketches, and fixed our flag on the highest point of the volcano. At four o'clock we were in the hollow way opposite the Pico del Fraile, where our guides were waiting for us. We made them a sign to return to the tent, and we continued to descend by a different route from that which we had ascended. At five we were on the borders of the wood. We observed several blocks of porphyry which had fallen recently from the summit: probably at the time of the earthquakes on the 13th and 15th of March. They had made a deep furrow from the top of the sands to midway down the mountain; but as the accelerated motion had caused them to rebound in rolling to the place where they were, their further progress was marked by deep holes made at each rebound. At six o'clock we were under the tent, but too tired and too much agitated to be able to sleep. When awake I spoke of the crater: and if I contrived to get to sleep, the oppression came on again, and I suddenly awoke.

The next morning, 30th April, at seven o'clock, the camp was broken up; at nine, we were at the Rancho, and at twelve, at Ozumba.

We collected a large quantity of plants and flowers in the forest: amongst others a shrub, which I think has not yet been described, nearly similar to our red laurel, but the flowers of which are like our lily of the valley, white clusters with a reddish hue.

In the court-yard of the house we lodged at, at Ozumba, I put up a telescope, looking on the summit of the volcano; and for two days this court-yard was filled with persons who came to take a view of our flag floating in the wind. By this means I gave an undeniable proof of what we had done,—a thing indispensable in a country where the people are not disposed, and for

ration I have assigned the widest limits to the kingdom; for there are provinces within this boundary which owe but a doubtful allegiance. The great feature of the country is the Oxus, which bisects the desert, and renders it inhabitable. The river of Samarcand, in its lower course, flows at right angles to it, but expends its water before paying its tribute to the greater stream. Another rivulet below that of Samarcand shares a like fate, after it has watered the province of Kurshee. On the banks of these different streams lies the whole cultivable soil of the kingdom. The entire country is comprised between the parallels of 36° and 45° of north latitude, and the meridians of 61° and 67° east longitude. A very small portion of this extensive tract is peopled. From Eljeek on the Oxus, and on the western frontier, to Juzzak on the east, which is the line of cultivation across the country, the distance is 240 miles. From Balkh to Bokhara it is but 260, almost altogether waste; and the desert commences about fifteen miles beyond the capital.

"Bokhara has a population of 150,000 souls; for there is scarcely a garden or burying ground within the city walls. With the exception of its public buildings, most of its houses are small, and of a single story; yet there are many superior dwellings in this city. We saw some of them neatly painted with stuccoed walls; others had Gothic arches, set off with gilding and lapis lazuli, and the apartments were both elegant and comfortable. The common houses are built of sun-dried bricks on a framework of wood, and are all flat-roofed. A house in an eastern city commands no prospect, for it is surrounded with high walls on every side. The greatest of the public buildings is a mosque, which occupies a square of 300 feet, and has a dome that rises to about a third of that height. It is covered with enameled tiles of an azure blue colour, and has a costly appearance. It is a place of some antiquity, since its cupola, which once was shaken by an earthquake, was repaired by the renowned Timour. Attached to this mosque is a lofty minaret, raised in the 542d year of the Hejira. It is built of bricks, which have been distributed in most ingenious patterns. Criminals are thrown from this tower; and no one but the chief priest may ever ascend it, (and that only on Friday, to summon the people to prayers,) lest he might overlook the women's apartments of the houses in the city. The handsomest building of Bokhara is a college of the King Abdoolla. The sentences of the Koran which are written over a lofty arch, under which is the entrance, exceed the size of two feet, and are delineated on the same beautiful enamel. Most of the domes of the city are thus adorned, and their tops are covered by nests of the "luglug," a kind of crane, and a bird of passage that frequents this country, and is considered lucky by the people.

"Bokhara would not appear to have been a large city in ancient times. Its remoteness from all other parts of the Mahomedan world has given it a celebrity, and besides, it was one of the earliest conquests of the caliphs. It may be readily imagined that the numerous offspring of the first commanders of the faithful would seek for distinction in its distant and luxuriant groves. Its name was widely spread by the number of learned and religious men it produced; and the affix of 'Shureef,' or holy, was soon added to it by its Mahommedan conquerors. It is considered the sure mark of an infidel, to say that the walls of Bokhara are crooked; but strange to add, the architecture is so defective, that I doubt if there be a perpendicular wall in the city. The priests of the present day assert that, in all other parts of the globe, light *descends* upon earth; but, on the other hand, it *ascends* from the holy Bokhara!"

Mr. Burnes has rendered several services to geography, and, with respect to the controverted question of the Oxus, he says:—

"I will not permit the much-disputed subject of the Oxus having terminated, at a former period, in the Caspian instead of the Aral sea, to lead me into a digression on that curious point. I have only to state, after an investigation of the subject, and the traditions related to me, as well as much enquiry among the people themselves, that I doubt the Oxus having ever had any other than its present course. There are physical obstacles to its entering the Caspian, south of Balkhan, and north of that point; its more natural receptacle is the lake of Aral. I conclude that the dry river beds between Astrabad and Khiva are the remains of some of the canals of the kingdom of Kharasm, and I am supported in this belief by the ruins near them, which have been deserted as the prosperity of that empire declined. We shall thus account for such appearances on obvious grounds, without calling in the aid of earthquakes and other commotions of nature."

Mr. Burnes thinks well of the Asiatics, and he gives good reasons for his favourable opinion:—

"A caravan is a complete republic; but I do not believe that most republics are so orderly. Of our eighty camels, every three or four belonged to different individuals; and there were four Cafila-bashees. Still there was no disputing about the arrangement or order of the march; and it is a point of honour, that the one shall at all times wait for the other. If a single camel throws its load, the whole line halts till it is replaced; and one feels pleased at such universal sympathy. These feelings make it agreeable to travel in a caravan, for the detentions are much fewer than would really be imagined. The more I mingled with Asiatics in their own sphere, and judged them by their own standard, I imbibed more favourable impressions regarding them. One does not see in civilised Europe that generous feeling, which induces the natives of Asia, great and small, to share with each other every mouthful that they possess. Among Mahommedans we have no distinction of gentleman and villain—at least, so far as hospitality is concerned. The khan fares as simply as the peasant, and never offers to raise a morsel to his lips till he has shared it with those near him. I myself frequently have been partaker of this bounty from rich and poor, for nothing is enjoyed without society. How different is the feeling that besets the sots of lower society in Britain!"

We approve of every sentiment but the last, which is a remark of manifest injustice. "The khan fares as simply as the peasant: nor raises a morsel to his lips till he has shared it with those near him." Good. Mr. Burnes proceeds: "I myself frequently have been partaker of this bounty from rich and poor, for nothing is enjoyed without society." Gratifying evidence still; but then comes the strange and partial reflection, "How different is the feeling that besets the sots of lower society in Britain?" Why, Mr. Burnes would not have struck wide of the truth had he observed, "How different is the feeling that besets the exclusives of high society in Great Britain!" Do our khans share their meals with those around them? Do lords, in England, invite their fellow men to eat with them merely because another wants that which they abound in? If Mr. Burnes thinks so, let him call on the Khan of Buckingham or the Khan of Northumberland at the dinner-hour. Is it only the sots of the lower society that refuse to let all others partake of their hospitalities? If Mr. Burnes went into a cottage in the country, and said he was a traveller hungry and thirsty, the probability is, that he would be offered some such refreshment as the inhabitants could afford; but if he knocked at the door of a mansion of the great

and made the same request, he would be thrust from the threshold with derision and contempt. In this country,

> "The poor man alone
> When he hears the poor groan,
> Of his morsel a morsel will give."

In our state of society, it were absurd to expect from rich or poor the hospitalities of a thinly inhabited and imperfectly civilised people. We do not revile our khans for not sharing their meals with all near them, as Mr. Burnes reviles our lower classes for not sharing their morsels with all who want them; but we do reproach our magnates, and their imitators, with an unsocial, churlish spirit—with a pride in shutting out their humbler fellow men from a share of enjoyment, which would detract nothing, in quality or abundance, from the thing enjoyed. Why do they delight in excluding the people from a view of their parks and places? Why will they not allow them to share in the pleasures of a fine scene, as the generous khan will allow those about him to share even in the morsel going to his lips? The feeling which Mr. Burnes admires in the lords of the East is the feeling the very opposite to that exclusive spirit which possesses and disgraces the aristocracy of Britain.

From the Court Journal.

MEMOIRS OF THE DUCHESS OF ABRANTES.

The 15th and 16th volumes of this diffuse work have at length appeared, and prove to be decidedly the least interesting of the collection. From the moment of Napoleon's decline, the details of this event cease to be interesting. We feel that "the gods have departed," and have not sufficient faith in the philosophy of Madame Junot to enter into the monodies she indites upon their departure. The present volumes contain very little that is new, and relate old anecdotes without piquancy or grace; abounding in stupid repetitions, Madame d'Abrantes' harmless gabble about new palaces, ancestors, liveries, and waiting women has lost the charm of novelty, and she has unfortunately nothing better to supply its place. The tone of the last volume, moreover, is naturally unnatural, from the necessity of narrating the melancholy end of poor Junot, an awkward dilemma from which the duchess has very adroitly extricated herself. One satisfactory announcement put forth in the books before us, is the assurance that the two following volumes will complete the work; but not, however, the "works" of Madame la Duchesse, who, with the aid of her active *coterie*, is about concocting an account of her sojourn in Italy during the years 1817, 18, and 19.

Meanwhile we extract a few trivial ancedotes from the present portion of her memoirs.

Knave and King.—During the reign of Stanislas Poniatowski, says Madame d'Abrantes (and what has it to do with that of Napoleon?) the celebrated Baron Thugut was despatched on a mission to the court of Warsaw, where Baron Stackelberg at that moment represented the omnipotent czarina. Some days after Thugut's arrival, he was invited to a private interview with the king, at his villa near Warsaw; where, having been respectfully received by the aide-de-camp in waiting, he was introduced into a suite of apartments, in one of which he was informed the king awaited him. After traversing several rooms, the baron was about to proceed into the gardens in search of his royal host, when a short dry cough arrested his steps; and looking up, he perceived an individual covered with orders; to whom, according to established etiquette, he immediately offered the three reverential obeisances due to a crowned head. The dignified reserve with which his advances were received, accorded so little with the reputation of his majesty of Poland (who, like all *parvenu* kings, was a sad gossip), that Thugut stood on his guard till he could investigate the matter; and it turned out that the hero of many orders, was no other than Stackelberg, the Russian plenipo! Indignant at having been betrayed into accosting him with so much deference, Thugut took the earliest opportunity to revenge himself. In the course of the evening, having the honour to be the partner of his majesty at whist, the baron played the knave of diamonds for the king of hearts,—an error instantly rectified by the suggestion of Stanislas. Soon afterwards, Thugut again affected to play the knave of clubs for the king of spades:—and again his majesty remonstrated. "A thousand pardons, sire!"—cried he, "this is the *third* time to day I have been stupid enough to mistake a Jack for a king!"

A Difficult Retreat.—Monsieur de Malsaignes was a determined duellist. Having quarreled with a brother officer, they agreed to fight out the dispute in the very room where it had taken place;—when M. de Malsaignes's adversary managed to run him through the body and nail him against the door. "It is all very well, sir," said the transfixed duellist, with singular sang froid, "but pray how are you to get out?"

Getting rid of a Troublesome Guest.—During the conferences of the emperors at Erfurt, Alexander, on entering Napoleon's tent one morning, found him grave and meditative,—after perusing a letter from Valençay, where Ferdinand VII. was then confined. The despatch contained vexatious accounts of the indecencies committed by the young prince. "Why do you suffer yourself to be annoyed by him?" said Alexander, after reading the letter in his turn, "you have your enemy in your power. *Get rid of him at once.* We shall all be the better for it, beginning with the prince himself."

Orator Puff.—One night, after a court had been held at the Tuileries, a man was found concealed behind one of the window curtains, who was at first supposed to be a conspirator. It was observed, however, that his attempts were confined to puffing out every light within his reach, even that held by the Grand Marshal Duroc himself. The man proved to be mad; and having been in the habit of accompanying his deceased father to extinguish the fires of the palace, had taken it into his head that he should find his father's soul situated in a flame of some sort or other at the Tuileries. He was removed to the lunatic asylum at Charenton.

His Imperial Majesty the Ganache.—Napoleon, during the height of his animosity against the Emperor of Austria, was one day so irritated as to call him, in the presence of Maria Louisa, *un ganache.* The word was new to the ears polite of the young empress; but not finding any bliss in her ignorance, she addressed herself to her lady in waiting—"My dear duchess, pray explain to me the meaning of the word *ganache.* Napoleon declares that my father, the emperor, is a *ganache!*" The Duchesse de Montebello, in great consternation, but with the goodwill of a peace-maker, replied that *ganache* implied "a man of distinguished honour and probity." The les-

son was not lost upon Maria Louisa. Some time afterwards, when presiding as regent at the council, and anxious to address a little compliment to Cambacères, she observed, "I am aware Monsieur l'Archichamelin that the emperor possesses in you a *ganache* devoted to his services." It may readily be conceived, the privy councillors were all amazement to hear his excellency addressed as a jackass by their august sovereign.

Imperial Measure.—The following verses were addressed by Napoleon to Madame St. Huberti, on her admirable performance of the part of Dido. Presented by the Duke of Bassano to Madame d'Abrantes, they are curious as affording a solitary specimen of the poetical powers of Napoleon. They were composed when he attained his eighteenth year.

"Romains, qui vous vantez d'une illustre origine,
Voyez d'où dependit votre empire naissant;
Didon n'eut pas d'attrait assez puissant
Pour arrêtu, la fuite où son amant s'obstiné.
Mais si l'autre Didon, ornament de ces lieux,
Eut été Reine de Carthage,
Il eut, pour la servir, abandonné ses dieux,
Et votre beau pays serait encore sauvage!"

"The authority of these lines," adds the duchess, "may be strictly depended upon."

Breach of Public Confidence.—At the period when private letters were opened without ceremony for the edification of the Emperor Napoleon and his functionaries, a packet was examined at the post-office of Trieste, which proved to be written in Hebrew; a tongue which did not happen to be included among the ancient and modern languages cultivated by the clerks. A Jew was accordingly sent for to decypher the suspected despatch; who, on casting his eyes upon the letter, loudly protested his incapability of becoming interpreter. So great was the poor little old man's embarrassment, that the suspicions of the public functionaries became more than ever excited. The more the Jew excused himself, the more the secretaries insisted. The Jew actually shook with terror; and the officials, profiting by his manifest apprehensions, threatened him with all the terrors of their authority, in case of his persisting in his refusal. The poor wretch saw at length that the case was desperate, seized the letter, coughed, demurred, blew his nose, and began—"Blackguards that you are!" (The commandant fixed a fiery eye upon the Israelite, who proceeded to explain that the word blackguards was fairly written down in pure and legitimate Hebrew!) "Blackguards that you are! Do you suppose that if I were fool enough to conspire against you and your paltry town, I should hazard my plots in a letter? No: whilst the present apt apostrophe is being poured into your ears, know that I am laughing in my sleeve at your having exposed yourselves to the ridicule of seeking a translator for my rubbish! May the lesson prove useful, and deter you in future from prying into the secrets of families, and violating the bond of public confidence." The author of this successful hoax was never discovered.

LESLIE.

Leslie, the royal academician, since his return from America, has been engaged in making drawings or painting pictures, to illustrate the poetry of Crabbe; Wilkie and Allan are likewise preparing designs to embellish the same work, all of which we understand will be engraved by the Findens. Leslie, and some other distinguished artists, are at present on a visit to the venerable Earl of Egremont, at Petworth.

Critical Notices.

Literary Life and Miscellanies of John Galt. Blackwood, Edinburgh.

When Mr. Galt had presented us with his Autobiography, we certainly thought that he had wound up his literary career: and it must be admitted, that few have laboured more industriously in the vineyard, or culled choicer fruits. We considered that the autobiography of an author would, of course, contain his *literary life*, for are they not one and the same thing? but we find that we have been under a mistake, for his literary life now makes its appearance. Still we cannot but feel that, either in one case or the other, we have been defrauded. If the autobiography does not contain Mr. Galt's literary life, we have not received our full measure in that quarter: if it does, the present work is supererogatory. However that may be, here it is, dedicated by permission to his majesty, and we trust that our beneficent sovereign will be rewarded for his condescension, by some very refreshing naps over the production.

We have many reasons for not being severe upon Mr. Galt. He has our every good wish; but still we must do our duty to the public; and if Mr. Galt will, after having written so well, try the temper of the public by such a "tail-piece" as the one before us, he must not be permitted to go quite scot free, even when our warmest sympathy is excited towards him from other considerations. When we traveled through these three volumes, we were reminded of an old housekeeper, who, generally after having made her pie, has a piece of dough to spare, which she makes into a little dwarf puff, and sends to be baked alongside of its gigantic brother. The previous works of John Galt are the pies, and very excellent pies have they proved to be. The literary life is the little bit of dough which was to spare, and Mr. Galt has kneaded it, rolled it, buttered it, and baked it, as a tit-bit for his majesty.

"And isn't it a pretty dish to put before the king?"

London Metropolitan.

Court of Sigismond Augustus. Longman and Co., Paternoster Row, London.

This novel is a translation from Alexander Brownikowski, by one of those Polish gentlemen, who have been forced to expatriate themselves to avoid the hug of the Russian bear. It is purely historical, and founded upon the fact of Sigismond Augustus having married a beautiful widow of one of the Polish noblemen, previous to his ascent to the throne. The turbulent and overbearing nobility, aided by Bona, the mother of Sigismond, demand that she shall be repudiated, and that Sigismond shall take another queen, whose high descent shall better warrant their fealty. Sigismond refuses, and the work winds up with his wife being poisoned by the intrigues of Bona at a festival. We consider this as a good work, if it was only from the acquaintance it enables us to form with the manners and customs of the ancient Poles; it also adheres as much as it possibly can do, to the facts of history. The translation is very fair, and we wish it success.—*Ib.*

The Writings of George Washington, being his Correspondence, Address, Messages, and other Papers, Official and Private, selected and published from the original manuscripts, with a Life of the Author, Notes and Illustrations. By Jared Sparks. Rich. Red Lion Square.

We should justly be deemed dead to every generous, every ennobling feeling, had we failed to have rejoiced over the appearance of this solitary volume, the harbin-

ger of others that are to come, that will give us an ample and a correct insight into the character of the great man to whom one half of the world is so much indebted, and whose memory the other half so cordially hates. We have hitherto refrained from speaking of this public-spirited undertaking, from the slight feeling of the gaucherie of noticing a second volume of a projected work before the first has made its appearance; but, as we have now waited months, and it has not yet reached our library table, we shall hesitate no longer, but give our opinion of what we have got, and trust to time for the remainder. Of the volumes that are promised to the public, we should think that this must be, of mere necessity, the most dull, as it consists principally of official despatches, and pieces of history viewed in the detail, and therefore unsatisfactorily, when compared to a general survey of the whole subject. The private letters are interesting and precious, and show the firmness, the strength of character, and the single-heartedness of the great champion of liberty. Washington is perhaps the only honest conqueror and founder of an empire that ever existed. His love of glory was merged in his love of his country, and his philanthropy greater far than his ambition, and even his talents. The whole of the appendix attached to this volume affords excellent matter for the future historian. His diary is most amusing, and equally instructive. We here see Cincinnatus and his plough exquisitely modernised. Ex. gra.

"February 29th. A very great circle round the moon.

"March 6th. Fitted a two-eyed plough, instead of duck-billed plough, and with much difficulty made my chariot wheel-horses plough.

"7th. Put the pole and horses in the plough this morning, and put in the postilion and hind horses in the afternoon, &c. &c.

"26th. Spent the greatest part of the day in making a new plough of my own invention."

More than Wellington can boast.—*Ib.*

—

Biographical Sketches of Eminent Artists, comprising Painters, Sculptors, Engravers, and Architects, from the Earliest Ages to the Present Time, interspersed with Original Anecdotes. To which is added, An Introduction, containing a Brief Account of the various Schools of Art. By John Gould. Effingham Wilson, Royal Exchange.

This is really a valuable book. The introduction is well written, and gives to the uninitiated a complete insight into the different manners of getting up a picture, which are called schools. The explanation of the terms of art, by the use of which connoisseurs so much confound the unlearned in pictures, is well given. The names of the various artists are arranged in alphabetical order, and the notices attached to them are either long or short, as they were more or less celebrated. We do not suppose that any artist would be willingly without this book, and we are sure that it ought to find a place in every library that has any pretensions to utility or extent. *Ibid.*

—

Life of the Prince Talleyrand. Accompanied with a Portrait. Anon. 2 vols. Edward Churton, Holles Street, (late Bull and Churton.)*

This is a detestable work. We fervently hope, for the honour of human nature, that the writer, or the originator, for we have some doubt if they be one and the same, has been deeply injured by the prince, and is his implacable personal enemy; for that alone would be some miserable palliation for the vileness of the attack. But if it be the offspring of spontaneous malignancy, we can only say, that it is a gloomy specimen of the depreciation of the morals of the nineteenth century. Were all these accusations, that the writer offers for facts, true—shame, modesty, and the respect that every man ought to owe to our common nature, should have withheld him from publishing them; but they carry in themselves a *prima facie* assurance that they are maliciously false, and nothing but the most besotted credulity could listen to them for a moment. The prince was always too wise to be so uselessly and gratuitously wicked. Let not the person, if any such there be, who, caring little for truth, seeks only to administer to the pruriency of a depraved appetite, think that he will find a treat in the villanies recorded in these volumes. He will be disappointed: we never before could have conceived that so much dulness could have been combined with so much malice. To get through this book was a labour of weariness and unchanging disgust. The reading is about as dull and as irksome as perusing the page of a dictionary, printed in a miserably bad type. We trust that the very respectable publisher has embarked no property in this speculation upon the evil propensities of the public.—*Ib.*

—

Italy, with Sketches of Spain and Portugal, By the Author of "Vathek." 2 vols. Richard Bentley, New Burlington Street.*

These volumes give a vivid description of the state of the countries enumerated in the title page, nearly fifty years ago. In this spirited work there is food for all classes, and for every variety of mind. The author appears to have traveled with all the glorious pomp and circumstance of wealth, and to have had the doors of palaces, the most recherchés, thrown open to him, not excepting those of royalty itself, by the most flattering introductions from the most influential persons. In fact, these travels, for the work might be appropriately so termed, were only in the highest walks, and kings, queens, and princesses, become as familiar to the reader as household words. There is much of the most polished and the most cutting satire throughout the whole, yet a highly refined, though somewhat sensual feeling, breaks forth at almost every page. He is a nice observer of mankind, as well as a searching one. Though he sees at once the pravity of most of those with whom he comes in contact, it does not prevent him from observing, also, the more delicate shades of character, that will appear in every one, and a little redeem, or at least throw a glitter over, the more startling vices. The book is a history. Every thing, but the almost immutable face of the countries he visited is changed. Customs, institutions, even dynasties, have passed away. The man of reflection, and the politician, knows what now is—let him compare it with what was half a century ago—and to enable him to do so properly, he cannot have a better manual than this talented publication. In these volumes there are many highly wrought scenes, hit off in a masterly manner; indeed, there is nothing elaborated about the work. The author, at times, seems to disdain his occupation of writing, yet his style cuts cleanly and smoothly at one blow, and the most polished and laborious attempts of the literary file cannot equal the effect. He must have enjoyed his travels, and his life, at that period, with a zest that we fear may have given either an insipidity to the rest of his existence, or an irritation for excitement, that those who plod through the weary vale of every-day life would neither comprehend nor desire.—*Ib.*

* Republished by Carey, Lea, and Blanchard. Philadelphia.

* Republished in Waldie's Library, part 2, 1834, and by Key & Biddle.

Egypt and Mahomed Ali; or, Travels in the Valley of the Nile. By James Augustus St. John. 2 Vols. Longman, Rees, Orme, Brown, Green, and Longman, Paternoster Row.

A more opportune, a more valuable, or a better written book it has not, for long, been our good fortune to read. Its massive appearance, in two volumes, made us, in the first instance, almost flinch from grappling with apparently so heavy a work, containing more than one thousand two hundred pages, but the reading of a few of them convinced us that our journey would be pleasant, as it would necessarily be long; indeed, long as the number of pages might seem to indicate it, when we had finished it, we found it all too short. Egypt, and the affairs in the East, become every day of more vital importance, to us inhabiting the far European West. And it must be soon a matter of political vitality to us, to know whether it be the best policy to strengthen the hands, and uphold the empire of our ancient ally, the Turk, or to encourage and extend the infant kingdom of Egypt, now recovering from the effects of its long, and venerable second childhood, in order, in some manner, to preserve the balance of power in the Mediterranean and on the Euxine shores, and thus erect an available barrier against the encroachments of northern rapacity. Already may Russia say, in the language of Holy Writ, that Persia is my wash-pot, and Turkey my footstool. Would it not be well, then, to make Egypt her stumbling-block? But this is a matter that we cannot discuss in a short literary notice. This work is published in the form of a diary, and it is evident that we get the author's thoughts and feelings warm from the brain, and in the excitement of the moment. The advantages derived from a perusal of this work are manifold; in the first place, the country, with all its grand features of scenery, and the picturesque and motley inhabitants, are made to pass before the eyes, as if they were represented in a moving panorama. But not only is the surface of the country thus pleasantly laid before the reader, but he is taken into the bowels of that ancient earth, and all its mystic wonders are displayed; its palaces for the dead, its instructive tombs, its mummies, and its interminable caverns. The Egyptians must have been a burrowing nation. There are some new views elucidated as to the purport for which the pyramids were erected,—we think them just. They appear to have originated from the same motive, and for the same ends, as did the erection of the Phallic towers in Ireland. That they were neither intended for granaries, nor mausoleums, nor receptacles of hidden treasures, Mr. St. John very satisfactorily proves. Indeed, we unhesitatingly come to the same conclusion as he does, and we heartily thank him for enlightening us on the subject. The consideration of the present state of the people subjected to the domination of Ali, affords us nothing but melancholy speculations—and should he be compelled to prosecute his military career, we feel assured, that in that quarter, all the elements of society must shortly be dissolved. The taking to himself the property of the entire soil of the country, was a bold, and would have been a very beneficial measure, had he remitted every other tax and impost. We cannot extend our remarks, but earnestly recommend this work to the general perusal; we do not know any class that will not be benefited by it, and we know that all classes will be amused.—*Ib.*

—

Two Years at Sea. By Miss Jane Roberts. London. Bentley.*

"We have seldom taken up any work which promises and deserves to be so generally popular as this interesting narrative of a protracted voyage to new settlements and countries rarely visited by Europeans who have the talent to describe the places where they touch. * * Several affecting incidents are related which display feminine heroism in its most pleasing form. Of the quickness of observation, and truth and accuracy of the fair author's report, we ourselves can bear honourable testimony. A spirit of the purest benevolence pervades the whole, and we cannot too strongly express our approbation of the truly feminine fortitude which is so unaffectedly displayed in these interesting pages, or of the kindly disposition which, under the most depressing circumstances, enabled the narrator to derive pleasure and amusement from the strange and varied scenes through which she passed."

* Republished in Waldie's Library, part 2, 1834.

—

Tales of a Physician. 2 vols. By W. H. Harrison. Henry Washbourne, Salisbury Square.

Some of these tales may be truly called literary gems, although we affect not the phrase. Gems, we are sure they will produce, but they will be liquid ones—tears must be the accompaniment, if the reader has yet left to him any young feelings to be acted upon. The tales are not of equal interest; yet, to say so, is but a commonplace remark, and the miracle would be if they were so. But what we mean to infer is, that without any of them being indifferent, there is a great range of merit among them, up to actual excellence. One great recommendation of these volumes is, that they may be safely put into the hands of the most strictly and piously educated, for they are not only intensely interesting, but also beautifully moral. They would make admirable presents, from the mother to the daughter, or in any case where it was the object greatly to oblige and amuse, without running the risk of exciting an idea at which a virgin might blush, or displaying a thought which an angel might hesitate to avow.—*Ib.*

—

Jennings's Landscape Annual. Jennings, Cheapside.

This beautiful work is edited by T. Roscoe, Esq., and contains a spirited and interesting history of the Fall of Granada. Without the embellishments, this well written episode in history would be worth not only perusal, but a niche in every gentleman's library. The engravings are, naturally, views in Spain; and more wild and romantic, and we may say, here and there more sublime, delineations of nature, we never looked upon. Those which more peculiarly strike us are, Granada from the banks of Xenil, the Vermilion Tower, Gaucin, and the Hall of Judgment; but all the engravings are very fine, and we trust that the spirited publisher will have the success which he deserves.*—*Ib.*

—

Statistics of the United States of America, for the Use of Emigrants and Travellers. By Thomas J. Tredway, of the State of Tennessee. Effingham Wilson, London.

This practical book affords a very good hint how to parry the intolerable nuisance of cross-examination, viz.

Traveller. Are you the landlord?

Landlord. I guess I be.

T. Can we obtain lodgings for the night?

L. Why, I guess so.

T. What have you got that 's good to eat?

L. Eh——we 've a little thanksgiving pie, some boiled taters, and samp and milk.

T. When was your thanksgiving pie made?

L. O! I guess, somewhere about two days ago or thereabouts.

T. Well, let 's have it.

* The letter press published in Waldie's Library, No. 1. 1835.

L. Here, Betty; I guess you had ought to get these folks a bait. But stop, I'm going to ax this ere man how he comes with that ere one arm only. I say, mister, if I mought be so bold, how did you lose your arm?

T. Well, I'll tell you right candidly, if you will make me one promise.

L. I guess I will. What is it? Now, Betty, listen.

T. Not to ask me another question to-night.

L. Well, I guess I won't.

T. Then, sir, it was bit off.

L. (*to his wife,*) L—d, I'd give the world to know what bit it off.—*Ib.*

Notabilia.

Engine for the Pacha of Egypt.—A few days ago trial was made, from Blackwall to the Nore and back, of a powerful steam-vessel, called the *Nile*, built for the service of the Pacha of Egypt. This vessel is the largest that has hitherto been constructed in this or probably in any country, being by admeasurement 908 tons, and she is propelled by two of Bolton and Watt's engines, of the nominal power of 110 horses each, brought to work up to a power of full 200 horses together. The trial was successful in every respect. The primary object of this vessel is said to be to tow the ships of the line belonging to the pasha in and out of the harbour of Alexandria, but she is capable of being converted to purposes of war in case of emergency. She will take her departure for Alexandria in the course of a few days from Blackwall.

Monument to the Memory of the late Edmund Kean.—The committee held a meeting on Saturday last, when it was announced that about 400 guineas had been subscribed, and that a further sum of 600 would be necessary to complete the undertaking.

Sardanapalus.—Byron's tragedy of *Sardanapalus* was produced at the Dublin theatre on Saturday last, and met with a favourable reception. Mr. Macready sustained the "Hero," and Calcraft the part of *Salemenes*, extremely well.

House of Commons' Library.—It is feared that the losses at the house of commons' library will turn out to be more extensive than was at first expected. It was thought that all the books on the lower floor, where members used to sit to read and to consult the works, were saved, although it was known that all those on the upper story were destroyed: it is now apprehended that between 4000 and 5000 volumes are lost. It may be remembered that an interchange of parliamentary works recently took place between the chambers of France and those of England. Out of upwards of 1500 of these volumes, very few are preserved. Those sent to the house of lords are safe. The chief girders, &c., for the roofs of the old house of lords and the painted chamber, are now on the walls, and iron girders are being placed in the stone building of the commons.

Coleridge's Will.—The will of the late Mr. Coleridge has just been made public. It directs that Mr. Green, of Lincoln's Inn-fields, the friend and helpmate of his worthiest studies, shall have the option of purchasing his library at such price as he shall himself determine; that the pictures and engravings belonging to him in the house of James and Ann Gillman shall be given to Ann Gillman; that the manuscript volume lettered "Arist," presented to him by the Right. Hon. J. H. Frere, be given to Mr. Gillman; that the Georgica Heptaglotta, presented to him by W. Sotheby, Esq. be given to his daughter, Sarah Coleridge; and that gold mourning-rings be given to Mr. Charles Lamb, Mary Lamb, Basil Montague, Esq., T. Poole, Esq. of Nether Stowey, Mr. Josiah Wade, Mr. L. Wade, and Miss Sarah Hutchinson. In conclusion he deplores his inability to leave a suitable provision for his son, Hartley, which arises from his having paid too little attention to his temporal interests. The will is dated Sept 17, 1829, the codicil July 2, 1833.

Byron and Brougham.—It may not be generally known that the late Lord Chancellor Brougham is the real author of the famous article in the Edinburgh Review, on Byron's juvenile production, "Hours of Idleness," for which Jeffery was so severely taken to task in the satire, "English Bards and Scotch Reviewers." We have this fact from an authority on which we can place the utmost reliance.—*Edinburgh Observer.*

Meeting of Geologists.—At the same time that a scientific congress is assembling at Poictiers, there is a meeting of geologists at Strasburgh, the object of which is to examine the riches of the Cabinet of Natural History, and to visit the environs. The number of naturalists of which this meeting is composed, amounts to more than fifty; among them are the most distinguished geologists of Paris, and many *savans* from England, Holland, Switzerland, Germany, &c.

Influence of the Moon on the Atmosphere.—An astronomer at Viviers has for some time been occupied in investigations on this subject. He states, among other results, that under lunar influence the barometer rises from the period when the moon is at 135 degrees from the meridian, towards the east, to the period when, having passed the meridian, it has retrograded as far as 90 degrees, towards the west;—that according to these observations, the moon weakens the barometrical pressure, so that the atmosphere would be much heavier, if the moon did not exist. The following are some further observations in relation to this subject. During the last 20 years, the number of wet days at the new moon, was 78; at its first quarter, 88; at full moon, 82; at the last quarter, 65; at the nearest distance to the moon, 96; and at the greatest distance from it, 84.

Sir Walter Scott.—It is pleasant to see the respect shown to genius, and the worldly advantage, too, that results from showing it. The *Annotateur of Boulogne* remarks, that although princes, ambassadors, and other personages of rank, have at different periods resided for months together at the Hotel des Bains, at Boulogne, Scott occupied apartments for one night only, and the maitre d'hotel wishes all the world should know it. The room ever since has been known by the name of "chambre de Walter Scott." It is tenanted at present by Mayerbeer the composer.

Deaths of Eminent Men.—The recent month has been distinguished by the death of several eminent men, among whom we number Baron Von Schuckmann, Dr. Heim, M. Rode, Count Schwerin, Von Grilack, &c. Unfortunately, Baron William Von Humboldt, Minister of State, is dangerously ill.

Egypt.—The operations for barring a portion of the Nile have been commenced, and a levy of men has been made for the purpose of draining the canal of Mahmoudieg. No less than 20,000 men will be required for this operation, and 50,000 for the works at the point of the Delta. The Viceroy of Egypt has been for some time directing attention to agriculture. It is expected that he will be able to produce two million quintals of cotton in five or six years. The greatest difficulty is the want of hands.

Copyright.—A detection has lately been made of the introduction to this country of pirated editions, printed in Paris, and in other parts of the continent, of new English works which have attained great celebrity, and for the copyrights of which large sums have been paid. Frauds of this kind, if not repressed, will seriously injure the property of English publishers, and take from

English authors their fair chance of profiting by their labours. It appears by the 6th Geo. IV. chap. 107, that the importation of any book of which the copyright has been purchased here, and the work published in this country, is illegal; and therefore Mr. Bentley, of New Burlington-street, whose property has been invaded by foreign piracy, has obtained an injunction from his honour, the master of the rolls, against one of the dealers in the spurious editions in question.—*The Sun.*

The Deluge has been brought out at the Cirque Olympique, at Paris, with scenic representations of appalling fidelity. Even the howling of the winds have there a voice, and the rushing waters chill, if they do not drown, the poor wretches who are made to represent the doomed sons of Adam. *The Deluge* was one of the earliest subjects of the English drama, and was represented three hundred years ago (in 1530.)

Mutations of Fortune.—The newspapers have lately been employed in showing, as proofs of the mutations of fortune, how Abraham Cann, the champion wrestler of England, is now delivering tickets at the halfpenny gate at Stonehouse Bridge; while some years ago, King Louis Philip published a syllabus of a course of lectures which he proposed giving to a limited number of subscribers at the above-mentioned Stonehouse Bridge. To these instances may be added, that Martin, the ex-pugilist, having married a rich wife, is now living at Brighton in great prosperity.—*Brighton Gazette.*

Water-spout in the Irish sea.—H. M. Packet *Thetis*, which left Dublin on Monday evening se'ennight, encountered a heavy gale from the N. E., with continued squalls of rain and wind during the night. At two o'clock on Tuesday morning it became more moderate, with occasional showers, the sky full of very dark, dense clouds. At half-past four, a water-spout (an extraordinary phenomenon in these latitudes) was visible, about a mile from the ship; the trumpet was distinctly formed, but appeared to rest as if the clouds had been feebly charged; at the same time rain was falling from about its region. A portion of it passed over the ship, right against the wind. The cloud appeared in sight about half an hour, and was succeeded by thick, foggy weather, with light breeze, S. E.—*Dublin Register.*

Subscriptions in aid of the fund for erecting a monument to the memory of Scott have been received from Calcutta, amounting to 493*l.* 0*s.* 8*d.*, and 134*l.* 18*s.* 2*d.*, has been sent from Bombay for the same purpose.—*Edinburgh Courant.*

A Liberal Ukase.—The Emperor of Russia has published an ukase, stating that on the occasion of the inauguration of the monument to the memory of his brother Alexander, an annual allowance of two million five hundred thousand rubles is in future to be divided among the functionaries dependent on the ministers of justice and of the interior, under the title of supplementary salaries; which sum is to be augmented as soon as the resources of the empire will permit. A similar allowance has also been made for the army.

Recent Discoveries in Asia Minor.—The Rev. Mr. Arundell, who has just returned from Anatolia, after having made several important discoveries illustrative of the New Testament, has prepared a narrative of his interesting travels, which will soon be laid before the public. The enterprising and learned author has brought to light many important facts connected with the journey and ministry of St. Paul, particularly as regards his sojourn at Antioch with Barnabas, during their joint mission. The site of that famous city has hitherto been considered as doubtful; but the researches of Mr. Arundell have decided the point.

Acoustic Chair.—This invention is of the size of a large library chair, with a high back, to which are affixed two barrels for sound, and at the extremity of each is a perforated plate that collects sound into a paraboloid vase from every part of the room, and impresses it more sensibly on the ear by giving it only a small quantity of air. The converse end of the vase serves to reflect the voice, and to render it more distinct. By means of sufficient tubes this chair might be made to convey intelligence from St. James's to the houses of lords and commons, and even from London to the king at Windsor. Marvellous as this may seem, the idea is not a novelty; it is but another confirmation of the saying of Solomon, that there is nothing new under the sun. M. Itard, in his excellent work on the ear, tells us that Aristotle (who was physician to Alexander the Great) invented a trumpet for his master which was capable of conveying orders to his generals at the distance of 100 stadia, equal to rather more than twelve miles. And I may remark, bearing in mind too that both Alcemon and Hippocrates are said to have invented ear-trumpets, that the ancients do not seem to have been so ignorant of acoustics as some in our day have represented them.—*Curtis on Hearing.*

Sir Walter Scott in Jeopardy.—We had several very pleasant days' sporting among the woods of Yarrow, and along the flats on the banks of the Tweed; on one of which occasions an accident had like to have happened, which would have rendered my visit a painful reminiscence for the remainder of my life, instead of a pleasant recollection of happy moments. Sir Walter, G——, myself, and three or four more of the guests, had proceeded to the lower wood, armed with the implements of destruction to the winged tribes; for although I am no sportsman, and more used to managing briefs than barrels, (I mean gun-barrels,) and memorandums than Mantons, I always wore my belt, and cocked my piece, with as desperate a determination as the best sportsman among them. We had been about two hours in the wood, when G——, attracted by something to the left of the path we were pursuing, called us to follow him, and darted through a thick clump of underwood. Our host was next to him; and, unfortunately, G——'s gun got entangled among the brushwood; when, as he was rather carelessly carrying it with the butt foremost, it went off, as we imagined, full in Sir Walter's face. All was consternation on the instant, and we crowded to the spot: the alarm, happily, was the only mischief, as our host was unharmed. The shot, however, had perforated his hat; and, as he lifted it from the ground, and pointed to the orifice, he said with a smile, "Mr. G——, you have nearly done what all the reviewers and critics in the literary world could not effect —put an end to the Waverley novels." The good humoured manner in which he said this, however, did not restore the harmony of the party. What might have been the consequences of this accident quite depressed our spirits, and we soon returned to Abbotsford. Mr. Hogg had left us the day before this: and I do not think any of the guests but those with us were made acquainted with the awkward circumstance. Sir Walter plainly perceived how much G—— blamed himself for his carelessness, and avoided touching on the subject.—*New Monthly Magazine.*

Coleridge's Study.—A lithograph of the Interior of Coleridge's Study, in the house of his friend Mr. Gillman, at Highgate, which is just published, represents the room with every article in it, precisely as its gifted tenant left it for the last time. It is just such a study as a scholar of simple habits and a love of quiet and comfort would covet. It is a good square attic (the attic has been time out of mind the poet's lodging); and that it is an attic, is evident by the slanting beam denoting the slope of the roof before it was raised, and served the two-fold purpose of study and bed-chamber. One side of the room is almost entirely occupied with a goodly range of bookshelves, well stocked with books, including many old

folios, and we dare say not a few of the "Curiosities of Literature" amongst them. On the opposite side of the room, is a French bed on one side of the fire, and a chest of drawers on the other, with a basin and ewer in one corner. On the table, which is opposite the fire, are some books, one of which is open, and flowers in a bottle; there is a plant in a pot on the drawers also—bespeaking the poet's love of flowers. A chair—not a cushioned elbow-chair, as we should have supposed from Coleridge's love of ease, but a parlour chair without arms—is near the table, as if he had just risen from it; and a towel hangs on the airing-horse at the fire. The open window shows a rural prospect; and a sunbeam entering transiently lights up the deserted room. Two or three portraits adorn the walls: and there are two copies of Gilray's well known caricature of the Whist Party, one of them framed, the other stuck on the wall.

John Galt's Hobby-Horse.—Mr. Galt, being incapable of locomotion, has lately invented a machine which gives him exercise somewhat similar to riding. It is of the form of a cross, the transverse beam moving on a pivot like a balance. From each arm hangs a stirrup-iron, and on the top of the upright are two pullies, through which two cords are reeved, fastened to the extremities of the transverse beam. The unfastened ends hang down in front, with bell-pull handles. When using it, the invalid is seated on an elbow-chair, his feet placed in the stirrups, while he grasps the handles, and gives it motion by drawing the cords, raising and depressing the ends of the transverse beam. The inventor calls it a shelty, *alias* a Highland pony, and says, since the dandy horse is stabled in "the tomb of all the Capulets," it should become as immortal as Pegasus!—*Greenock Paper.*

Mr. Telford's Will.—The will and codicils of the late Mr. Telford have just been proved in the Prerogative Court, and the personal estate sworn to be under the value of 35,000*l.* The testator bequeaths about 3000*l.* to divers charitable institutions, and there are legacies to several persons of mechanical genius, altogether amounting to 16,000*l.* Among the rest, there are 500 guineas to Robert Southey, Esq., the poet laureat. Mr. Telford directs, that in the event of his property not realising 16,000*l.* the legatees should abate in proportion; but should it prove more than sufficient, they are to be intitled to the full benefit, in proportion to the amount of property left. The consequence is, that the amount of each legacy will be doubled, and the poet laureat, instead of receiving 500, will become intitled to 1000 guineas.

Frenchmen's Age.—Age to a Frenchman is like age to wine. It mellows him, and turns his intolerable self-love into some respect for others; trial is perhaps still better. A Frenchman never travels when he can help it Thus he is as much overgrown with prejudices, as a ship in harbour with binnacles. France is all the globe to him; and if he happen, unluckily for himself, to be a Parisian, Paris is all France. This puts him out of the file of companionship on all topics of rational conversation. He cannot, or will not, comprehend the constitution, habits, literature, or history, of any country that lies beyond the borders of France. Thus, I have never found any Frenchman (except the few emigrants) who could understand a syllable concerning England. The names of our institutions ran glibly enough on their tongues; but to give the Gaul a just conception on the subject of any of them, was labour in vain. The indescribable air of self-satisfaction with which the untraveled Frenchman discusses the most intricate matters of foreign life, forms the last finish to his disqualifications as a member of general society; and the utter impossibility of convincing him that he has *any thing* to learn, should make every man in his company limit his topics to the coffee-house or the theatre. But our old Frenchman had been taught better things in the hard school which compels all its pupils to learn something.—*Blackwood's Edinburgh Magazine.*—[The Bourbons are an exception; they hold out bravely against the lessons of the school of adversity.]

Population of France.—The average annual births in France for the last ten years have been 967,490, and that of the deaths 781,480; so that the average annual increase of population has been 186,000. The aggregate increase during that period has been 1,700,000; of which number 1;045,000 were males, and 815,000 females; making a majority of males of one in five. The annual average of marriages has been 334,544.

Miss Mitford.—Amongst the distinguished members of the old baronial family of Mitford, so renowned as border chieftains, when war was pastime, and as men of letters in gentler times, we must not omit the fascinating author of "Our Village," Mary Russell Mitford, a scion of the feudal lords of Mitford Castle. Francis Mitford, of Hexham, married Jane Graham, of Old Wall, in Cumberland, of the Grahams of Netherby, and was father of the Rev. George Mitford, born at Hexham, 15th November. 1760, who espoused Mary, only daughter of the Rev. Richard Russell, D. D. a remote but lineal descendant of the noble house of Bedford, and has one surviving child, Mary Russell Mitford. Besides the fame acquired by the most animated delineations of rural life in the English language, Miss Mitford enjoys high reputation as a dramatic writer.—*Burke's Commoners.*

Mutation.—It is a fact worthy of notice, that the estate of Theobalds, which was granted by Charles the Second to General Monk for his services at the restoration, has descended by intermarriages to the representatives of the Cromwells, Mrs. Cromwell Russel, of Cheshunt Park, the great great great grand-daughter of Oliver.

We had imagined that the ghost of the "Man in the Iron Mask" was laid—that this sphynx had been sufficiently unriddled by M. Delort and the late Lord Dover. But there are to be "more last words," it seems, on the subject. The *Mémoire Bordelais* of September 22, announces that an important work is forthcoming, which is to prove the famous prisoner to have been, not Count Matthioli, but Don John of Gonzaga, natural brother of Charles Ferdinand, duke of Mantua. Disguised and covered with a mask of black velvet, he, it is said, accompanied Matthioli, and acted as his secretary. He was carried off along with him, but allowed to return lest the flagrant violation of the rights of nations should become known.

We have characteristic news this week from Russia. The *Constitutionnel* of Thursday contains several ukases of the Emperor Nicholas, imposing new severities on, and abolishing several liberties heretofore enjoyed by, the Poles. The *Code Napoleon*, which had been acted upon, is, for the future, to be disused.

The learned antiquary, the Abbé Facciolati, on opening an Etruscan vase, recently excavated from the ruins of Pompeii, found an orange immersed in vinegar. It appears that the ancient Romans pickled their oranges, as we do cucumbers or onions. The orange above mentioned was in a state of perfect preservation.

The Fine Arts in France.—Various works of art are now in course of execution at the *Ecole des Beaux Arts*, among which is a cast of the Moses of Michael Angelo, which has been brought recently from Rome. The object of the minister of the interior in procuring it was, that it might serve as a model for the various schools of sculpture in different parts of France, and copies on a reduced scale have been cast in bronze in order to be sent to the provincial schools and museums.

The Rev. Mr. Gutzlaff, it appears by the Missionary Chronicle, is about to take another voyage into China up the Yang-tse-keang, through central China to Thibet.

The Doctor's Wit.—Phillips, as *Hela*, in the *Mountain Sylph*, had much ado to keep his long elf-locks out of his mouth while singing, "What is the matter with Phillips?" said a lady. "I think it is a *lock*-ed jaw," replied a pseudo medical wit.

Substitute for Coffee and Snuff.—A curious discovery is spoken of by *Le Voleur*, no other than a plant, which it is only necessary to look at when there is a desire to sneeze! and which when reduced to powder, makes a delicious beverage, somewhat similar to coffee.

Literary Intelligence.

The first half of Westall and Martin's Illustrations of the Bible is completed, by the publication of the Sixth Part: one engraving in which—Delilah and Sampson, by C. Nesbit,—surpasses any thing we have seen on wood, in distinctness and relief, in firmness of line and delicate finish.

A third edition of Professor Lyell's *Principles of Geology*—the most complete and masterly exposition of this (we might add, almost of any) science, at once simple and lucid in its style and arrangement, and liberal and philosophic in its spirit—comprises in four smaller volumes the entire matter of the three thick octavos; with the benefit of the author's revision, and those corrections and additions which his subsequent experience has suggested. A list of these alterations is introduced in the preface, with reference to the other editions: this is the more necessary in a young science like geology, the discoveries in which are daily confirming facts, resolving doubts, or suggesting fresh speculations. A summary of the scope and bearing of the work is also prefixed to the table of contents; and a glossary of terms is appended. Not the least striking and popular feature in this new edition, however, is the low price at which it is published. Here are four compact duodecimo volumes, each of four hundred well filled pages, neatly printed, and interspersed with numerous wood-cuts and copper-plates, some of them coloured, for the price per volume of the Standard Novels. For a scientific work to vie with one of fiction in cheapness, is indeed evidence of the schoolmaster's progress: though geology, just now, is certainly the most popular, because the most novel and interesting of sciences.

Tke month has brought us its usual budget of serial works and periodicals.

Lardner's Cabinet Cyclopædia now includes a Preliminary Discourse on the Study of Natural History, by William Swainson.

To the Library of Entertaining Knowledge is added the first volume of an account of the Hindoos, their history, antiquities, habits, and country, arranged with great clearness, and illustrated with elaborate wood engravings of the scenery and architecture of Hindostan, from drawings by William Westall.

The sixth volume of Sir Walter Scott's Prose Works contains his essays on Chivalry, Romance, and the Drama, which appeared in the Supplement to the Encyclopædia Britannica; and is embellished by a most romantic view of Jerusalem, and a striking view of Shakspeare's monument in Stratford Church, by Turner.

The seventh volume of Allan Cunningham's edition of the Works of Robert Burns concludes the Letters; but does not include the singular correspondence with a lady in Edinburgh, known as "Clarinda," and which were printed, but suppressed by legal injunction. Their omission is a loss to the editions of his works, and yet no protection to the feelings of any party, supposing such protection to have been necessary,—as they are circulated, like all suppressed books, in cheap and incorrect publications.

The ninth volume of Valpy's edition of Hume and Smollett's History of England commences Smollett's portion; and is embellished with portraits of the author, and the sovereigns, the account of whose reigns is included in the volume; and an elaborate line engraving of West's well known picture of the Battle of the Boyne as a frontispiece.

Part XLIII. of Cuvier's Animal Kingdom completes the class "Pisces," of which it is the third part.

The Fifty-fourth Part of the Encyclopædia Britannica is wholly occupied with the article "France;" whose history it commences, and brings down to the French Expedition to Egypt. The plates illustrative of "Fortification" include a plan of the last attack on the citadel of Antwerp by the French.

The Eighth Part of Murray's Encyclopædia of Geography completes "Turkey in Asia," and includes "Arabia," "Persia," and "Hindostan."

The Eleventh Part of Loudon's Encyclopædia of Gardening concludes the third division, treating of the science, and commences the fourth, which is devoted to the practical operations of the gardener.

France.—M. de la Martine's account of his recent tour to the Holy Land, &c., is said to be preparing for publication.

An interesting little volume has recently been published by M. Paulin of Paris, entitled, "Le Romancero Français, ou Histoire de quelques Anciens Trouvères, et Choix de leurs Chansons." These "Ancient Songs of Love and War," originally composed by French Trouvères, which have been buried in oblivion for the last 600 years, are now once more brought to light by the fortunate investigations of this young "employé aux manuscrits" of the Royal Library. The biographical notices and glossarial explanations which he has added, exhibit an intimate acquaintance with the French literature of the middle ages. Another young French antiquarian, M. Francisque Michel, who has already distinguished himself by several publications on similar subjects, is now diligently exploring our national archives for MS. works and documents connected with that literature.

M. Ambrose Firmin Didot has recently published a complete French translation of Thucydides with the Greek text opposite, and an appendix of life, notes, &c. &c. The book is very handsomely printed in 4 vols. 8vo. Great pains have been taken to ensure a correct text and a faithful version. It does much honour to M. Didot. We are returned to the times when celebrated printers were distinguished men of letters.

M. Marcel has just published a History of Egypt, from its conquest by the Arabs to that by the French, in an 8vo volume.

The 4th volume of Professor De Candolle's Prodromus Plantarum is now in the press.

The 5th and 6th volumes of the French translation of Colonel Napier's History of the Peninsular War, edited by General Dumas, are about to appear.

Two livraisons, or 4 vols. of a Supplement to the Biographie Universelle of Michaud have recently made their appearance. They consist of a Dictionnaire Mythologique, complete in 3 vols. and the first volume of the actual Supplement of Lives omitted in the Biographie, or persons who have died since its publication.

A metrical translation into German of the Bhagavad Gita, with grammatical and mythological illustrations, is now in the press, by Rud. Peiper.

Augustus Matthiæ, the author of the well-known Greek Grammar, has announced an Encyclopædia of Philology.

Retzsch is proceeding with his illustrations of Shakspeare. Romeo and Juliet may be expected shortly.

Another production of his, under the title of "Fancies," is about to make its appearance in London.

The second and concluding volume of Scholt's edition of the Greek New Testament, so long and anxiously looked for, is announced as in the press.

A second, and much improved edition, of Professor Vater's Index to the Grammatical and Lexicographical Literature of all Nations, is about to appear.

Mr. Van Hammer's History of the Turkish Empire is now completed in 10 vols. 8vo. The history terminates at the peace of Kainardji, in 1774. The 9th and 10th volumes comprise General Indexes, and a variety of catalogues and tables of matters referred to in the course of the work, with the author's reply to the various criticisms which have appeared upon it.

A Conversations-Lexicon for Ladies has just been commenced, which is proposed to be completed in eight volumes, or thirty-two parts, three of which will be published every two months, and each volume will contain the portrait of some celebrated female. The contents, we are assured, will be especially directed towards the religious and intellectual improvement of the sex, as the brightest ornaments and firmest props of society.

A Hungarian translation of the "Conversations-Lexicon," with additions, is now in progress, and contains original contributions from several distinguished Hungarian noblemen: among whom are Count Mailath, Desewffy and Pelcki, and the Baron Wesselenyi, who formerly resided some time in England, and has contributed an article on English horses.

A sort of literary congress is about to be held at Berlin in order to draw up some general regulations, with a view to secure the copyright of authors and booksellers throughout the whole of Germany. A committee of booksellers have already been formed at Leipsig, and protocols have been exchanged between this committee and the Berlin commission.

The first instance in the annals of Turkish literature, of works announced for publication by subscription, appeared in the Turkish State Gazette of October 22d, 1833, and the works thus signalised are three historical, five grammatical, and four poetical. As the historical works are by far the most interesting, we subjoin the titles of them.

I. Lives of the Sultans and Visirs by Osmansade Ahmed Taib, who died in 1723, with a continuance by three others.

II. Lives of the Muftis by Suleiman Seadedden Ben Mohammed, celebrated under the name of Mussakim Efendisade, and written by him in 1744.

III. Lives of the Reis-Effendis, by the Reis Effendi Ahmed Resmi, and with a continuation to 1807 by Suleiman Faik.

The new novel, by Miss Pardoe, author of Traits and Sketches of Portugal, is to be entitled, "The Mardens and the Daventrys."

"Young Hearts," a Tale, which is to appear under the sanction of Miss Jane Porter, will be ready in the ensuing month.

A Translation of the last work of the celebrated Schlegel on the Philosophy of History, is just completed, and will appear forthwith.

Previous to her leaving England, Mrs. Jameson left in the hands of her publishers the corrected copy for a new and enlarged edition of her interesting work, "The Lives of Celebrated Female Sovereigns."

Miss Strickland has in the press a new novel, entitled "The Pilgrims of Walsingham."

"Chances and Changes," by the popular author of "Six Weeks on the Loire," may be expected in the course of the ensuing month.

The Exile of Erin, or the Sorrows of a Bashful Irishwoman, in 2 vols. post 8vo.

Kean, a Poem. By Theodore Norton. With a Portrait engraved by Samuel Reynolds, from a S. Cousins.

History of Edward the Black Prince. B James, Esq., Author of Mary of Burgund vols. 8vo.

Notes on Italy and Rhenish Germany, wi sional Notices of the Climates of Italy and th Springs of Germany. By Edwin Lee, Esq. S., with plates.

The First Volume of the Transactions of mological Society of London.

We have to announce for publication a m work for the Clergy in general, and for Stude vinity, under the title of "Skeletons of the S the most eminent British Divines," by the Hughes, Prebendary of Peterborough. To on the first of December, in Monthly Parts, 130 pages, price 2s. 6d. each. These Skeleto tended as models of scriptural argumentatio young divine, in the arduous task of comp the pulpit; and the work has been undertal request of several members of the church in co of the great expense of the voluminous origin

The Spirit of Chaucer, in 2 vols. By Cha den Clarke, author of Tales from Chaucer, in

De La Macy; a Novel, in 2 vols. By Jos. Lomas, Esq.

Original Fables. By Job Crithannah, (se tion,) with 85 designs, by R. Cruikshank.

A new edition of the Works of Milton, in parts, with Life and copious original and collat by Sir Egerton Brydges, and historical and tive illustrations, by J. M. W. Turner.

H. D. Inglis has published "A Journey th Ireland in the Spring, Summer, and Autumn during which, we understand, he has carefully ed the country, and made himself acquainted condition of all ranks of its inhabitants. Fro thor of his acuteness and observation we are ir expect a very interesting work on a very i subject.

Colonel Murray's Sketches of Scotish Sce publication of which has been so long delayed, ly completed, in a double number, to form o some volume.

Village Reminiscences, by an Old Maid.

A new Work on America, called the Unite and Canada in 1832, 3, and 4, by C. W. A Esq. has been published.

A new edition of Mr. Henry Bulwer's Fran

In the press.—A new edition of the Selecti Wordsworth.—A fifth edition revised and enl Death, with other Poems, by Robert Montgom ing the second volume of the new edition of h —A Series of Catechetical Lessons, with engr Zeitter, by Rachel Howard of Ackworth.— the Right Rev. Reginald Heber, by Thoma author of the "Life of Cowper."—A Practica tion of the Gospel according to St. John, in t Lectures, &c., by the Bishop of Chester.— duction to the Study of Shakspeare, by Rhece

The appearance of a second edition, within a months of the first, of a dramatic poem occu goodly volumes—the title and subject of whi say the least, not very inviting to the great m readers for amusement—is almost a phenomer literature of the present day; when verse, whet or tagged, is at a discount. It is a remarkab couraging proof that really good poetry will su its way to public favour. We allude to the ne of Mr. Henry Taylor's Philip Van Artevelde. the rising popularity of a poet who combines of his qualifications solidity, sound sense, kno human nature, a vigorous understanding, a liv

and deep reflection; who expresses his thoughts in plain and even homely idiomatic diction; and whose style is at once terse and eloquent, nervous and graceful. The success of such a truly English writer, will have some effect in superinducing a healthy tone in the public taste for poetry; which has been not only satiated but surfeited with the morbid and sickly fancies of verse-spinners.

Archery and Archness is not a suggestive title. This little book is a collection of *jeux d'esprit*, sometimes in verse, sometimes in prose: the subjects are occasionally general, as a "Lesson in Reviewing," but more frequently personal; a few are fanciful, or rather were so intended by the author.

Madame Junot's Lives and Portraits of Celebrated Women, is concluded rather than completed, by the publication of the Fourth Part; containing notices of Lady Wortley Montague, and the Queens Christiana of Sweden, Marie Antoinette, and Mary de Medicis. Biographies of such well-known personages can only be made interesting by new facts or profound reflections; neither of which enrich these Memoirs. The portraits are French versions of the originals; those of the large edition, lithographed in the free, smooth, and masterly style of Maurin, one of the best French portrait draughtsmen.

M. Kops, bookseller, of Brussels, has in the press a highly important work in the French language, under the title of "Du Royaume des Pays Bas, sous le rapport de son origine, de son developement, et de sa cure actuelle, suivi de pieces justificatives. Par le Baron de Keversberg."

Mr. Murray has issued a prospectus of his Variorum Edition of Boswell's Life of Johnson, to be printed uniformly with the Life and Works of Byron and Crabbe.

Mr. Valpy is preparing for early publication, a new edition of Boswell's Life of Johnson, in monthly volumes, interspersed with many anecdotes and documents never before published. Johnson's Journey to the Hebrides, and his Tour into Wales, are to be incorporated in this edition.

Houses of Parliament. A History and Description of these Buildings, and of the ancient Palace, with its Appendages, which formerly adorned the City of Westminster, is announced for publication by Messrs. Brayley & Britton. The work is to be illustrated by numerous engravings, showing the style and character of the successive architecture which belonged to the Anglo-Saxon, Anglo-Norman, Plantagenet, and Tudor dynasties.

Fire at the Parliament House.—Several prints of the Great Fire of the Parliament Houses have already appeared—one, indeed, was published the following morning—in lithographic, aquatint, and wood engraving. Whatever other deficiencies they may have, there is no lack of fire and smoke.

The third volume of Mr. Montgomery Martin's History of the British Colonies, comprising the whole of our possessions in North America, with maps, official documents, and accurate statistical tables, is in an advanced state at press, and will speedily appear.

On the 27th ult. the British consul presented to the governor-general all his fellow-countrymen now at Algiers. Among them was Mr. Thomas Campbell, the distinguished poet. It is said that he will remain several months at Algiers to study the literature of the country.

The reported loss of the death-warrant of King Charles I. proves erroneous, that document being safe in the possession of the librarian of the house of lords, in whose custody it had been placed. Owing to the existing state of the building, it will be deposited by him for security in "King Edward's Tower," with the MS. acts of parliament.

Great improvements have recently been made in the *Jardin des Plantes*, in Paris. A new gallery of mineralogy, which has been some time in progress, is now nearly completed. The erection of a new hot-house has also commenced. It is to be constructed of iron, copper, and glass, and heated by steam, by means of pipes running under the building. This hot-house is intended for the reception of the large equatorial plants.

"Anne Grey," edited by the author of Granby, is understood to be the work of the editor's sister, Miss Lister, a young lady of twenty. The works of Mr. Lister are well known and appreciated; "Dacre," by Mrs. Lister, is one of the favourite novels of the last season; and "Anne Grey" is eminently successful in the delineation of feminine character, feminine thoughts and feelings. It is not the least singular sign of these novel times that three excellent novelists should be found in the same family.

Mr. Taylor, the author of "Philip Van Artevelde," is one of the clerks in the colonial office. In the olden time, a poet would have made but a sorry clerk; but it is said that Mr. Taylor is not only one of the most efficient in talent, but one of the most hardworking men on the establishment of the colonial office.

An extensive printing office has been established at Roanne, in which none but females are employed in composing and reading proofs. An experience of six months has satisfactorily proved the advantage of this new plan, owing to the superior regularity and attention to business manifested by the *female workmen*.

Count de Peyronnet, in his recently published Memoirs d'un Prisonnier, mentions that, by a curious coincidence, the police commissary who has the surveillance of the Fort of Ham is named M. Charles Dix.

Waldie's Select Circulating Library.

As this advertisement may reach some who are not acquainted with the plan and object of the "Library," a statement and explanation are appended.

The "Library" was commenced more than two years ago, and was the first established on the plan of giving periodically entire reprints of books, and sending them by mail. It met early with very decided success, which has been daily increasing. It has been long placed on the firmest basis, and therefore, on subscribing, no risk is incurred from a non-fulfilment of promises.

As the best evidence of the capability of the work, a list of the books published for 1833 and 1834, is subjoined, which will explain better than any assertion at what reduction of price books may be had.

CONTENTS FOR 1833.

Lafayette and Louis Philippe. By B. Sarrans.
The Gentle Recruit, a tale. By the author of the "Subaltern."
Saratoga. By the same.
A Family Tour in South Holland. By Col. Batty.
Lives and Exploits of Banditti and Robbers. By C. Macfarlane.
The Italian Exile in England. By Count Pecchio.
Memoirs of the Duchess of St. Leu—Hortense.
Journal of a Nobleman at the Congress of Vienna.
Letters from the Earl of Chatham to his Nephew.
Editorial Notices, Poetry, Anecdotes, &c. &c.
Wacousta, or the Prophecy, a tale of Detroit and Michilimackinac. By the author of "Ecarte."
Mrs. Lushington's Journey from India to England.
Rambles of a Naturalist. By Dr. Godman.
Life of Dr. John Leyden. By Sir Walter Scott.
Waltham, a novel; being Vol. III. of the Library of Romance.
Memoirs of Dr. Burney. By Madame D'Arblay, author of Evelina, Cecilia, &c.
The Black Velvet Bag, and Mademoiselle Therese. By Miss Mitford.
Elliott's Letters from the North of Europe.
Memoir of Silvio Pellico.
Madame Dard's Narrative of the Shipwreck of the Medusa.

Fallacies of the Young. From the same.
The Start. From the same.
Biography of Eulenstein. From the same.
Spontaneous Combustion of the Human Body. From the same.
Rural Pleasures. From the London New Monthly Magazine.
A Day at Fonthill Abbey. From the same.

Italy; with Sketches of Spain and Portugal. By the author of Vathek.

The Two Scotch Williams. From "Nights of the Round Table," by Mrs. Johnstone.

The Little Ferryman. From the same.

Salvator Rosa, or the Portrait of Danae. A Comedy in two acts. Translated from the German of Professor Deinhardstein.

I Think of Thee. From the German of Goethe.

The Cruise of the Midge. From Blackwood's Magazine. Chapters 1 to 6.
Chapters 7, 8.

Excerpts from Sharp's Letters.

Henri Quatre; or, The Days of the League. An historical novel.

Excerpts.

The Black Death in the Fourteenth Century. From the German of Professor J. F. C. Hecker, M. D. Translated by B. G. Babington, M. D.

The Spanish Lady, a Tale. By the author of "Family Portraits."

Two Years at Sea; being the Narrative of a Voyage to the Swan River and Van Dieman's Land, during 1829, 30, 31. By Jane Roberts.

Randolphiana.

Why don't the Men Propose. From the London New Monthly Magazine.

French Novels of C. Paul de Koch. From the Foreign Quarterly Review.

The Charmed Sea, a Tale, by Harriet Martineau; being No. 13 of her "Illustrations of Political Economy."

Traditions of the American War of Independence. From the United Service Journal.

Besides this amount of books, there is a weekly cover, called *The Journal of Belles Lettres*, containing four pages as large as the Library, filled with critical notices of new books, list of new publications, foreign and domestic, with other generally interesting literary information, furnished gratuitously.

The following is from a late prospectus.

In the "Library" are reprinted the choicest productions of the British press, in the various departments of TRAVELS, VOYAGES, MEMOIRS, BIOGRAPHY, NOVELS, TALES, &c. &c.

The adaptation of the periodical form to the publication of books entire, first adopted, by the subscriber, in the present work, met, on its announcement, with a spontaneous and very general expression of approbation. The peculiar advantages of the plan were at once recognised, and its practicability soon became evident.

The effects of this mode of publication on literary pursuits may not be inaptly compared to those of canals and railroads in commercial operations—in equalising situation; placing the farmer, the country merchant, or the mechanic, however secluded and isolated their respective locations, on a footing with the inhabitants of a city. A resident in the most retired hamlet can now have a book sooner than the publisher's next door neighbour could in former times; and his convenience and taste for reading can thus both be consulted at an expense too inconsiderable to be seriously mentioned, when put in competition with the gratification.

At the former prices of books in this country, on inferior paper, those given each year would cost about 50 dollars.

Were the comparison of prices extended to the cost of London books, it would be found that we have supplied an amount of printing which cost in London $166 for the small sum of *five dollars*.

When the advantages of circulation by mail are considered, and also that, in clubs of five individuals, each gets the work for $4.00, which difference pays the postage, under 100 miles, it must be admitted, on all hands, that it is the greatest reduction on the usual selling prices of any article ever attempted, much less *executed*. But the subscriber does not found his claims to public patronage alone on the cheapness of his periodical. The works published have been of a highly literary and very attractive character, as is proved by second book editions having followed those of the "Library" with rapidity, and every one of which, even at the advanced price charged in that form, has had a most rapid sale.

The time and attention of the editor are al-

most entirely devoted to making selections for the work, and in seeking, from the mass of books in the public institutions of Philadelphia, as well as from the new books imported from Great Britain, the most interesting and valuable matter; and he has had the pleasure of bringing before the American public several works which otherwise would probably not have been reprinted here. His situation as Librarian to the Philadelphia Library, the largest collection of books in the United States, gives him facilities possessed by few.

By printing the "Library" on a single sheet, the postage is reduced to the lowest rate.

There is growing up in the United States a numerous population, with literary tastes, who are scattered over a large space, and who, distant from the localities whence books and literary information emanate, feel themselves at a great loss for that mental food which education has fitted them to enjoy. Books are cheap in our principal cities, but in the interior they cannot be procured as soon as published, nor without considerable expense. To supply this desideratum is the design of the present undertaking, *the chief object of which emphatically is, to make good reading cheaper, and to put it in a form that will bring it to every man's door.*

Books cannot be sent by mail, while the "Select Circulating Library" may be received at the most distant post office in the Union in from fifteen to twenty-five days after it is published, at a little more expense than newspaper postage; or in other words, before a book could be bound in Philadelphia, our subscribers in the most distant states may be perusing it in their parlours.

The proprietor is in regular receipt of new books printed either in London or Edinburgh, together with the periodical literature of Great Britain. From the former we shall select the *Novels, Memoirs, Tales, Travels, Sketches, Biography, &c.* and publish them with as much rapidity and accuracy as an extensive printing-office will admit. From the latter, such literary intelligence will regularly be culled, as will prove interesting and entertaining to the lover of knowledge, literature, and novelty. Good standard novels, and other works, now out of print, may also occasionally be reproduced in our columns.

The publisher confidently assures the heads of families, that they need have no dread of introducing the "Select Circulating Library" into their domestic circle, as the gentleman who has undertaken the Editorial duties, to literary tastes and habits adds a due sense of the responsibility he assumes in catering for an extended and moral community, and of the consequences, detrimental or otherwise, that will follow the dissemination of noxious or wholesome mental aliment. His situation and engagements afford him peculiar advantages and facilities for the selection of books. These, with the additional channels created by agencies at London, Liverpool, and Edinburgh, warrant the proprietor in guaranteeing a faithful execution of the literary department.

It would be supererogatory to dilate further on the general advantages and conveniences which such a publication presents to people of literary pursuits wherever located, but more particularly to those who reside in retired situations they are so obvious that the first glance cannot fail to flash conviction of its eligibility.

TERMS.

"The Select Circulating Library" is printed weekly on a double medium sheet of fine paper of sixteen pages with three columns on each, and mailed with great care so as to carry with perfect safety to the most distant post office.

It is printed and finished with the same care and accuracy as book work. The whole fifty-two numbers form two volumes well worth preservation, of 416 pages each, equal in quantity to 1200 pages, or three volumes, of Rees's Cyclopædia. Each volume is accompanied with a Title-page and Index.

The price is *Five Dollars* for fifty-two numbers of sixteen pages each,—a price at which it cannot be afforded unless extensively patronised. ☞ *Payment at all times in advance.*

Agents who procure five subscribers, shall have a receipt in full by remitting the publisher $20, and a proportionate compensation for a larger number. This arrangement is made to increase the circulation to an extent which will make it an object to pay agents liberally. *Clubs of five individuals may thus procure the work for* $4.00, *by uniting in their remittances.*

Remittances may be made to the publisher, at his expense, if paid in money current in Philadelphia.

ADAM WALDIE,

No. 207, Chesnut street, basement story of Mrs. Sword's Philadelphia House.

Philadelphia, December, 1834.

As an exemplification of the public approbation expressed by different editors throughout the country, we subjoin a few notices out of many hundreds.

Waldie's Circulating Library.—The plan of Adam Waldie, for the dissemination of literature, will produce an important revolution in the reading world. Hitherto, men remote from cities and of limited property, were shut out from a participation of the benefits resulting from books. The discoveries of science—the Journals of travellers and the splendid corruscations of wit and genius, were to them sealed volumes, but Waldie, by the establishment of the Library, has shed a new light upon the human mind—he has unsealed the volumes of genius—he has thrown wide open the vestibule of the temple of learning, and *all* who *will* may enter, and the key which he has placed in their hands will enable them to traverse its intricacies.

It was stated by Godwin, that, "labour was the slaughter house of genius and of mind." In Godwin's days, the observation was true in more than one sense. Then, even if a mechanic or labouring man had a desire

to relax a little in his labour and luxuriate upon the intellectual productions of his fellow man; the price of books was such, that it entirely precluded him from the enjoyment of his wishes—books were forbidden fruit which his poverty prevented him from tasting. The world to him was a "peopled desert," he had to plod on, adding by his skill to the comforts and enjoyments of his more favoured fellow creatures, or cultivated fields for other's use, while his own *mind* was a barren waste, without any spots of intellectual verdure. But now, particularly in the United States, the scene has entirely changed. By the perfection of the press, periodicals have within a few years multiplied with a rapidity unlooked for; and unexampled in the annals of the world. The industrious poor can now have works of sterling worth placed on their tables for a few *cents*, that once cost *guineas*. By the system of periodicals, a few dollars will purchase libraries, for which, thirty years ago, a mechanic's savings for years would have been inadequate. 'Tis to such men as Adam Waldie that we are indebted for this great, this wonderful revolution.—*Western Palladium, New Lisbon, Ohio.*

Mr. Adam Waldie, the talented and indefatigable publisher of the "Circulating Library," has issued proposals for the 5th vol. of that cheap and valuable periodical, to commence early in January, with new and improved type. We shall give it an early insertion, in order that the public may see what Mr. Waldie promises; and the utmost reliance may be placed in what he says, as he is remarkable for the faithfulness with which he redeems his pledges. We have so often expressed our approbation of the "Circulating Library," that we deem it unnecessary to say more than to recommend it to public patronage.

The "Port Folio," or Companion of the Library, will also appear soon, and judging from the specimen No. which has been issued and the reputation of the editor, we can without hesitation recommend that also to public notice, as an entertaining and valuable work.

Examiner, Oxford, N. C.

Waldie's Select Library, which has now been published nearly two years, continues to be one of the most interesting as well as the cheapest periodical of the day. For $5 a subscriber here gets what he would ordinarily have to pay $50 for in the shape of books. The Library is of the quarto form, and printed on fine paper, new type, and in the neatest manner. Every individual that can afford $5 for the current literature of the day, cannot expend it more judiciously than by subscribing for this work.—*Working Man's Advocate, Belfast, Maine.*

The following is a just tribute of praise to a valuable work.—Ed. Md. Journal.

Waldie's Library.—We were particularly struck with the truth of some remarks on the subject of literature in South America, while reading the very interesting book, entitled "Three Years in the Pacific, by an Officer in the United States Navy," just issued in a handsome octavo, by Messrs. Carey, Lea & Blanchard. He says, "The general taste for reading, in any country, may be estimated by the number and kind of various periodicals published in it. A valuable publication, like 'Waldie's Library,' a work which is doing so much in the United States to diffuse a taste for reading, and, consequently, for the diffusion of knowledge, (the demand for which speaks well for the good taste of our countrymen,) would not be patronised in any state of South America; simply for the reason that a taste for literature is not general. A volume of 'Waldie,' always delightful on land, is a desideratum at sea, from its compact and portable form. Passengers in merchant ships, who find complete sets on board, may deem themselves fortunate. The libraries of United States' vessels should never be without them." These are just observations, and, we trust, will be acted on by those interested. Each year of "Waldie" contains twenty or thirty entire books, in addition to a great variety of short, entertaining, and instructive articles, at a price about equal to *twenty-five cents*, for what costs in London *five dollars*. The work, we are rejoiced to find, is still most eminently successful. The novel of "Henri Quatre," now publishing in the Library, is one of the best of the historical romances since Waverly.—*Penn. Inquirer.*

From the Shenandoah Advertiser.

Waldie's Select Circulating Library.—The reader is referred to the prospectus of this valuable publication, in another column in this paper. When we say that, in our opinion, it comes up to all that is promised in the prospectus, we think we have accorded to it sufficent praise. It is in fact a "Circulating Library," each number containing as much matter as one volume of Scott's novels; to be published weekly, 52 numbers completing a volume, at five dollars per volume, payable in advance.

From the Washington Republican.

Among the many literary enterprises of the present day, none offer greater facilities, or a cheaper method of conveying expeditiously from one extremity of the country to the other, that truly popular species of literature—novels, journals, &c. &c., than the "Select Circulating Library," the prospectus of which we publish this week, and to which we respectfully refer our readers. It is a new experiment; and we trust its enterprising undertaker will meet with proper encouragement. All amateurs of novels, and that large class of publications with which the press, both in England and this country, abounds, usually classed as the lighter part of general literature, yet truly valuable in its place, will, we have no doubt, patronise the undertaking, and hail its introduction as a valuable accession to their means of entertainment and instruction. To the distant and interior sections of our country, it should be peculiarly acceptable, as many of the most popular publications are nearly out of date and their places occupied by more favoured rivals, ere they reach the frontier inhabitants of our widely extended empire.

After reading the foregoing, the publisher trusts that the eligibility of his plan will be apparent to all. He has incurred a very heavy expense in getting out this periodical, and has put it at a price to which none can possibly raise a reasonable objection. A new and more distinct type has been cast expressly for the Library, on which it will hereafter be published. By diversifying the contents of the Library, so as not to confine the reader entirely either to Novels, Travels, Tales, or Biography, he hopes to meet the approbation of all persons of literary taste.

GEORGE CRUIKSHANK, ESQ.

Here we have the sketcher sketched; and, as is fit, he is sketched sketching. Here is George Cruikshank, the George Cruikshank, seated upon the head of a barrel, catching inspiration from the scenes presented to him in a pot-house, and consigning the ideas of the moment to immortality on the crown of his hat. We wish that he would send us the results of his easy labours.

Of George Cruikshank the history is short. He stands too often and too well before the eyes of the public, to render it necessary that we should say much about him; and we confess, that of his earlier annals we know little or nothing. This, it must be allowed, is but small reason for a "regular magazine hand" to decline writing a long article about them, according to the usual and much-honoured practice of the well-trained contributors of our worshipful contemporaries. But as we profess to have a conscience, we must not comply with the usage; honestly stating, on the contrary, that the first of Cruikshank's works known to us are his caricatures of George IV. and his friends. Tories as we were and are, and as we trust we still shall be, these comic picturings haunt our imagination. The poor old king in every attitude of ludicrous distress (the "Fat in the Fire" was perfection); Copley (sketched as we have been assured, merely from description, and yet a great likeness); Castlereagh (but even the professed caricaturist could not destroy the gentlemanly grace of that noble face and figure); the "Waterloo-man," with his sword dropping into the scale against the pen; the various parsons, jailers, jockeys, lawyers, and the rest, were first-rate. As Cruikshank himself says of Gilray, "He that did these things was a great man, sir—a very great man, sir!" To Cruikshank, however, they were productive of nothing but the fame of their cleverness and the odium of their politics; as Hone, for whom and his blockhead authors George's talents floated the dire rubbish of the *House that Jack built*, and other witless productions, never paid him for what he had done. In all these stupid productions there were loud puffs of the power of the *press*—George never knew any thing of it when in their hands but as a *screw*.

However, what he did gave him fame and name. We Tory folk were horribly angry at the time, but we soon confessed that the caricaturist was a clever fellow. The trade came to the same conclusion, and work flowed in apace. We rather think he quitted ere long the shabby crew who wished to make him their property, and has settled down, if not into the genuine faith of a Tory, at least into that approach to orthodoxy which consists in the detestation of a Whig. At all events, he does not appear any longer as a political caricaturist; and yet, was there ever a time when there was such an opportunity? Just think of a speech from the woolsack by Lord Brougham, at eleven o'clock at night, or an opening of a budget, or other financial matter, by Lord Althorp, at any hour of the twenty-four. We wish that Cruikshank would wake a little, and show H. B. that, clever as he is, he is not to be allowed a monopoly of depicting the humours or stupidities of Whiggism.

Of course George is, like all other men of undoubted genius, a most ill-used gentleman. As Mathews laments that the general obtuseness of the public will not recognise his talents for tragedy—as Liston mourns over the delusion which applauds him in *Sam Swipes* and *Paul Pry*, and does not permit him to appear as the Damon or Strephon of a sighing opera—so Cruikshank is shocked at the evil fate which consigns him to drawing sketches and caricatures, instead of letting him loose in his natural domain of epic or historical picture. Let him content himself; he can draw what will be held in honoured remembrance when ninety-nine out of every hundred of the great "masters" of our "schools," and a still larger proportion of all the R.A.'s and A. R.A.'s that ever existed, or ever are doomed to exist, will be forgotten. The historical which *he* should cultivate is such as that which appears in his recently published *Sketch-Book*, where, for example, the life of Bonaparte, whether as eagle soaring over the Alps, or eagle chained to a perch, is depicted in all its stages, from artillery lad on watch, through triumph, splendour, and flight, to the little cocked-hatted and round-paunched exile of St. Helena. And so we conclude our thirty ninth article of this series; and he who refuses to subscribe to its truth is a dissenter worse than a pagan.

From Blackwood's Magazine.

MEMOIRS OF M. DE CHATEAUBRIAND.*

NO. IV.

We are now able to fulfil the engagement we entered into with our readers, of presenting them with a fourth article on the subject of these memoirs. We are proud to be able to state, that we have received the passages we have now to communicate direct from Monsieur de Chateaubriand himself. He has done us this honour, and has besides expressed his lively satisfaction on perusing the previous articles we have devoted to his works. We must acknowledge this distinction he has conferred upon us warmly and reverently. When the finest genius, and one of the most illustrious public characters of Europe, thus condescendingly communicates with a foreign periodical, having no impulse or motive thereto but what is furnished by the singular amiability of his disposition, which makes it the continual feast of his life to oblige and gratify all who approach him—when we know that such acts of kindness flow spontaneously from him as water from a spring, and that he possesses—which is proved by the almost adoration with which he is regarded by all parties indiscriminately in France—all those private virtues and winning qualities which soften the splendour of glory, and render it still more lovely than it is dazzling, we feel that we should fail in our duty of rendering honour where honour is due, and still more in doing justice to our own sentiments, if we did not proclaim our sense—

*Continued from Museum, Vol. 25. p. 438.

not so much of the honour done us, though of that we are duly sensible—as of the habitual kindness and cordiality towards all men which characterises Monsieur de Chateaubriand, and which we have no doubt would have led him, independent of any other motive—warmly as we are convinced he sympathises with the great cause we espouse—to favour us as he has done.

As to the idea that Monsieur de Chateaubriand craves our praise, it is absurd. For the last six months he has been absolutely breathing an atmosphere of incense. Almost every writer of distinction in France has felt himself honoured by lavishing the most enthusiastic adulation, we may say, on this freely elected monarch of French literature. Without exaggeration, we may assert that Roman emperors, *grands monarques*, and all the patrons of letters from Mæcenas downwards, have never been regaled with such a full chorus of eulogistic harmony, as has been Monsieur de Chateaubriand, since the first sound of his memoirs issued from the *Abbaye aux Bois*, and was taken up and repeated in a thousand echoes by the whole press of France. In fact, the adulation of which he has been the object looks like the effect of electricity. Brilliant as is his genius, honourable and illustrious as has been his life, they do not account for it; nor can we attribute the spontaneous burst of admiring and affectionate applause and enthusiasm, in which he walks continuously as in a perfumed cloud—like the gods of old when they visited the earth—to any thing but the thrilling emotions, which the genius of the *heart* communicates to all who are permitted to come within its magic circle. After the steam of rich distilled perfumes, therefore, which Monsieur de Chateaubriand has been inhaling for so many months, we feel convinced that any thing we could add would appear vapid and insipid. We can only sincerely admire and applaud, and that in measured terms; but by his own countrymen Monsieur de Chateaubriand has been *glorified*. Nevertheless, when we read such odorous and begemmed passages as the first which we shall lay before our readers, we *do* feel inclined to indulge in an aeronautic flight of praise beyond what is suitable to our northern gravity and phlegm. This passage is preceded by a letter to the gentleman to whom it was communicated, which, as it is in itself very eloquent—for what can its author write that is not so—and shows the value of the favour it confers, we shall previously transcribe. The letter is addressed to M. Ed. Mennechet, and is as follows:—

"I have been much moved, sir, by the letter you did me the honour to write me; nevertheless, I experience some embarrassment in replying to it. Permit me to speak to you with frankness.

"Many persons have already asked for fragments of my *Memoirs*. I do not merit this flattering ardour; but even when I wish to yield to the lively sentiment of gratitude it occasions, I find myself prevented by considerations of some weight. My Memoirs are not destined to appear till after my death; if I make them, therefore, too much known during my life, I abandon my design. I weaken the effect of a diversified and extended work, of which a very false idea must be formed from detached and broken passages. If, for example, I detach one scene of childhood from its successive scenes, it loses the propriety it has in its proper place in the narrative, and retains only its puerility. If I extract a *portrait*, or a *political fragment*, without that which precedes or follows them, the circumstances which justify and introduce them are not perceived. One book of my *Memoirs* may be a voyage; such another rises to poetry; a third narrates a private adventure; a fourth belongs to general history; a fifth is an intimate correspondence, the detail of a congress, an account of an affair of state, a picture of manners, a sketch of a club, of a drawing room, or of a court, &c. &c. &c. All is not then addressed to the same readers, and in this variety one subject makes another pass off.

"You desire particularly to have the passage upon Venice; but, as it is very long, I cannot give the whole of it. You would see then neither the *rencontres* I met with in that city, nor my enquiries about J. J. Rousseau and Lord Byron; the *souvenirs* of my first visit to Venice in 1806, and my last reveries at Lido in 1833, would be no longer mingled with the beauty and melancholy of that wondrous dying city. I do not believe there is in the world an author less infatuated with his works than I am, or who holds them more cheaply; nevertheless, there are some mutilations which cannot be demanded even of the least exacting vanity.

"But now, sir, that I have spoken to you with sincerity, I must prove to you that a Breton can never absolutely refuse a Breton. If I cannot place at your disposition my views *delle fabbriche di Venezia*, I send you a description of the spring in our dear Armorican country; you will be a competent judge of the truth of the picture. I must only tell you, that you have not there all *my* Brittany. There are in the memoirs many other tender recollections of our native heaths—of those heaths where our Duguesclin desired '*that his feats of prowess should be couched in writing, that he might have at least a share of the laurel chaplet of glory, if he could not grasp the whole garland,*'" &c. &c. &c.

We now give the passage alluded to, entitled a "Spring in Brittany."

"The spring in Brittany is milder than in the environs of Paris, and commences three weeks earlier. The five birds which announce it, the swallow, the loriot, the cuckoo, the quail, and the nightingale, arrive with the tepid breezes which harbour in the gulfs of the Armorican peninsula. The earth is then flecked with daisies, hearts-ease, jonquils, butter-cups, hyacinths, ranunculus, and blue-bells, like those abandoned spaces which environ St. John of Lateran, and the Holy Cross of Jerusalem at Rome. The wood glades are variegated with lofty and graceful fern; the fields are stained with flowers, which might be taken for golden butterflies, settling upon green aud azure shrubs. The hedges, along which raspberries and strawberries and the violet abound, are decorated with the eglantine, the white and red hawthorn, the honeysuckle, the convolvulus, the box, the ivy, and scarlet berries, and briers whose brown and crooked branches bear magnificent leaves and fruit. The air is alive with bees and birds; swarms and nests arrest children at every step. The myrtle and the laurel grow in the open air, and the fig ripens as in Provence. Every apple-tree, with its carmine roses, resembles the great bouquet of a village bride.

"The aspect of the country, intersected with ditches, is that of a continual forest, and puts one in mind of England. The low and narrow valleys, where, among hemp-fields and willow-trees, trickle little unnavigable rivers, present the most smiling and solitary perspective. The massive forests terminating the heath plains, inhabited by *sabotiers*, (makers of wooden shoes,) coal-heavers, and glassmakers, having something of the gentleman, the trader, and the savage. The naked lands, the shaven platforms, and the fields red with buck-wheat, which

separate these valleys from each other, make their freshness and delight the greater. Along the coast, light-houses, watch-towers, bell-turrets, Roman works, druidical monuments, and the ruins of chateaux, succeed each other; and the sea bounds the whole prospect.

"Between the land and sea extend sandy plains, an indecisive frontier between the two elements; the field and sea-lark fly there together; the plough and the bark, at a stone-throw distance from each other, furrow the earth and the waters. Sands of different colours, and banks varied by shells and sea-weed, and fringes of silvery foam, mark with white and green the ridges of the wheat-fields. I have seen, in the island of Ceos, an ancient bas-relief which represented sea-nymphs attaching festoons to the bottom of the robe of Ceres.

"In the interior landscapes of the continent, the heavens and the earth behold each other with a motionless aspect; but in maritime prospects, the rolling azure of the waves is enclosed under the fixed azure of the firmament. Hence results a striking contrast. The winter, contemplated from the height of the steep shores, presents a picture of two opposed colours: the snow which whitens the earth blackens the sea.

"To enjoy this rare spectacle, one must see in Brittany the sun, and especially the moon, rise over the forests, and set upon the ocean.

"Established by God, as the sovereign of the abyss, the moon has her clouds, her vapours, her long rays of light, and her shadows, like the sun; but she does not, like it, retire alone; a train of stars accompany her, in proportion as she descends towards the brim of the ocean; she increases her silence, and communicates it to the sea. Soon does she touch the horizon, intersects it, shows only the half of her face, dims, sinks, and disappears, in the soft swellings of a bed of waves. The stars which stand near about their queen, before plunging after her into the bosom of the ocean, hover a moment suspended over the billows and the rocks: eternal beacons of an unknown land. The moon has no sooner set, than an air springing up effaces the image of the constellations, as torches are extinguished after a solemnity."

The above is certainly one of the passages of the memoirs which, as Monsieur de Chateaubriand says himself, rise to poetry. We must now give a few more most interesting fragments. Monsieur de Chateaubriand is speaking in the following one of the friends of his younger days, who have disappeared, one after another, from the earth, "only two or three mummies of past times remaining behind."

"I have seen death close one door upon me after another, which have opened no more. There is no one but myself in the world who preserves in his memory the trace of that society which has for ever disappeared. Twenty times since this epoch I have made the same observation. The impossibility of duration and of length in our human friendships—the profound oblivion which follows us—the invincible silence which takes possession of our tomb, and spreads over our house, remind me continually of the necessity of isolation. Any hand will serve to give us the glass of water we may need in the fever of death. Ah! may it not be one too dear; for how abandon without despair a hand which we have covered with kisses, and would wish to hold eternally on our hearts."

We find the following passage at the conclusion of a detailed account of the ancestors of Monsieur de Chateaubriand.

"Here," he continues, "are many vanities, at an epoch when the past is merely the double infancy of the commencement and the close of life—when a larger view of humanity, and a juster and more elevated sentiment of the dignity of our nature, have urged us beyond the contracted limits of a society of convention—when, thanks be to heaven, education and enlightenment have restored equality, and have caused the individual to resume all his value. But I have been forced to descend to the puerility of these details to describe the character and ruling passion of my father. For the rest, I neither complain of the old nor of the new society. If in the first I was the *Viscount* de Chateaubriand, I am *François* de Chateaubriand in the second; and I have the arrogance or the humility to prefer my Christian name to my title."

We must make a few observations on the passage we have just cited. We confess we can see nothing puerile in recording one's ancestral dignity. The pride of birth is not mere vanity. It is a moral feeling, and one of that elevated and generous order which constitute *the wine of life*. It is a mistake to imagine that this sentiment arises from the worldly advantages with which it is usually accompanied. On the contrary, these form its *alloy*. It is a spiritual affection. It is the same feeling as that which makes us love to contemplate an ancient edifice, or an old ruin. It is one of those fine and subtle affections which shun the touch of gross utilitarian philosophy. This philosophy takes all such for illusions which its zeal is to destroy, and does not perceive that they betray the residence of a hidden fire, compounded with our mortal clay, and are like the spontaneous flame which rises from the burning springs of Dauphiné, which, if quenched for a moment, kindles again of itself, and gives alone interest and radiance to the slaty and rocky soil which generates it. Nobility—or the same thing *deteriorated*—a class of men of another kind above *their fellows*, will ever exist. Wofully, therefore, mistaken is the nation which strives to extinguish the only sentiment which can dignify, and, as it were, spiritualise the qualities of the highest rank in the order of social precedence. Monsieur de Chateaubriand, however, in apologising, or something like it, for making mention of his ancestors, is probably only acquiescing in a fact accomplished, viz. the extinction of the noble order in France. In this sense we can well understand the timidity with which he approaches the subject, and his desire to avoid the scornful glee of those who are too gross and selfish to appreciate any thing but personal advantages, which they vainly imagine to be personal merit. There are other observations which we might make on the above passage, but we think it better to leave them, and proceed with our extracts. Our next shall be a full description of the *Chateau de Combourg*, that severe baronial residence, which filled the infant mind of its describer with visions, and made him familiar with all the beautiful forms of nature, and all the delights of solitary meditation—that source of sensibility which never dries up. It is as follows:—

"Coming from St. Malo, we perceived first a little lake, and the spire of a village church. At the western extremity of this village the towers of the feudal chateau rose among the trees of a forest, brightened by the rays of the setting sun. I have been obliged to stop after these lines. My heart throbbed, so as to agitate my hand, and shake the table on which I write. The re-

collections which rise in my memory overwhelm me with their force and their multitude; but I must not interrupt my narrative. To every suffering its order and its place.

"Having descended the hill, we forded a rivulet, and after advancing half an hour, we quitted the high road; the carriage rolled along a *quincunx*, into an alley of elm-trees, whose branches formed an arch over our heads. I have still present the impression which I felt, the frightened joy I experienced, at the moment I entered under the shade of these trees. Issuing from the obscurity of the wood, we traversed a court planted with walnut trees, reaching to the garden and the house of the overseer; from thence we passed by a folding gate into a grass court, called the *green court*. To the right were a long range of stables, and a chestnut grove; to the left another. At the bottom of the court, which sloped insensibly upwards, stood the chateau, between two clumps of trees. Its severe and sombre *façade* presented a curtain, bearing a covered gallery indented with embrasures. This curtain united two towers, unequal in age, in materials, in height, and thickness, which were terminated by battlements, surmounted by a pointed roof, like a bonnet placed upon a Gothic crown. A few grated windows in the Moorish taste, appeared here and there on the nudity of the walls. A large flight of steps, twenty-nine in number, steep and straight, without railings, replaced the ancient drawbridge over the *fosses*. This reached the gate of the chateau, which was pierced in the middle of the curtain; above this gate were the arms of the lords of Combourg, cut in the stone, and the loop-holes, through which, in former times, the chains of the drawbridge had passed.

"The carriage stopped at the foot of the steps. My father came to meet us. The meeting of the family in the place of his choice so softened his temper, for the moment, that he received us most graciously. We ascended the steps, passed into the vaulted echoing hall, and from this hall into a little interior court. This court was formed by an entrance lodge, and by another lodge parallel to it, which joined together two towers smaller than the first, and, by two other curtains, united the great thick tower to the two little ones. The whole chateau had the figure of a car on four wheels.

"In the little court was a well of immense depth, and opposite to it a turret which contained a spiral granite stair.

"From the interior court, passing into the building which joined the two small towers, we came into a gallery formerly called the guard-room. There was a window at each extremity, and two others in the lateral direction. To widen these four windows it was found necessary to excavate the walls, from eight to ten feet of thickness. Two slanting corridors, like the corridor of the great pyramid, commenced from the two exterior angles of the hall, and led to the two little towers; a stair, winding into one of those towers, established a communication between the guard-room and the upper story. Such was this first lodge.

"That of the *façade* of the great tower on the side of the green court was composed of a sort of *dortoir*, square and sombre rooms, which served for kitchen, hall, and chapel. Above these rooms extended the gallery of *archives*, or of *armour*, or of the *knights*, so called from the painted escutcheons which ornamented its ceiling. The embrasures of the narrow windows of this gallery were so deep, that they formed a kind of cabinets, with walls of granite. Add to all this, in the different parts of the edifice, secret doors and stairs; prisons and dungeons; a labyrinth of corridors, concealed or open; walled subterraneous passages, leading to unknown outlets; and all around, silence, obscurity, and the grim aspect of stone—and you have the Chateau of Combourg before you.

"A plentiful meal taken in the guard-room, where I ate without constraint, terminated the first happy day of my life. True happiness costs little. When it is dear it is not of the right sort.

"Hardly was I awake the next morning when I went to visit the outside views of the chateau, and to celebrate my accession to solitude. The flight of entrance-steps looked to the north and to the west. Seated on it, the green court was in front, and beyond it a kitchen-garden lay between two woods; the one to the right (the *quincunx* by which we had arrived) was called the *little wall*, the other to the left, the *great wall*. This last was a wood of oak, beech, sycamore, elm, and chestnut trees. Madame de Sévigné boasted, in her time, of these ancient shades. Since then a hundred and forty years had been added to their beauty.

"On the other side, towards the south and east, the landscape offered a very different view. From the windows of the great hall were seen the houses of Combourg huddled confusedly together, a basin, the high-road to Rennes which passed by it, a water mill, a meadow in which cows were pasturing, and, separated from the basin by the road, along the meadow, was a little village, depending on a priory founded in 1140 by Ravillon, Lord of Combourg, in which was seen his effigy, armed as a knight, and couched on its back. From the basin the ground rose gradually, and formed an amphitheatre of trees, out of which rose the steeples of the village, and the turrets of gentlemen's villas. From another point of view between the east and north, were seen the heights of Becherel; a terrace, bordered with great clipped box-trees, surrounded the foot of the chateau, passed behind the stables, and, after making many turns, joined the bath garden, which communicated with the *great* wall.

"If after this sketch a painter should take his pencil, would he produce a picture resembling the old chateau. I do not believe he would. Nevertheless, my memory sees the object as if it were before my eyes. Such is, in material things, the impotency of words, and the power of memory. In speaking of Combourg, I sing the first couplets of a complaint, which will charm only myself, and in which nothing will be forgotten or omitted. Ask the Tyrolese goatherd, what charms him in the three or four notes he repeats from morning to evening to his flock. Does he know? No. They are mountain notes, sent from echo to echo, to reverberate from rock to rock, and respond from one bank of a torrent to the other."

We alluded in our last article, on the subject of these memoirs, to a romantic incident which occurred to Monsieur de Chateaubriand on his first sojourn in England, and of his subsequent after-meeting with the party concerned when he was ambassador in London. We do not know whether the following letter, published now, like our other extracts, for the first time, alludes to this circumstance or to another. It shows Monsieur de Chateaubriand in the most amiable and interesting light. It is addressed by the Baron Billing, *Charge d'Affaires* of France at Naples, to Monsieur Jules Janin, who first brought the memoirs to the notice of the public, and is as follows:—

"Sir, you have given us, in the *Revue de Paris*, an admirable article on Monsieur de Chateaubriand; you promise us a second; and it is therefore that I address you at present. It is not in the country of Tasso, and close to the tomb of Virgil, that one can be cold in the worship of genius; besides I will avow that from the day since Providence vouchsafed to bring me into relation with that illustrious man, I have been penetrated with

some indefinable sentiment similar to that which he describes having experienced himself on his interview with Washington. Since that day, I have felt myself vivified by the notice of a great man. This notice has sustained, encouraged and consoled me. It has elevated my soul, enlarged my heart, and developed my talents. Alas! sir, why has not this divine ray brought out a less *mediocre* harmony from the matter it has struck. But the question at present is not as to myself. You must know, then, that at the time of Monsieur de Chateaubriand's embassy to London, he not only honoured me with an interest of which I experienced afterwards the effects, but deigned also to grant me some share of his confidence. Knowing how long I had been habituated to the country in which he represented France, he was accustomed to place in my hands, often without even examination, the letters he received from the interior of England. One day, among those which formed this daily correspondence, there was one, the writing and form of which excited particularly my attention; a certain feminine perfume which exhaled from it made me hesitate a long time to break it open, for I feared some indiscretion on the part of one, whose head, like that of Father Aubry, had not always been bald. Nevertheless, it seemed to me that this paper breathed an odour of innocence and purity. I opened it. It was one of those charming epistles, which Clarissa would have written before her meeting with Lovelace. It was addressed to Monsieur de Chateaubriand, by a young woman whom he had known as a child, whom he had entirely lost sight of since, but who nevertheless (happy privilege of genius!) had preserved the poetic name with which he had christened her in joke. She reminded him of the happy days of her merry infancy, and told him that since then, being grown up, she had contracted a union with a young clergyman which constituted the happiness of her existence. She asked his permission to present to him her husband, but, above all, to thank, in the name of her aged parents, the ambassador of the powerful King of France, for the benefits which the poor author, and *then* unknown, of the *Essay on Revolutions*, had conferred on them. 'You cannot have forgotten,' said she, 'that knowing my parents to be in distress, you compassionated the sufferings you yourself had experienced, and abandoned generously to your humble entertainers, all the profits of a work which you had just published.'

"When I brought this letter to Monsieur de Chateaubriand, and asked him what day I should fix for the young lady to acquit herself of her duty towards him, his features were immediately agitated with that infantine confusion, which you may sometimes have observed in him. He was so confused, that even one of his most sincere admirers was surprised at this new trait of his admirable character.

"I shall never forget, sir, the interview which took place a few days after, when the young Englishwoman, animated by the chaste assurance of virtue, and in the fulfilment of a duty, regarded with a calm and confident look, the timid representative of a great empire, blushing to be caught, as it were, in this manner, in *flagrante delicto*. Then the husband of the young woman, serious as his holy ministry, invoked the divine benediction on the benefactor of his family and his wife. Finally, Monsieur de Chateaubriand, thus powerful, and surrounded by diplomatic pomp, agitated, confused, and stammering a few English words, to stifle the recollection of the good action he had done, when poor, obscure, and solitary, he had generously succoured a family poorer, more obscure, and more isolated than himself.

"I do not know, sir, whether this little incident will not have been omitted in the memoirs which are attracting so much interest at this moment. But if so, it appears to me that it belongs to you to repair this omission. For my part, I shall be most gratified by seeing this anecdote inserted in the next article which we are expecting from your pen, and in drawing it from oblivion, having thus an opportunity of testifying to the illustrious man who is its subject, how much the gratitude which his conduct towards me has inspired, has become even more lively in these days (as the world calls it) of his misfortune, than it was when he was numbered among the powerful of the earth."

We do not know what our readers may think, but this anecdote appears to us to reveal one of the most beautiful traits of character that have ever been brought under our notice. We think not so much of the act of generosity recorded; but that that virgin timidity, that peach-bloom of sensitiveness, which so rarely survives early youth, should embarrass and confuse an ambassador, appears to us as singular as it is delightful.

The next extract we shall give from the *Memoirs* is a parallel between Washington and Bonaparte. This has already been published in the first volume of Travels in America and in Italy, but as it has never been put into an English dress, and forms part of the Memoirs, we think we shall give pleasure to our readers by transcribing it.

"If Washington and Bonaparte are compared, man with man, the genius of the first will seem to take a less lofty flight than that of the second. Washington belongs, not like Bonaparte, to the race of the Alexanders and Cæsars, who surpass the ordinary stature of the human race. He creates no sentiment of astonishment. He is not seen contending on a vast theatre for glory with the greatest captains and most powerful monarchs of the earth. He traverses no seas; he hurries not from Memphis to Vienna, from Cadix to Moscow. His work is the simple one of defending himself, with a handful of citizens, within the narrow circle of domestic hearths, in a land without a past and without celebrity. He gains none of those battles which renew the bloody triumphs of Arbela, and Pharsalia; he puts not his foot upon the necks of kings; he does not say to them, waiting in the vestibule of his palace, 'Qu'ils se font trop attendre et qu' Attila s'ennuie.'

"A certain spirit of silence envelopes the actions of Washington; a slow caution marks them all. One would say that he had ever the sentiment of his great mission within him, and that he feared to compromise it by rashness. His own personal destiny seems not to have entered into the calculation of this hero of a new species. The destinies of his country alone occupied him, and he did not permit himself to risk or gamble with what did not belong to him. But from this profound obscurity what light breaks forth! Seek through the unknown forests where the sword of Washington glittered, and what will you find there? Tombs? No! A world. Washington has left the United States as the trophy of his field of battle.

"Bonaparte possessed no single trait of this grave American. His wars were all waged upon an ancient continent, environed by splendour and stunning with noise. His object was personal glory. His individual destiny filled all his thoughts. He seems to have known that his mission would be short, that the torrent which fell from such a height would quickly expend its force. He hurried forward to enjoy and to abuse his glory, as if aware that it was a fugitive dream of youth. Like the gods of Homer, four steps must suffice him to reach the end of the world. Every shore sees his apparition. His name is inscribed on the records of every nation—but precipitately. In his hurried career he scatters crowns to his family and his soldiers. His monuments, his

laws, his victories, are all the work of haste. Hanging as a portent over the world, with one hand he overthrows kings, and with the other strikes the revolutionary giant to the earth; but in crushing anarchy he stifled liberty, and in the end lost his own on his last field of battle.

"Each of these men has been recompensed according to his works. Washington, after having raised a nation to independence, slept peaceably, as a retired magistrate, under his paternal roof, amid the regrets of his countrymen, and the veneration of all people.

"Bonaparte, having robbed a nation of its independence, was hurled, a dethroned emperor, into exile, and the terrified earth hardly thought him secure enough even under the custody of the ocean. Even whilst, exhausted and chained to a rock, he was struggling with death, Europe dared not lay down her arms in her fear of him. He died; and this event, published at the gate of the palace before which the conqueror had proclaimed so many funerals, hardly arrested the passer by. What, indeed, had citizens to weep for?

"Washington and Bonaparte both arose out of the bosom of a republic; both were born of liberty; the first was faithful to it; the second betrayed it. Their lot will be, according to the different parts they chose, very different with future generations. The name of Washington will spread with liberty from age to age, and make the commencement of a new era for the human race. The name of Bonaparte will be pronounced also by distant generations, but no benediction will be attached to it; it will serve, on the contrary, as an authority to oppressors, great and petty, of all times.

"Washington represented completely the wants, the ideas, the state of enlightenment, and opinions of his epoch. He seconded, instead of thwarting, the advancing movement. He willed that which he ought to have willed—the fulfilment of the mission to which he was called. Hence the coherence and perpetuity of his work. This man who strikes the imagination so slightly, because he was natural, and kept within his just proportions, has confounded his existence with that of his country. His glory is the common patrimony of increasing civilisation. His renown rises like one of those sanctuaries whence a stream, pure and inexhaustible, flows forth for ever for the solace of the people.

"Bonaparte might also have enriched the public domain. His action was on the nation the most civilised, the most intelligent, the most brave, the most brilliant, of the earth. What a rank he would have occupied at present in the universe, if he had joined magnanimity to his other heroic qualities; if, Washington and Bonaparte at the same time, he had nominated liberty the inheritrix of his glory!

"But this disproportioned giant did not completely identify his destiny with that of his country; his genius belonged to the modern, his ambition to ancient, times. He did not perceive that the miracles of his life by far surpassed the value of a diadem, and that this Gothic ornament but ill became him. Sometimes one might see him take a step with the age; at others he would retrograde towards the past. But whether he reascended the stream of time, or followed its course, the prodigious force of his genius seemed to command a flow or a reflux at his will. Men were, in his eyes, only a means of power; there was no sympathy between their welfare and his own. He promised to liberate, and he enchained them. He separated himself from them, and they shrunk back from him. The kings of Egypt built their funeral pyramids, not amid fertile plains, but sterile sands. On a like site has Bonaparte constructed the monument of his renown."

We do not exactly agree with Monsieur de Chateaubriand in his view of the American rebellion, but we will leave disputation, and proceed with what we have further to say of himself. These last few months have been to him fertile in glory; himself and his works have formed the sole topic of all literary conversation; nor can we pass over, on the present occasion, the mention of an event which forms an epoch in his literary life; we mean the representation of his sacred drama, Moses, at Versailles, and afterwards at the Odéon, in Paris. There was some talk of this representation taking place some years ago, in 1829, and a private reading of it was solemnised, we may say—for a solemnity it was considered—at the *Abbaye aux Bois*. Madame Recambies presided at this feast of reason, at which all the literary and fashionable "notables" of Paris were invited to assist. Among others, Monsieur de Barante, Benjamin Constant, Delamartine, and Pasquier, were there, besides ambassadors, dukes, countesses, duchesses, and the whole tribe of blue stocking matrons and damsels. The piece was read by Lafond, of the Comédie Française, and its success with the auditors was great. From all sides nothing was heard but praise. It was a complete classic tragedy. It was Molière revived; it rivaled *Athalie;* and was as original a creation as any of Lord Byron's. In fact, such a chorus of sweet eulogium overwhelmed the modest author, especially from the dulcet voices and pretty applauding palms of the ladies, that he might well exclaim with Voltaire, "Cease, cease, you are stifling me with roses."

In spite, however, of this enthusiastic admiration thus elicited, Monsieur de Chateaubriand had always doubts of the success of his drama. He perceived that the biblical simplicity of the piece, which developes no violent passions, no intricate plot, no love scenes or modern sympathies of any kind, would require great scenic and instrumental pomp and decoration to make it succeed. The printed drama indeed itself indicates this, "The theatre," in one scene it says, "represents the desert of Sinai. On the right is seen the camp of the twelve tribes, among which are perceived camels, dromedaries, horses, sheep, and goats. On the left appears the rock of Oreb struck by Moses, and pouring forth a stream of water; a few palm trees in front; and under these palm trees the bier or tomb of Joseph. The background presents vast plains of sand, dotted over with thickets of aloes; and the whole prospect is bounded on one side by the Red Sea, and on the other by the mounts Oreb and Sinai." It is only natural, therefore, that such expensive scenic preparation being requisite, and that Monsieur de Chateaubriand being no longer ambassador, and so able to command these essential accessories, should have given up all idea of seeing his drama performed. The director of the theatre of Versailles, nevertheless, seized the favourable moment when the name of Monsieur de Chateaubriand was on the tip of every tongue, to try the experiment of a representation. An interesting correspondence between the director and the author took place on the subject, in which the latter refuses his consent to the attempt, and declares he will be in no way a party to it. The representation, notwithstanding, took place, and a gala-

day, or rather night, it was at Versailles. The theatre was crowded. The whole quartier of St. Germain hurried to the spectacle. Madame de Recambies was there, and all the former auditors of the *Abbaye aux Bois*. Among others, we observed Monsieur and Madame de Guiche, Monsieur Bertin, the directing editor of the *Journal des Debats*, Madame Sophie Gay, and all the actors and actresses of the Comédie Français. But Monsieur de Chateaubriand was not there; he remained in Paris; and we are persuaded that whilst his drama was performing, he was enjoying as sound and unbroken a sleep as if he were in no way concerned in its success or its failure.

Fail, however, it did not; but its success was not of that enthusiastic kind which many of its admirers had anticipated for it. The reason why it could make no very striking impression, we have already hinted at. Nevertheless, it was received very favourably. Yet we cannot help thinking, that respect for the author did more to fix and retain the attention of the audience, than the *dramatic* merit of the piece. We say *dramatic* merit, for we think that in this, from the very nature of the subject, it is deficient. Lyrical merit it has, we confess, and of a very high order; and the whole work is so truly poetic, that if the subject matter did not repel us, we could read it with very great delight. But the subject, we must freely declare, *does* repel us. We cannot consent to confound together the religions of Jupiter and Jehovah, by consigning them equally to the regions of fiction. We cannot approve of borrowing topics from the pulpit for the stage. The events of scriptural history are to us *truths* solid and solemn as the firmament. We will not behold them through the prism of imagination, for we know that so they are only distorted or seen double. They are to us *sacred*, and that in no trite or canting acceptation of the term, but as the only sources of our moral life and immortal hopes. We will then distinguish and separate them, scrupulously and zealously, from all the *profane* associations with which we are surrounded. We will not take the fire from off the altar to ignite the spirit in a punch-bowl. We know very well, however, that these sentiments belong to a protestant view of revelation. We have, therefore, been unduly severe, perhaps, on Monsieur de Chateaubriand, in the observations we have thought it our duty to make. We are perfectly well aware that he has the merit, the unappreciable merit, of *reconciling* (what a word!) his countrymen to Christianity, by showing them how full it is of poetic beauty and purifying emotions. Sacred dramas may consequently—we write it not irreverently—form, as Doctor O'Toole says in the farce, "a part of his system." But we, thank God! have got beyond the need of these specious arts of reconcilement. Our part it is to keep revelation pure, pure as much from the meretricious colourings of poetry, as from the ignorant adulterations of superstition. We love it *as it is*—in its sober simplicity.

We hope these concluding observations will show Monsieur de Chateaubriand that our praises have at least this value, that they are discriminating; and that much as we admire and reverence his genius and character, we suffer not these sentiments—warm as they are—to interfere with the expression of our honest convictions, even when they may be opposed to his own.

O. D.

From the New Monthly Magazine.

PEDLAR KARL,

AT LEBANON SPRINGS.

"Which manner of digression, however some dislike as frivolous and impertinent, yet I am of Beroaldus his opinion, such digressions do mightily delight and refresh a weary reader; they are like sauce to a bad stomach, and I therefore do most willingly use them."—BURTON.

I am not sure whether Lebanon Springs, the scene of a romantic story I am about to tell, belong to New York or Massachusetts. It is not very important, to be sure, in a country where people take Vermont and Patagonia to be neighbouring states, but I have a natural looseness in geography which I take pains to mortify by exposure. Very odd! that I should not remember more of the spot where I took my first lessons in philandering—where I first saw you, brightest and most beautiful A. D. (not *Anno Domini*), in your white morning frocks and black French aprons!

Lebanon Springs are the rage about once in three years. I must let you into the secret of these things, gentle reader, for perhaps I am the only individual existing who has penetrated the mysteries of the four dynasties of American fashion. In the fourteen millions of inhabitants in the United States, there are precisely four authenticated and undisputed aristocratic families. There is one in Boston, one in New York, one in Philadelphia, and one in Baltimore. By a blessed providence they are not all in one state, or we should have a civil war and a monarchy, in no time. With two hundred miles' interval between them, they agree passably, and generally meet at one or another of the three watering-places of Saratoga, Ballston, or Lebanon. Their meeting is as mysterious as the process of crystallisation, for it is not by agreement. You must explain it by some theory of homæopathy or magnetism. As it is not known till the moment they arrive, there is of course great excitement among the hotel-keepers in these different parts of the country, and a village that has ten thousand transient inhabitants one summer, has, for the next, scarce as many score. The vast and solitary temples of Pæstum are gay in comparison with these halls of disappointment.

As I make a point of dawdling away July and August in this locomotive metropolis of pleasure, and rather prefer Lebanon, it is always agreeable to me to hear that the nucleus is formed in that valley of hemlocks. Not for its scenery, for if there is one thing in this universe of ennui that bores me more than a man who is neither rich nor witty, it is "nature." That is why I like Europe; you never hear of it this side the water in man, woman, or landscape; and really, my dear Eastern-hemispherian! you that are accustomed to what is called nature in England (to

wit, a soft park, with a gray ruin in the midst), have little idea how wearily upon heart and mind presses a waste wilderness of mere forest and water, without stone or story. Trees in England have characters and tongues; if you see a fine one, you know whose father planted it, and for whose pleasure it was designed, and about what sum the man must possess to afford to let it stand. They are statistics, as it were—so many trees, *ergo*, so many owners so rich. In America, on the contrary, trees grow and waters run, as the stars shine, quite unmeaningly; there may be ten thousand princely elms, and not a man within a hundred miles worth five pounds five. You ask, in England, who has the privilege of this water? or you say of an oak, that it stood in such a man's time: but with us, water is an element unclaimed and unrented, and a tree dabbles in the clouds as they go over, and is like a great idiot, without soul or responsibility. I told Miss Martineau so, and yet she persisted she should be delighted with our American forests. Introduce me to a drawing-room, full of wax figures larger than life, and I shall find them like men and women as soon.

If Lebanon *had* a history, however,—if it *had* been the scene of much human vice and little human virtue, like other spots of earth,—if Bulwer (who is seen in apotheosis on the other edge of the great scroll of the Atlantic) had looked on it with his creative eye, and poets, with critics who are brother editors of Quarterlys, had sprung, flourished and died within its mountainous horizon,—if, in short, bad poems had been written, and much praised there, and lovely women been made lovelier by a deifying rank and more deifying fortune,—if the ruins of a robber's stronghold stood on the shoulder of one hill, and the walls of a nunnery, suppressed for licentiousness, on the slope of another,—then, I think, Lebanon would have been a spot for a pilgrimage, for its *natural* beauty. It is shaped like a lotus, with one leaf laid back by the wind. It is a great green cup, with a scoop for a drinking-place. As you walk in the long porticoes of the hotel, the dark forest mounts up before you like a leafy wall, and the clouds seem just to clear the pine tops, and the eagles sail across from horizon to horizon, without lifting their wings, as if you saw them from the bottom of a well. People born there think the world about two miles square, and hilly.

The principal charm of Lebanon to me is the village of "Shakers," lying in a valley about three miles off. As Glaucus wondered at the inert tortoise of Pompeii, and loved it for its antipodal contrast to himself, so do I *affection* (a French verb that I beg leave to introduce to the English language) the shaking quakers. That two thousand men could be found in the New World, who would embrace a religion enjoining a frozen and unsympathetic intercourse with the diviner sex, and that an equal number of females could be induced to live in the same community, without locks or walls, in the cold and rigid observance of a creed of celibacy, is to me an inexplicable and grave wonder. My delight is to get into my stanhope after breakfast, and drive over and spend the forenoon in contemplating them at their work in the fields. They have a peculiar and most expressive physiognomy; the women are pale, or of a wintry redness in the cheek, and are all attenuated and spare. Gravity, deep and habitual, broods in every line of their thin faces. They go out to their labour in company with those serious men, and are never seen to smile. Their eyes are all hard and stony, their gait is precise and stiff, their voices are of a croaking hoarseness, and nature seems dead in them. I would you bake such men and women in a brick-kiln.

Do they think the world is coming to an end? Are there to be no more children? Is Cupid to be thrown out of business, like a coach proprietor on a rail-road? What can the shakers mean, I should be pleased to know?

The oddity is that most of them are young. Men of from twenty to thirty, and women from sixteen to twenty-five, and often, spite of their unbecoming dress, good-looking and shapely, meet you at every step. Industrious, frugal, and self-denying they certainly are, and there is every appearance, that their tenets of difficult abstinence are kept to the letter. There is little temptation beyond principle to remain, and they are free to go and come as they list, yet there they live on in peace and unrepining industry, and a more thriving community does not exist in the republic. Many a time have I driven over on a Sunday, and watched those solemn virgins dropping in one after another to the church; and when the fine-limbed and russet-faced brotherhood were swimming round the floor in their fanatical dance, I have watched their countenances for some look of preference, some betrayal of an ill-suppressed impulse, till my eyes ached again. I have selected the youngest and fairest, and have not lost sight of her for two hours, and she might have been made of cheese-parings for any trace of emotion. There is food for speculation in it. Can we do without matrimony? Can we "strike," and be independent of these dear delightful tyrants, for whom we "live and move and have our being?" Will it ever be no blot on our scutcheon to have attained thirty-five as an unfructifying unit? Is that fearful campaign, with all its embarrassments and awkwardnesses, and inquisitions into your money and morals, its bullyings and backings-out—is it evitable?

Lebanon has one other charm. Within a morning drive of the springs lies the fairest village it has ever been my lot to see. It is English in its character, except that there is really nothing in this country so perfect of its kind. There are many towns in the United States more picturesquely situated, but this, before I had been abroad, always seemed to me the very ideal of English rural scenery, and the kind of place to set apart for either love or death—for one's honeymoon or burial, the two periods of life which I have always hoped would find me in the loveliest spot of nature. Stockbridge lies in a broad sunny valley, with mountains at exactly the right distance, and a river in its bosom that is as delicate in its windings, and as suited to the charms it

wanders among, as a vein in the transparent neck of beauty. I am not going into a regular description, but I have carried myself back to Lebanon, and the remembrance of the leafy mornings of summer in which I have driven to that fair earthly paradise, and loitered under its elms, imagining myself amid the scenes of song and story in distant England, has a charm for me now. I have seen the mother-land; I have rambled through park, woodland, and village, wherever the name was old and the scene lovely, and it pleases me to go back to my dreaming days and compare the reality with the anticipation. Most small towns in America have traces of *new*-ness about them. The stumps of a clearing, or freshly boarded barns—something that is the antipodes of romance—meets your eye from every aspect. Stockbridge, on the contrary, is an old town, and the houses are of a rural structure, the fields look soft and genial, the grass is sward-like, the bridges picturesque, the hedges old, and the elms, nowhere so many and so luxuriant, are full grown and majestic. The village is embowered in foliage.

Greatest attraction of all, the authoress of "Redwood" and "Hope Leslie," a novelist of whom America has the good sense to be proud, is the Miss Mitford of Stockbridge. A *man*, though a distinguished one, may have little influence on the town he lives in, but a remarkable *woman* is the invariable cynosure of a community, and irradiates it all. I think I could divine the presence of one almost by the growing of the trees and flowers. "Our Village" does not look like other villages.

You will have forgotten that I had a story to tell, dear reader. I was at Lebanon in the summer of —— (perhaps you don't care about knowing exactly when it was, and in that case I would rather keep shy of dates in a periodical; I please myself with the idea that time gets on faster than I.) The Springs were thronged. The president's lady was there, (this was under our administration, the Adams') and all the four *cliques* spoken of above were amicably united—each others' beaux dancing with each others' belles, and so on. If I were writing merely for American eyes, I should digress once more to describe the distinctive characters of the south, north, and central representations of beauty; but it would scarcely interest the general reader. I may say, in passing, that the Boston belles were *à l'Anglaise*, rosy and *riant*; the New Yorkers, like Parisians, cool, dangerous, and dressy; and the Baltimoreans (and so south), like Ionians or Romans, indolent, passionate, lovely, and languishing. Men, women, and pine apples, I am inclined to think, flourish with a more kindly growth in the fervid latitudes.

The campaign went on, and a pleasant campaign it was—for the parties concerned had the management of their own affairs; *i. e.* they who had hearts to sell made the bargain for themselves, (this was the greater number,) and they who disposed of that commodity gratis, though necessarily young and ignorant of the world, made the transfer in the same manner, in person. That is your true republic. The trading in affections by reference—the applying to an old and selfish heart for the purchase of a young and ingenuous one—the swearing to your rents, and not to your faithful passion—to your settlements, and not your constancy—the cold distance between yourself and the young creature who is to lie in your bosom, till the purchase-money is secured,—and the hasty marriage and sudden abandonment of a nature thus chilled and put on its guard, to a freedom with one almost a stranger, that cannot but seem licentious, and cannot but break down that sense of propriety in which modesty is most strongly entrenched—this seems to me the *one* evil of your old worm-eaten monarchies this side the water, which touches the essential happiness of the well bred individual. Taxation and oppression are but things he reads of in the morning paper.

This freedom of intercourse between unmarried people has a single disadvantage,—one gets so desperately soon to the end of the chapter! There shall be two hundred young ladies at the Springs in a given season, and, by the difference in taste so wisely arranged by Providence, there will scarce be, of course, more than four in that number whom any one gentleman at all difficult will find within the range of his *beau ideal*. With those four he may converse freely twelve hours in the day—more, if he particularly desires it. They may ride together, drive together, ramble together, sing together, be together from morning till night, and at the end of a month passed in this way, if he escape a committal, as is possible, he will know all that are agreeable, in one large circle at least, as well as he knows his sisters—a state of things that is very likely to end in his going abroad soon, from a mere dearth of amusement. I have imagined, however, the case of an unmarrying idle man, a character too rare as yet in America to affect the general question. People marry as they die in that country—when their time comes. *We must all marry* is as much an axiom as *we must all die*, and eke as melancholy.

Shall we go on with the story? I had escaped for two blessed weeks, and was congratulating the susceptible gentleman under my waistcoat pocket that we should never be in love with less than the whole sex again, when a German Baron Von —— arrived at the Springs with a lame daughter. She was eighteen, transparently fair, and, at first sight, so shrinkingly dependent, so delicate, so child-like, that attention to her assumed the form almost of pity, and sprang as naturally and unsuspectingly from the heart. The only womanly trait about her was her voice, which was so deeply soft and full, so earnest and yet so gentle, so touched with subdued pathos and yet so melancholy calm, that if she spoke after a long silence, I turned to her involuntarily with the feeling that she was not the same,—as if some impassioned and eloquent woman had taken unaware the place of the simple and petted child.

I am inclined to think there is a particular tenderness in the human breast for lame women. Any other deformity in the gentler sex is monstrous; but lameness (the Devil's defect) is "the devil." I picture myself, to my own eye now—pacing those ricketty colonnades at Lebanon with the gentle Meeta hanging heavily, and with the

dependence inseparable from her infirmity, on my arm, while the moon (which was the moon of the Rhine to *her*, full of thrilling and unearthly influences) rode solemnly up above the mountain tops. And that strange voice, filling like a flute with sweetness as the night advanced, and that irregular pressure of the small wrist in her forgotten lameness, and my own (I thought) almost paternal feeling as she leaned more and more heavily, and turned her delicate and fair face confidingly up to mine, and that dangerous mixture altogether of childlikeness and womanly passion, of dependence and superiority, of reserve on the one subject of love, and absolute confidence on every other—if I had not a story to tell, I could prate of those June nights and their witcheries till you would think

"Tutti gli alberi del mondo
Fosseio penne,"

and myself "bitten by the dipsas."

We were walking one night late in the gallery running around the second story of the hotel. There was a ball on the floor below, and the music, deadened somewhat by the crowded room, came up softened and mellowed to the dark and solitary colonnade, and added to other influences in putting a certain lodger in my bosom beyond my temporary control. I told Meeta that I loved her.

The building stands against the side of a steep mountain high up above the valley, and the pines and hemlocks at that time hung in their primeval blackness almost over the roof. As the most difficult and embarrassed sentence of which I had ever been delivered died on my lips, and Meeta, lightening her weight on my arm, walked in apparently offended silence by my side, a deep-toned guitar was suddenly struck in the woods, and a clear, manly voice broke forth in a song. It produced an instant and startling effect on my companion. With the first word she quickly withdrew her arm; and, after a moment's pause, listening with her hands raised in an attitude of the most intense eagerness, she sprang to the extremity of the balustrade, and gazed breathlessly into the dark depths of the forest. The voice ceased, and she started back, and laid her hand hastily on my arm.

"I must go," she said, in a voice of hurried feeling; "if you are generous, stay here and await me!" and in another moment she sprang along the bridge connecting the gallery with the rising ground in the rear, and was lost in the shadows of the hemlocks.

I have made a declaration, thought I, just five minutes too soon.

I paced up and down the now *too* lonely colonnade, and picked up the fragments of my dream with what philosophy I might. By the time Meeta returned, perhaps a half hour, perhaps an age, as you measure by her feelings or mine, I had patched up a very pretty and heroical magnanimity. She would have spoken, but was breathless.

"Explain nothing," I said, taking her arm within mine, "and let us mutually forget. If I can serve you better than by silence, command me entirely. I live but for your happiness,—even," I added after a pause, "though it spring from another."

We were at her chamber door. She pressed my hand with a strength of which I did not think those small slight fingers capable, and vanished, leaving me, I am free to confess, less resigned than you would suppose from my last speech. I had done the dramatic thing, thanks to much reading of you, dear Barry Cornwall! but it was not in a play. I remained killed after the audience was gone.

The next day a new character appeared on the stage.

"*Such* a handsome pedlar!" said magnificent Helen ——— to me, as I gave my horse to the groom, after a ride in search of hellebore, and joined the promenade at the well: "and what do you think? he sells only by raffle! It's so nice! All sorts of Berlin iron ornaments, and every thing German and sweet; and the pedlar's smiles worth more than the prizes; and *such* a moustache! See! there he is! and now, if he has sold all his tickets,—will you come, Master Gravity?"

"I hear a voice you cannot hear," thought I, as I gave the beauty my arm, and joined a crowd of people gathered about a pedlar's box in the centre of the parterre.

The itinerant vender spread his wares in the midst of the gay assemblage, and the raffle went on. He was excessively handsome. A head of the sweet gentleness of Raphael's, with locks flowing to his shoulders in the fashion of the German students, a soft brown moustache curving on a short Phidian upper lip, a large blue eye expressive of enthusiasm rather than passion, and features altogether purely intellectual, formed a portrait with which even jealousy might console itself. Through all the disadvantages of a dress suited to his apparent vocation, an eye the least on the alert for a disguise would have penetrated his in a moment. The gay and thoughtless crowd about him, not accustomed to impostors who were *more* than they pretended to be, trusted him for a pedlar, but treated him with a respect far above his station insensibly.

Whatever his object was, so it were honourable, I inly determined to give him all the assistance in my power. A single glance at the face of Meeta, who joined the circle as the prizes were drawn,—a face so changed since yesterday, so flushed with hope and pleasure, and yet so saddened by doubt and fear, the small lips compressed, the soft black eye kindled and restless, and the red leaf on her cheek deepened to a feverish beauty,—left me no shadow of hesitation. I exchanged a look with her that I intended should say as much.

I know nothing that gives one such an elevated idea of human nature (in one's own person) as helping another man to a woman one loves. Oh last days of minority or thereabouts! oh primal manhood! oh golden time, when we have let go all but the enthusiasm of the boy, and seized hold of all but the selfishness of the man! oh blessed interregnum of the evil and stronger genius! why can we not bottle up thy hours like the wine of a better vintage, and enjoy them in the parched

world-weariness of age! In the tardy honeymoon of a bachelor (as mine will be, if it come ever, alas!) with what joy of paradise should we bring up from the cellars of the past a hamper of that sunny Hippocrene!

Pedlar Karl and "the gentleman in No. 10" would have been suspected in any other country of conspiracy. (How odd that the highest crime of a monarchy, the attempt to supplant the existing ruler, becomes in a republic a creditable profession! You are a *traitor* here, a *politician* there!) We sat together from midnight onwards, discoursing in low voices over sherry and sandwiches, and in that crowded Babylon, his entrances and exits required a very conspirator-like management. Known as my friend, his trade and his disguise were up. As a pedlar, wandering about where he listed when not employed over his wares, his interviews with Meeta were easily contrived, and his lover's watch, gazing on her through the long hours of the ball from the crowd of villagers at the windows, hovering about her walks, and feeding his heart on the many, many chance looks of fondness given him in every hour in that out-of-doors society, kept him comparatively happy.

"The baron looked hard at you to-day," said I, as he closed the door in my little room, and sat down on the bed.

"Yes; he takes an interest in me as a countryman, but he does not know me. He is a dull observer, and has seen me but once in Germany."

"How, then, have you known Meeta so long?"

"I accompanied her brother home from the university, when the baron was away, and for a long month we were seldom parted. Riding, boating on the Rhine, watching the sunset from the bartizan of the old castle towers, reading in the old library, rambling in the park and forest—it was a heaven, my friend, than which I can conceive none brighter!"

"And her brother?"

"Alas! changed! We were both boys then, and a brother is slow to believe his sister's beauty dangerous. He was the first to shut the doors against me, when he heard that the poor student had dared to love his high-born Meeta." Karl covered his eyes with his hand, and brooded for a while in silence on the remembrances he had awakened.

"Do you think the baron came to America purposely to avoid you?"

"Partly, I have no doubt, for I entered the castle one night in my despair, when I had been forbidden entrance, and he found me at her feet in the old corridor. It was the only time he ever saw me, if, indeed, he saw me at all in the darkness, and he immediately hastened his preparations for a long contemplated journey, I knew not whither."

"Did you follow him soon?"

"No, for my heart was crushed at first, and I despaired. The possibility of following them in my wretched poverty did not even occur to me for months."

"How did you track them hither, of all places in the world?"

"I sought them first in Italy. It is easy on the continent to find out where persons are *not*, and after two years' wanderings, I heard of them in Paris. They had just sailed for America. I followed: but in a country where there are no passports, and no *espionage*, it is difficult to trace the traveller. It was probable only that they would be at a place of general resort, and I came here with no assurance but hope. Thanks to God, the first sight that greeted my eyes was my dear Meeta, whose irregular step, as she walked back and forth with you in the gallery, enabled me to recognise her in the darkness."

Who shall say the days of romance are over? The plot is not brought to the catastrophe, but we hope it is near.

My aunt, Isabella Slingsby, (now in heaven, with the "eleven thousand virgins," God rest her soul!) was at this time, as at all others, under my respectable charge. She would have said I was under hers—but it amounts to the same thing—we lived together in peace and harmony. She said what she pleased, for I loved her—and I *did* what I pleased, for she loved me. When Karl told me that Meeta's principal objection to an elopement was the want of a matron, I shut the teeth of my resolution, as they say in Persia, and inwardly vowed my unconscious aunt to this exigency. You should have seen Miss Isabella Slingsby, to know what a desperate man may be brought to resolve on.

On a certain day, Count Von Raffle-off (as my witty friend and ally, Tom Fane, was pleased to call the handsome pedlar,) departed with his pack, and the hearts of all the dressing-maids and some of their mistresses, on his way to New York. I drove down the road to take my leave of him out of sight, and give him my last instructions.

How to attack my aunt was a subject about which I had many unsatisfactory thoughts. If there was one thing she disapproved of more than another it was an elopement; and with what face to propose to her to run away with a baron's only daughter, and leave her in the hands of a pedlar, taking upon herself, as she must, the whole sin and odium, was an enigma I ate, drank, and slept upon, in vain. One thing at last became very clear—she would do it for nobody but *me*. *Sequitur*, I must play the lover myself.

I commenced with a fit of illness. What *was* the matter! For two days I was invisible. Dear Isabella! it was the first time I had ever drawn seriously on thy fallow sympathies, and how freely they flowed at my affected sorrows, I shame to remember! Did ever woman so weep? Did ever woman so take antipathy to man as she at that innocent old baron for his supposed refusal of his daughter to Philip Slingsby? This revival of the remembrance shall not be in vain. The mignonette and roses planted above thy grave, dearest aunt, shall be weeded anew!

Oh that long week of management and hypocrisy! The day came at last.

"Aunt Bel!"

"What, Philip, dear?"

"I think I feel better to-day."

"Yes?"

"Yes. What say you to a drive? There is the stanhope."

"My dear Phil, don't mention that horrid stanhope. I am sure, if you valued my life"—

"Precisely, aunt—(I had taken care to give her a good fright the day before)—But Tom Fane has offered me his ponies and Jersey wagon, and that, you know, is the most quiet thing in the world, and holds four. So, perhaps ——ehem!——you'll———ask Meeta?"

"Um! Why, you see, Philip"—

I saw at once that, if it got to an argument, I was *perdu*. Miss Slingsby, though a sincere Christian, never *could* keep her temper when she tried to reason. I knelt down on her cricket, smoothed away the false hair on her forehead, and kissed her. It was a fascinating endearment of mine that I only resorted to on great emergencies. The hermit tooth in my aunt's mouth became gradually visible, heralding what in youth had been a smile; and as I assisted her in rolling up her embroidery, she looked on me with an unsuspecting affection that touched my heart. I made a silent vow that if she survived the scrape into which she was being inveigled, I would be to her, and her dog Whimsiculo, (the latter my foe and my aversion,) the soul of exemplary kindness for the remainder of their natural lives. I lay the unction to my soul that this vow was kept. My aunt blessed me shortly before she was called to "walk in white" (she had hitherto walked in yellow); and as it would have been unnatural in Whimsiculo to survive her, I considered his "natural life" as ended with hers, and had him peacefully strangled on the same day. He lies at her feet as usual, a delicate attention of which (I trust in Swedenborg) her spirit is aware.

With the exception of "Tom Thumb" and "Rattler," who were of the same double-jointed family of interminable wind and bottom, there was never perhaps such a pair of goers as Tom Fane's ponies. My aunt had a lurking hope, I believe, that the baron would refuse Meeta permission to join us, but either he did not think me a dangerous person (I have said before he was a dull man), or he had no objection to me as a son-in-law, which my aunt and myself (against the world) would have thought the natural construction upon his indifference. He came to the end of the colonnade to see us start, and as I eased the ribands and let the ponies off like a shot from a cross-bow, I stole a look at Meeta. The colour had fled from cheek and lip, and the tears streamed over them like rain. Aunt Bel was on the back-seat, *grace à Dieu!*

We met Tom at the foot of the hill, and I pulled up. He was the *best* fellow, that Tom Fane!

"Ease both the bearing reins," said I, "I am going up the mountain."

"The devil you are!" said Tom, doing my bidding, however; "you'll find the road to the Shakers much pleasanter. What an odd whim! It's a perpendicular three miles, Miss Slingsby. I would as lief be hoisted up a well and let down again. Don't go that way, Phil, unless you are going to run away with Miss Von ——."

"Many a shaft at random sent,"

thought I, and waving the tandem lash over the ears of the ponies, I brought up the silk on the cheek of their malaprop master, and spanked away up the hill, leaving him in a rage like to get a fresh supply of fuel by dinner time. Tom was of a plethoric habit, and if I had not thought he could afford to burst a blood-vessel better than two lovers to break their hearts, I should not have ventured on the bold measure of borrowing his horses for an hour and keeping them a week. We have shaken hands upon it since, but it is my private opinion that he has never forgiven me in his heart.

As we wound slowly up the mountain, I gave Meeta the reins, and jumped out to gather some wild flowers for my aunt. Dear old soul! the attention reconciled her to what she considered a very unwarrantable caprice of mine. What I *could* wish to toil up that steep mountain for! Well! the flowers *are* charming in these high regions!

"Don't you see my reason for coming then, aunt Bella?"

"*Was* it for that, dear, Philip?" said she, putting the wild flowers affectionately into her bosom, where they bloomed like broidery on saffron tapestry. "How considerate of you!" And she drew her shawl around her, and was at peace with all the world. So easily are the old made happy by the young! Reader, I scent a moral in the air!

We were at the top of the hill. If I was sane, my aunt was probably thinking, I should turn here and go back. To descend the other side, and reascend and descend again to the Springs, was hardly a sort of thing one would do for pleasure.

"Here's a good place to turn, Philip," said she, as we entered a smooth broad hollow on the top of the mountain.

I dashed through it as if the ponies were shod with *talaria*. My aunt said nothing, and luckily the road was very narrow for a mile, and she had a horror of a short turn. A new thought struck me.

"Did you ever know, aunt, that there was a way back around the foot of the mountain?"

"Dear, no; how delightful! Is it far?"

"A couple of hours or so; but I can do it in less. We'll try;" and I gave the sure-footed Canadians the whip, and scampered down the hills as if the rock of Sysiphus had been rolling after us.

We were soon over the mountain-range, and the road grew better and more level. Oh, how fast pattered those little hoofs, and how full of spirit and excitement looked those small ears, catching the lightest chirrup I could whisper, like the very spell of swiftness. Pines, hemlocks and cedars, farm-houses and milestones, flew back like shadows. My aunt sat speechless in the middle of the back-seat, holding on with both hands in apprehensive resignation! She expected soon to come in sight of the Springs, and had doubtless taken a mental resolution, that if, please God, she once more found herself at home, she would never "tempt Providence" (it was a favourite expression of hers) by trusting herself

again behind such a pair of fly-away demons. As I read this thought in her countenance by a stolen glance over my shoulder, we rattled into a village distant from Lebanon twenty miles.

"There, aunt," said I, as I pulled up at the door of the inn; "we have nearly described a circle. Now, don't speak! if you do you'll start the horses. There's nothing they are so much afraid of as a woman's voice. Very odd, isn't it? We'll just sponge their mouths now, and be at home in the crack of a whip. Five miles more only. Come!"

Off we sped again like the wind, and Bel just venturing to wonder whether the horses would'nt *rather* go slower. Meeta had hardly spoken. She had thoughts of her own to be busy with, and I pretended to be fully occupied with my driving. The nonsense I talked to those horses, to do away the embarrrssment of her silence, would convict me of insanity before any jury in the world.

The sun began to throw long shadows, and the short-legged ponies figured like flying giraffes along the retiring hedges. Luckily, my aunt had very little idea of conjecturing a course by the points of the compass. We sped on gloriously.

"Philip, dear! havn't you lost your way? It seems to me we've come more than five miles since you stopped," (ten at least,) "and I don't see the mountains about Lebanon at all!"

"Don't be alarmed, aunty, dear! We're very high just here, and shall *drop down* on Lebanon as it were. Are *you* afraid, Meeta?"

"*Nein!*" she answered. She was thinking in German, poor girl, and heart and memory were wrapped up in the thought.

I drove on almost cruelly. Tom's incomparable horses justified all his eulogiums; they were indefatigable. The sun blazed a moment through the firs, and disappeared, the gorgeous changes of eve came over the clouds, the twilight stole through the damp air with its melancholy gray, and the whip-poor-wills, birds of evening, came abroad, like gentlemen in debt, to flit about in the darkness. Every thing was saddening. My own volubility ceased; the whiz of the lash, as I waved it over the heads of my foaming ponies, and an occasional "Steady!" as one or the other broke into a gallop, were the only interruptions to the silence. Meeta buried her face in the folds of her shawl, and sat closer to my side, and my aunt, soothed and flattered by turns, believed and doubted, and was finally persuaded by my ingenious and well-inserted fibs, that it was only somewhat farther than I anticipated, and we should arrive "presently."

Somewhere about eight o'clock the lights of a town appeared in the distance, and, straining every nerve, the gallant beasts whirled us in through the streets, and I pulled up suddenly at the door of an hotel.

"Why, Philip!" said my aunt, in a tone of unutterable astonishment, looking about her as if she had awoke from a dream, "This is Hudson!"

It was too clear to be disputed. We were upon the North River, forty miles from Lebanon, and the steamer would touch at the pier in half an hour. My aunt was to be one of the passengers to New York, but she was yet to be persuaded of it; the only thing now was to get her into the house, and enact the scene as soon as possible.

I helped her out as tenderly as I knew how, and, as we went up stairs, I requested Meeta to sit down in a corner of the room, and cover her face with her handkerchief. When the servant was locked out, I took my aunt into the recess of the window, and informed her, to her very great great surprise, that she had run away with the baron's daughter.

"Philip Slingsby!"

My aunt was overcome. I had nothing for it but to be overcome too. She sunk into one chair, and I into the other, and burying my face in my hands, I looked through my fingers to watch the effect. Five mortal minutes lasted my aunt's wrath; gradually, however, she began to steal a look at me, and the expression of resentment about her thin lips softened into something like pity.

"Philip!" said she, taking my hand.

"My dear aunt!"—"What is to be done?"

I pointed to Meeta, who sat with her head on her bosom, pressed my hand to my heart, as if to suppress a pang, and proceeded to explain. It seemed impossible for my aunt to forgive the deception of the thing. Unsophisticated Isabella! If thou hadst known that thou wert, even yet, one fold removed from the truth,—if thou couldst have divined that it was not for the darling of thy heart that thou wert yielding a point only less dear to thee than thy maiden reputation,—if it could have entered thy region of possibilities that thine own house in town had been three days aired for the reception of a bride, run away with by thy ostensible connivance, and all for a German pedlar, in whose fortunes and loves thou hadst no shadow of interest, I think the brain of thee would have turned, and the dry heart in thy bosom have broken with surprise and grief!

I wrote a note to Tom, left his horses at the inn, and at nine o'clock we were steaming down the Hudson, my aunt in bed, and Meeta pacing the deck with me, and pouring forth her fears and her gratitude in a voice of music that made me almost repent my self-sacrificing enterprise. I have told the story gaily, gentle reader! but there was a nerve ajar in my heart while its little events went on.

How we sped thereafter, dear reader!—how the consul of his majesty of Prussia was persuaded by my aunt's respectability to legalise the wedding by his presence,—how my aunt fainted dead away when the parson arrived, and she discovered who was *not* to be the bridegroom, and who *was*,—how I persuaded her she had gone too far to recede, and worked on her tenderness once more,—how the weeping Karl, and his lame and lovely bride, lived with us till the old baron thought it fit to give Meeta his blessing and some money,—how Tom Fane wished no good to the pedlar's eyes,—and lastly, how Miss Isabella Slingsby lived and died wondering what earthly motive I could have for my absurd share in these events, are matters of which I spare you and Mr. Colburn the particular. *He* is obliged to me, of course; may I flatter myself that you are *not?*

SLINGSBY.

From Fraser's Magazine.

LOVE'S LEGACY.

BY THE ETTRICK SHEPHERD.

Canto Second.

Now gentlest, purest of thy race,
One other diary deign to trace,
And countenance the fond bequest
Of thy enamoured journalist.
Eventful is the love-sick lay,
And fraught with anguish and dismay;
As every tale of love must be,
If told with due simplicity.
But this is only to supply
Memorial of the times gone by;
For here romance I cannot store,
As all was known to thee before.
I went for four long years and more
To the abodes of ancient lore,
In apathy and blight to drone,
Poring o'er words, words, words alone;
Which I was never more to say
Or hear until my dying day.
There, though induced by nobles gay
To wander in a devious way,
And in some levities to vie
That scarce can bear reflection's eye;
Still to the maid I left behind
I clung with pure unbiassed mind,
And from each rouse and revel came
With new additions to my flame;
While all my visions of delight,
And all my dreams of day and night,
Of babbling brooks and valleys green,
Were only with my rural queen.
She too had left her native grove,
In circles of respect to move;
And then such tales came to mine ear
Of gifted lovers far and near—
Of lords and knights of high degree,
And keen contested rivalry.
But no resource before me lay;
I sat and pined from day to day:
And longed to shed, 'gainst right and law,
The blood of those I never saw.
But let us pine, or bathe in bliss,
Rejoice, or writhe in wretchedness,
Time never lowers a flagging wing
From everlasting journeying.
There's one old adage often said—
And one more apt was never made,
More suiting golden locks and gray—
That "Human life is but a day;"
A day of evil and of sorrow
To those who hope not in the morrow.
And whatsoe'er the evening be,
The morn is verified in me.
I well could such a system frame
Of this old beautcous apothegm,
A diluent so sweet distil,
As would embalm my moral quill;
But dread the exercise too soon,
For terrors of the afternoon.
Its morn, a very trivial braid
Of thorns and roses interlaid—
Of sun and shade a rapid chase,
That daily o'er our mountains race;
Its noon, a fume of fierce turmoiling
Of towering hopes and passions boiling;
But so o'erglossed with gilding bright,
As still to leave a line of light.
But trust me, dearest, and take note—
For this survey is worth a thought—
That all life's roses and its thorns,
Its gleams of light and shadowy bourns,
Have had their wild impetuous source
In youthful love's impassioned force.
Time with his wonted speed flew on,
Till from the halls of hum and drone
I was released, again to fly
Back to my rural deity;
For all the time I'd absent been
I never once her face had seen.
With lightsome step away I strode
To the dear place of her abode,
Repeating boldly all the way
The brilliant things that I would say,
And meant profoundly to proceed
In lauding learning's fountain-head;
And then to raise enraptured eye
With scholar might and majesty,
And own in life's sequestered glade
What more improvement Beauty made.
Yes, I had planned no action less
Than conquest by superb address;
I was to talk with tranquil ease,
And air that might an empress please;
And after sentence terse and brief,
Pull out perfumed handkerchief,
And seem unconscious as the wind
Of all my mighty powers of mind;
While admiration was to sway
The hearts of all that heard the say.
I came—I entered—made my bow;
Saluting all with "How d'ye do?
I hope you're well. How have you been?"
Was all the greeting passed between.
Mine eye was seeking one alone:
She was not there—my speech was gone!
And all my smartness passed to gloom,
Though beauty blazed around the room.
The lightsome form I could not spy,
The pale-rose cheek and falcon eye—
And what cared I for all beside?
My college petulance and pride
Were sent to rest; and for relief,
The odoriferous handkerchief
Came forth with unavailing swing—
The only air, the only thing
That I could muster or evince
Of all my studied excellence.
Oh, wo is me! I was so sped,
So sore-benumbed, so ill-bested—
That I began in courteous chime
Saluting dames a second time;
Not knowing I had strained my lore
In learned compliments before:
The simper and the smile from thence
Were very much at my expense.
Alas! when manhood backward looks
To days of youth, how ill he brooks
The recollection of those scenes
Where reckless folly intervenes.
At length one came, as if to chide,
And set herself down by my side.
"Why are you absent and so glum,
So daunted, doitrified, and dumb?
Are these the airs of learning sage,
Of men the wonders of the age?
Or, must I dread you have in sooth
Forgot the comrades of your youth?"
"Indeed I have not; trust me, ma'am,
I'm glad to see you—faith I am.
I hope I meet you well and gay,
And blithe as when I went away?"
"Yes, so so. But I grieve to see
This want of gallantry in thee,—

This affectation and grimace
To those who looked for other grace,—
Some trace of recollection bland,
And kindlier greeting at thy hand.
I hope 't is affectation's game,
Else something I dare hardly name."
I was dumbfoundered—quite inane,
From shoe-latch to the addled brain;
I ne'er in all my life had seen
A maid of such enchanting mien,
Or form of such a comely grace;
But not one lineament of face,
Or voice, or air, or brow erect,
Could all my efforts recollect;
No, not one feature, were I sworn,
Had I beheld since I was born.
I stared and stammered, blushing blue—
Pulled out my handkerchief anew—
Spoke Latin in my own behalf,—
Then made a vain attempt to laugh.
The lovely group, put to the blush,
Held up their fans, and all was hush;
While she, not knowing what to say,
Arose, and lightly tripped away:
Straight to her gilded harp she paced,
And rang the chords in ruth and haste,
Then raised the melting song on high
Which I had loved in times gone by.
My heart was pierced, and owned the lay
Which only one on earth could play,
So as to steal my soul from me
By music's thrilling melody.
In that sweet strain and song inspired,
So often heard, so oft admired,
I recognised my bosom's queen,
Which my two eyes could ne'er have seen;
My girl was vanished, lost to me,—
But here a perfect prodigy
Of every beauty, every grace,
Addressed me in the elfin's place.
Never was mortal so transfixed,
With wounds of pain and pleasure mixed;
A quaking in my veins began,
A chill through all my vitals ran,—
My head began to swim amain,
My blood seemed rushing to my brain;
Till, tumbling o'er with eldrich moan,
I died with a scholastic groan.
Great was the stir, as gossips said;
For me, I sojourned with the dead,
And carefully was borne away
By comrades trembling with dismay;
While surgeons, parents, sisters—all
Hasted to the funereal hall.
"Poor youth! so lately brisk and boon,—
So fair a flower cut off so soon!"
The surgeon was a man of note,
And said there was no antidote
(Indeed, for death had he devised
One, he might have been canonised)
But recommended ataraxy,
And cupped me for an apoplexy,—
Draining my veins to the last rill
Of purple tide they would distil.
His sapient head could not approve
The thought that I had died of love;
Yet so I had—I died outright,
And slept in death a summer night;
The first, perhaps, from death's domain
Who e'er returned to love again.
Night with its visions passed away,
And life returned at break of day;
But reason tottered on her throne,
Till many days had come and gone;
So deeply love had fixed his dart,
And the keen surgeon played his part.
But still I saw with fancy's eye
A beauteous phantom hovering nigh,
That trod the chamber to and fro
With step as light as snow on snow;
And oft I saw her face so near,
As down she stooped with listening ear,
For fear the youth so erudite
Had slept the sleep of death outright,
So near to mine, that late and rath
I felt her mild and balmy breath.

One time I weened—it might be so—
I cannot vouch to yes or no—
I felt, by chance or by design,
Her glowing cheek depend on mine;
But, true or false as it might be,
The trial proved the same to me.
Again a tremour seized my frame,
And all my veins were wrapped in flame;
The lights went dancing to and fro,
And sore I dreaded I would go;
I cried aloud with stifled breath,
And by the bed-clothes held like death.

Again we sat in bower of bliss,
In perfect love and happiness;
My trembling arm by hers embraced,
Or twined around her slender waist;
Her cheek, as on a former day,
Still touching mine, as if in play;
And her sweet breath, with sob and vow,
Playing around my burning brow;
While her light locks would heave as boon
As amber clouds around the moon;
Then would I wake in feverish pain,
And try to sleep and dream again.

My love-memorial thus far said,
Thy constancy of soul to aid,
And teach thy youthful mind to bear
Stern disappointment's frown severe,
On this my second strain so bland
I set the seal with trembling hand;
And, moved by sob and falling tear,
Inscribe a name to me so dear.
Is it not strange that true love can
Make such a ninny of a man?
Farewell, beloved, I'll write once more
Before I leave the British shore.

Leigh Hunt's *London Journal* has become so established a favourite with the public, having now reached its twenty-third weekly number, that it needs not, though to exonerate our own conscience we must tender, a renewal of the recommendation which we gave to our readers on its first setting out. The commonest topic serves the lively editor for a subject,—a stone, a pinch of snuff, the breakfast-table, the window; upon which he pours forth a stream of thought, recollections, anecdotes, and allusions, in the playful conversational manner of a man of wit and sense, drawn from the stores which a fertile fancy and extensive reading place at his control. He teaches both rich and poor how to extract delight and instruction from the objects around them. To the educated he gives a new relish of their old studies, and to the unlearned he opens up fresh sources of reflection and information.

From the London Athenæum.

Journal d'un Déporté non jugé. 1834. (Printed for private circulation.)

Monsieur de Barbé Marbois, well known as minister, ambassador, and chief judge, as also for a history of Louisiana, of which province he negotiated the sale, wrote an interesting account of his *fructidorisation*, as the French say—in plain English, his transportation, by a *coup d'état* of the executive directory, to the pestilential regions of Cayenne and Sinnamari, in 1797. He wrote while suffering under the cruel sentence, but never thought of printing till now—and which he has done merely for his friends; from one of whom we have obtained the favour of a copy for perusal, with liberty to give such extracts as we think likely to interest the English reader.

Barbé Marbois, a member of the *Conseil des Anciens*, was included with fifteen of his colleagues in a proscription that was in reality directed against the press; since all the respectable editors and proprietors of journals, to the number of forty-two, were on the fatal list, though most of them, from their superior capabilities of getting information in time, were able to escape the blow. The sixteen representatives, too aged (they were nearly all between fifty and sixty years old), and too proud of their political dignity and principles, to allow of flight,* were seized, thrown by sixes into iron cages on wheels, without trial or sentence, and jolted off to Rochefort; the cages and their contents being deposited in dungeons each night.

"My companions (says M. de Barbé Marbois,) had had the consolation of conversing, previous to their departure, with their wives and children: I, eighty leagues distant from my family, remained anxious and ignorant how my poor wife would bear the news of my incarceration. A stranger in France, my Eliza reckoned, on quitting Philadelphia, never to be separated from me. She had passed her childhood in the troubles of the American revolution. A fugitive with her father, proscribed, like other royalists, she had hoped to find tranquillity in France; but there another revolution awaited her. In these circumstances, a husband's presence and support were all in all to her. I thought upon this, borne away as I was irrevocably from her, and this was the bitterest of my reflections. On the morning of my departure for Blois, Cordubar came to bid me ascend to the lodge of the porter: I obeyed—and in a moment my wife was in my arms. Eliza had come upwards of 100 leagues to bid me an eternal adieu. We had but a few minutes to be together. She hastily informed me, that, passing through Paris, she had seen some friends, who had given her hopes that we should not be sent, for the winter at least, farther than Oleron. She spoke of my aged mother—of our child,†—but we had subjects for endless concern, and but a quarter of an hour to satisfy it in. With the consent of Cordubar, and on the condition that Eliza would preserve silence, I conducted her into the damp chapel, where we had slept, and where my companions were only waiting for me to depart. I introduced them to my wife. The apparition of a woman, beautiful, courageous, superior to the weakness of her constitution, moved all who were present. The keepers signified to her to depart. My heart was broken. I embraced her for the last time. In her trouble, she exclaimed—instead of *Adieu*—that she would return. I cried out, in the presence of the magistrates of Blois, "Solicit my trial, but never my pardon." I afterwards learned that, on traversing the court, and seeing our cages drawn up, she fainted away. A captain of *gendarmerie*, perceiving that her domestic was unable to support her, offered her his arm: for this act he was dismissed from his place, by order of the directory."

M. de Marbois has here concealed the full truth—the completion of this scene. His wife, on recovering from her swoon, had lost her reason: nor did she ever recover her senses, being obliged to remain in confinement till her death, which took place a few months since. No sooner had the prisoners arrived at Rochefort, than they were removed from their cages, and hurried on board a wretched vessel, where their fare was worse than the hole in which they were huddled, and their treatment worse than that experienced from the gaolers along the road.

"One of us, not being able to reach the bread, asked one of our guardians, a youth of fifteen or sixteen, to hand it to him; the boy paid no attention at first, and at last flung the bread rudely to him who asked it—it was Pichegru. 'When the sun is down,' observed the general, 'cowards look big in the dark.' 'Mind what you say,' rejoined the boy to the conqueror of Belgium; 'and take care whom you speak to in such a tone.'"

They were a long time on their voyage before they could form a conjecture as to whither they were bound. At length, getting into warmer latitudes, a large box, which had hitherto been kept closely covered upon deck, was opened, and Barthelemy discovered a bread-tree plant. "We are going to Cayenne," said he: "Laraveillere Lepaux has been for months impatient about sending this plant out to Guyana."

There is one characteristic in these volumes that rather mars the impression they would otherwise excite: it is, that a considerable portion of the suffering proceeds from hunger. Hunger certainly is a suffering that one can deeply sympathise with. What so tragic, for example, as Ugolino's? and Pellico's is not less dignified, and scarcely less touching. But whether it is that M. de Marbois has dwelt too much upon it, or treated it in too light a manner, one is as often inclined to smile at, as commiserate, the sad pinchings of stomach experienced by the *déportés*—yet the poor men were almost starved.

"One night a carpenter came, and mysteriously sawed an aperture in the wooden partition of our dungeon. Soon after a leg of mutton and two loaves made their appearance through the aperture. It was some compassionate officers, who thus risked dismissal to send us their supper. Though known to have a good appetite, yet my character for justice was such, that I was entrusted with dividing the prize in the dark. Perhaps the portions were not precisely equal. I kept the shank myself, and certainly there was some meat attached to it. Methought every part of my body was alive to seize its share of the much-wanted aliment. The silence was broken but by mastication. We were concord and happiness itself, when Ramel, the insatiable Ramel, thought fit to ask for his second piece. I was petrified. There was none. "*You* are eating yet," he exclaimed. It was true: I had been carver. But hungry stomachs

* Carnot, however, did escape, whilst Barthelemy, another *director*, scorned even to step aside from the blow.

† The present Duchesse de Plaisance, so remarkable for her love of, and residence in, Greece.

will not hear reason; and all my comrades rose in rebellion against me. Bourdon, the jacobin, made a terrible hubbub. Each thought *he* had been the worst off. I appealed to Barthelemy and Laffor: they were silent; even my friend, of thirty years' standing, would not speak for me. I then appealed to Brotier, the mathematician—equally in vain. All condemned—all bore me rancour; and I suffered more than can be imagined from the injustice—quite as much, perhaps, as I had suffered from that other piece of calumny, equally untrue, of my having been a party to the Treaty of Pilnitz."

They landed at Cayenne in November: their deportation had taken place in September. Collot d'Herbois and Billaud Varennes, two of the infamous and sanguinary jacobins, had undergone the same punishment, and had preceded the present criminals to Cayenne. The inhabitants had as great a horror of the terrorists as they showed themselves kind and feeling towards Marbois and his companions. There were some exceptions: Lavilleheumois, for example, was lodged in the house of a republican zealot, who thus addressed him:—

"Collot was here before you—Collot, who demolished Lyons, and blew its inhabitants before his cannon; but public safety was his excuse. He was the father of the French republic: it was at his suggestion that royalty was abolished. He was rewarded by being banished to this unfeeling spot, where the colonists received and treated him barbarously. Despair caused him a fever; yet he feared to take the medicines they gave him. He called for wine, drank it to excess, and died. Not a stone marks his tomb. You, you —— royalist, are inhabiting his chamber—you sleep in his bed—and, living or dead, *you* will not want friends, whilst he perished without one. Such is the reward of patriotism."

Cayenne, however, was considered too salubrious and comfortable for the exiles: they were despatched from thence to Sinnamari. Here we have the history of the end of another terrorist:—

"After the death of Collot, Billaud Varennes was sent to Sinnamari. He disembarked there on the 27th of October, 1795. Thunder-storms are rare at this time of the year; yet there was a tremendous one at the landing of Billaud. The colonists and Indians saw in the storm the declaration of Heaven pronounced against the great criminal. It was with difficulty that he found a lodging, and that which did receive him was immediately abandoned by every one else. He was soon reduced to utter solitude. He amused himself by teaching a paraquete to speak, and carrying it on his hand in his walks. One day, a bird of prey pounced upon it, and devoured it before his eyes. The death of a pet bird brought tears to the eye that had seen and had ordered so many executions. Yet his demeanour at Sinnamari was reserved, decent, equable, equally free from baseness as from arrogance. I never spoke to him, although he passed four times a day before my cabin."

The ill-fated exiles occupied themselves as they could; those, however, who took to agriculture and hard work, died. M. de Marbois commenced with carpenter's work; he made barrows, desks, a sun-dial; tried his hand even at a clock, but proved not so successful as Louis XVI. He then took to sketching, even portraits, much more to the satisfaction of his black than of his white customers; but even the negroes were not satisfied with a representation of their faces in profile, and pleaded hard to have "the other eye and the other ear put in."

His companions, however, could find no occupation to reconcile them to exile. "Pichegru used to get Aubry, Delarue, and Ramel together in the evenings. He was ever engaged in warlike exercises, drawing his bow, sculling his canoe, and was soon as adroit as an Indian; so that I quickly saw his intention of escaping in the disguise of one." With this view perhaps, in order to become better acquainted with the *Galibis*, as the Indians of those regions are called, and also to accustom the governor to occasional absence, a few of them made a visit to Simapo, an Indian establishment not far off. The work contains a very interesting sketch of their manners and mode of life.

The women sometimes, in the presence of the men, kissed me on the mouth, not without some inconvenience from a mode they have of adorning their chins. They pierce a hole beneath their lower lip, and introduce into it eight or ten pins, which remain with their points outwards, hanging down or protruding like a beard, and offering a formidable barrier to whoever might be bold enough to approach them with gallant intentions.

On the left bank of the Sinnamari, opposite to the village of Simapo, there is the habitation of an Indian who is member of no tribe. Like the savage in Dryden,

> He is as free as nature first made man
> Ere the base laws of servitude began,
> When wild in woods the noble savage ran.

Ouravagare belonged to a distant tribe, which had been dispersed and destroyed by war. He took refuge at Simapo, the chief of which had just died. He offered to replace him; he was refused; and he then asked permission to live in the midst of the new tribe, but not as a member of it, in complete independence. This too was denied; so he established himself alone on the other side of the Sinnamari. His wife and children form a community of seven, over which he rules with absolute power.

But we must hasten onwards. Eight of the *déportés*, with Pichegru at their head, planned an escape. Marbois refused to join in the scheme. He shrunk from the confiscation of his property, which would follow, and which would leave his wife and children unprovided for. On the 3d of June 1798, the eight took advantage of a short absence of the general, and set off at nightfall to gain a bark at some distance from the town. They completely succeeded, and were able in a few days to gain a neighbouring Dutch colony, whence most of them, Pichegru amongst the rest, made their way to England.

Dr. William Carey.—On the 9th of June the death of this eminent oriental scholar is announced at Serampore. He was originally a poor mechanic—a working shoemaker; but devoting himself to the Calvinistic Baptist ministry, he studied the Eastern languages so successfully, that in 1793 he was sent as a missionary to Bengal. There, and at Serampore, his labours have been continued most faithfully during a long period of years; and his translation of the "Ramayana," and other works from the Sanscrit, attest his general learning and great ability; while his labours to spread the Christian faith over Asia have raised a still higher and imperishable monument to his character.

Athenæum.

From the London Quarterly Review.

COOKERY.

1. *On the Ultimate Composition of Alimentary Substances.* By W. Prout, M. D. F. R. S. London, 1827.
2. *Domestic Cookery.* New edition. London, 1834.
3. *Code Gourmand.* Paris. Nouvelle edition, 1833.

When Boswell asked Burke's opinion of his definition of our species—"Man is a cooking animal,"—the great statesman answered—"Your definition is a good one; and I now see the force of the old proverb, 'There is reason in the roasting of eggs.'"

Man is essentially a cooking animal—the only one of God's creatures acquainted with the use of fire, and consequently the only one who is capable of applying it to the purposes of life, with a view to promote his own comfort and happiness. Nor is this invention accidental or of fortuitous origin; on the contrary, the elaborate preparation of his food by means of this element is indispensable and necessary to his well-being.

It would appear that animals who feed exclusively on vegetables are furnished with an extensive apparatus of stomach and other organs, which are admirably adapted to macerate and reduce their refractory food to the purposes of their economy: of this every ruminating animal affords an example. But man, who is evidently intended to live, at least in part, upon vegetable products, has not been furnished with this apparatus; from whence we are authorised to conclude that this deficiency was meant to be supplied by his own ingenuity, as exhibited in the artificial processes of cookery. In this point of view, the culinary art (the improvements of which are too apt to rank among the refined luxuries only of the idle and the rich) is elevated into the dignity of a science intimately connected with the intellectual superiority of human nature; and one is, in some measure at least, released from shame, on being told that of Mrs. Rundell's Cookery Book 153,000 copies have already been sold!

Dietetics, so immediately connected with our present subject, the ancients seem to have more carefully considered than ourselves, and to have made observations thereon which we should be disposed to regard, at the present time, rather as over refinements, than as of any great use or substantial importance. Celsus, for instance, in his classical work, De Re Medicâ, expresses himself upon these matters with a degree of minute and nice discrimination that seems to us unnecessary: thus in cap. xx. p. 78, where he treats of "Quæres alvum movent et adstringunt," he says, among other things, that articles of food which are roasted, eggs, for instance, are astringent: so also are those birds which run, as the crane; on the contrary, birds which swim have an opposite property: that hare and goat belong to the one class of substances; while oysters, in short, all shell fish, appertain to the other. If it be objected that in the beginning of this admirable work, when speaking of the mode of life which a man ought to lead, Celsus maintains that he should live by no determined rule, either of exercise or of repose; be occasionally in the country, occasionally in town; that sometimes he ought to sail, sometimes to hunt, and avoid no sort of food whatever; at one time to abstain entirely from eating, at another to indulge to excess; so that the body may be accustomed to no particular kind of regimen—yet he adds, that this method is calculated for those who are in rude health, for when that has become in the slightest degree impaired, extreme caution is required in the choice of the ordinary articles of food.—(cap. i.)

According to Diodorus Siculus, the early kings of Egypt had their whole diet regulated by the court physician; and here in England, about the middle of the fifteenth century, we are told that—after the fashion of Barataria—

> "Docteure of physique stondeth much in the king's presence at his meles, counselling or answering to the king's grace which diet is best according, and to tell the nature and operation of all the metes; and much he should talke with the steward, chamberlayne, assewar, and the maister cook, to devise by counsayle what metes or drinks is best according with the king."—*Liber Niger Domûs Regis Ed. IV.*

This extract we find in a little work, published some twenty years ago, now almost forgotten, under the title of "Receipts in Modern Cookery, with a Medical Commentary; or, Culina Famulatrix Medicinæ." The book, notwithstanding the quaint and affected style in which it is written, contains many sensible observations; and its very title proves that the author, Dr. Hunter, had some notion of the importance of the art which he undertook to illustrate; though we are disposed to think that a more comprehensive view of the whole subject would have led him to place cookery in a less subordinate situation than that of the mere handmaid of medicine.

It would seem that various food is the most wholesome for man—that he thrives best upon a proper admixture of vegetable and animal diet: the Brahmins, who feed solely upon rice, are not long lived, and are endowed with feeble constitutions; on the other hand, the Esquimaux are obliged to mix saw-dust with their train oil. As to the practice of some tribes in South America, the Ottomacs, for instance, who, when they are deprived of fish, (their ordinary food,) by the inundations of the Oroonoko, swallow, according to Humboldt, balls of a very fine and unctuous clay, of a yellowish gray colour; or that of the quarrymen of Kiffhœuser, who spread a similar clay upon their bread, instead of animal butter,—they must be regarded as analogous to that habit occasionally observed among the West India negroes, and considered as a symptom of dyspepsia, viz. of eating dirt, which is called by physicians Pica. All such practices have for their object the mere distention of the stomach; they can afford no nourishment whatever, but, by allaying the distressing feeling of inanition, appease for a time the cravings of nature: therefore there is *one* circumstance mentioned by Humboldt which we confess appears to us unaccountable, viz. that the Ottomacs "do not become lean during the long Lent of the overflow."

The late Dr. Wollaston made an observation (important as all his observations were) to this effect,—that animals fed exclusively on animal food, secrete more lithic acid, in other words, are more subject to calculous complaints, than those who live on a due mixture of vegetable and animal matter. Another observation has also been made on this subject, which is now fully established by experience, viz. that, as in this class of disorders there is a great disposition to indigestion, indicated by the frequent occurrence of what is called acidity of the stomach, hard water, or that which contains a calcareous impregnation, is the best beverage which such invalids can employ. So far from increasing the disease, the natural hard waters of Buxton, Matlock, Bath, and Bristol, serve to correct it.

Physiologists, it is to be observed, regard no substance as properly nutritive unless it be an organised body, that is, derived either from the animal or vegetable kingdom. Other matters may be useful, either by rendering the substances themselves more digestible, as water, or by exciting the action of the digestive organs, as common salt, which not only does this, but serves other most important purposes in the animal economy.

Dr. Prout has of late clearly proved that all the chief alimentary matters employed by man may be reduced to three classes, viz., saccharine, oily, and albuminous substances, the most perfect specimens of which are respectively, sugar, butter, and white of egg. The saccharine principle, in its extended sense, includes all those substances which are chiefly derived from the vegetable kingdom—means, in fact, the same thing as what we commonly call vegetable diet. It comprehends all those substances, whatever their sensible properties may be, into the composition of which the hydrogen and oxygen enter in the proportion in which they form water;—for example—what perhaps may not a little surprise the reader—the fibre of wood, which chemists call *lignin*. Much skilful manipulation and delicacy of experiment were required to establish this result; but the nutritive property of the woody fibre—in short, that a tolerable good quartern loaf can be made out of a deal board—has been proved by the recent labours of a German professor, and may be verified by any one who will take the trouble to repeat them:—

"The following (says Dr. Prout) was the method he employed for this purpose. In the first place, every thing that was soluble in water was removed by frequent maceration and boiling; the wood was then reduced to a minute state of division, that is to say, not merely into fine fibres, but actual powder; and after being repeatedly subjected to the heat of an oven, was ground in the usual manner of corn. Wood thus prepared, according to the author, acquires the smell and taste of corn-flour. It is, however, never quite white, but always of a yellowish colour. It also agrees with corn-flour in this respect, that it does not ferment without the addition of leaven, and in this case sour leaven or corn-flour is found to answer best. With this it makes a perfectly uniform and spongy bread; and when it is thoroughly baked, and has much crust, it has a much better taste of bread than what in times of scarcity is prepared from the bran and husks of corn. Wood-flour, also, boiled in water, forms a thick, tough, trembling jelly, like that of wheat-starch, and which is very nutritious."—*Philosophical Transactions*, 1827, Part II. p. 318.

To make wood-flour in perfection, according to Professor Autenrieth, the wood, after being thoroughly stripped of its bark, is to be sawed transversely into disks of about an inch in diameter. The saw-dust is to be preserved, and the disks are to be beaten to fibres in a pounding-mill. The fibres and saw-dust, mixed together, are next to be deprived of every thing harsh and bitter which is soluble in water, by boiling them, where fuel is abundant, or by subjecting them for a longer time to the action of cold water, which is easily done by enclosing them in a strong sack, which they only half fill, and beating the sack with a stick, or treading it with the feet in a rivulet. The whole is then to be completely dried, either in the sun or by fire, and repeatedly ground in a flour-mill. The ground wood is next baked into small flat cakes, with water rendered slightly mucilaginous by the addition of some decoction of linseed, mallow stocks and leaves, lime-tree bark, or any other such substance. Professor Autenrieth prefers marshmallow roots, of which one ounce renders eighteen quarts of water sufficiently mucilaginous, and these serve to form four pounds and a half of wood-flour into cakes. These cakes are baked until they are brown on the surface. After this they are broken to pieces, and again ground, until the flour pass through a fine boulting-cloth; and upon the fineness of the flour does its fitness to make bread depend. The flour of a *hard wood*, such as beach, requires the process of baking and grinding to be repeated. Wood flour does not ferment so readily as wheaten-flour; but the professor found fifteen pounds of birch-wood flour, with three pounds of sour wheat-leaven, and two pounds of wheat flour, mixed up with eight measures of new milk, yielded thirty-six pounds of *very good bread*. The learned professor tried the nutritious properties of wood flour, in the first instance, upon a young dog; afterwards he fed two pigs upon it; and then, taking courage from the success of the experiment, he attacked it himself. His family party, he says, ate it in the form of gruels or soup, dumplings, and pancakes, all made with as little of any other ingredients as possible; and found them palatable and quite wholesome. Are we, then, instead of looking upon a human being stretched upon a bare plank as the picture of extreme want and wretchedness, to regard him as reposing in the lap of abundance, and consider, henceforth, the common phrase "bed and board," as compounded of synonymous terms?

The Laplanders of Tryssild, and the mountainous part of Oesterladen, are said by Von Buch in his Travels through Norway and Lapland, in 1806-7-8, to make a bread, called by them Barke Brod, in the following manner.

"When the young and vigorous fir trees are felled, to the great injury of the woods, the tree is stripped of its bark for its whole length; the outer part is carefully peeled from the bark; the deepest interior covering is then shaved off, and nothing remains but the innermost rind, which is extremely soft and white. It is then hung up several days in the air to dry, and afterwards baked in an oven; it is next beat on wooden blocks, and then

pounded as finely as possible in wooden vessels. But all this is not enough; the mass is yet to be carried to the mill, and ground into coarse meal like barley or oats. The meal is mixed up with thrashed oat-ears, or with a few moss-seeds; and a bread of about an inch thickness is formed of this composition."—87.

In another place, the same traveller, talking of the Enare Laplanders, says,—

"In summer they scarcely eat any thing but fish from the fresh-water lakes, and drink with great eagerness the water in which the fish has been boiled. In winter they must put up with dried fish, and with soups of water, fir bark, and rein-deer tallow.—They peel off in summer, the innermost bark of the fir, divide it in long stripes, and hang them in their dwellings to dry for winter stores. When used, these stripes of bark are minced in small pieces along with the rein-deer tallow, and boiled together for several hours with water, till they form thick broth."—p. 324.

It is not improbable, says Dr. Prout, when speaking of this method, that during the above process the lignin combines with water, and forms an artificial starch; what the change may be we will not venture to decide. As for the spongy bread made by the Tubingen Professor, we should like very much to taste it; but with respect to the poor Laplander's coarse and husky variety of *the staff of life*, it can be, we greatly fear, little better than the newly-invented patent bread of our own metropolis.

One word on this new-fangled article. It is well known that in the old established way of baking, the steam which arises during the process is allowed to escape as of no value; but accident discovered, a few years ago, that this vapour, if condensed, exhibited traces of alcohol, and the collection of it immediately became an object of cupidity and speculation; and this, together with some saving of fuel during the process of baking, suggested the patent and the formation of the company upon a great scale.—One of its recommendations was, that bread so made, though kept for any length of time, does not become sour; and this we understand is the fact; but how and at what expense is this incorruptibility procured? Sour bread is unquestionably bad; but is not bread which, if kept too long, is liable to *become* sour, the very article we want? In the new method the distillation (for such it is in reality) is pushed as far as it can go: the whole product of the fermentation is obtained and collected, so that the residue, or loaf, may be regarded as a *caput mortuum*, incapable of undergoing further change; but is it not rather unluckily deprived, at the same time, of its saccharine principle—in short, of all nutritive property?—For our own parts we adhere to the old orthodox "bread with the gin it."

But enough for the present of bread. In France, most substances are exposed, through the medium of oil or butter, to a temperature of at least 600° Fahrenheit, by the operation of frying, or some analogous process. They are then introduced into a macerating vessel with a little water, and kept for several hours at a temperature far below the boiling point (212°) not perhaps higher than 190°; and by these united processes, properly conducted, the most refractory articles, whether of animal or vegetable origin, are reduced more or less to the state of pulp, and admirably adapted for the further action of the stomach.* In the common cookery of this country, on the contrary, articles are usually put once into a large quantity of water, and submitted, without care or attention, to the boiling temperature: the consequence is, that most animal substances, when taken out, are harder and more indigestible than in the natural state; for it is well known that albuminous substances (as, for example, *the white of an egg*) become the harder the longer they are boiled. These observations are often of the utmost importance in a medical point of view. When the powers of the stomach are weak, a hard and crude English diet (such, for example, as half-raw beef-steaks, &c. &c., so frequently recommended) is sure to produce much discomfort by promoting acidity; while the very same articles, well cooked upon French principles, or rather the principles of common sense, can be taken with impunity, and easily assimilated, by the same individual.

It has been remarked before, on the authority of one of our ablest chemical physicians, that our principal alimentary matters may be reduced to three classes, of which sugar, butter, and white of egg, are the representatives. Now, it is a curious circumstance that milk, the only article absolutely prepared and intended by nature as an aliment, is a compound of all the three classes; and almost all the gramineous and herbaceous matters employed as food by the lower animals contain at least two, if not all the three. The same is true of animal aliments, which consist at least of albumen and oil. In short, it is perhaps impossible to name a substance employed by the more perfect animals as food, that does not essentially constitute a natural compound of at least two, if not all three, of these great principles of alimentary matter.

Skin, it may be mentioned, is composed almost entirely of animal jelly, a substance nearly allied in its properties to *albumen*, and called by chemists gelatine, of which the purest example is isinglass.—With the nutritive properties of this we are familiar in a very common culinary pro-

* Singular as it may be thought, it is not yet determined what is the exact purpose of rumination; but looking at the deficiency in the cutting-teeth of such animals as chew the cud, and reflecting upon the fact that this peculiar function is not established till after the young animal has ceased to be nourished by the milk of its mother, we may safely conclude that it is intended in some essential way to assist the process of digestion. An ox, for instance, having filled himself with crude vegetable matter, is seen quietly to lie down, and deliberately to begin to cook his meal, which he has providently taken care to secure before-hand in his large internal storehouse or larder, technically called the paunch, or venter magnus. The stomachs of ruminants *with horns* are somewhat differently constructed from those of animals of the same class, such as the camel, dromedary, and lama, which have a beautiful and curious mechanism, that fit them to live in the sandy deserts where the supplies of water are very precarious. It is said that hares and rabbits ruminate, but it must be only when they eat particular kinds of vegetables; certainly when they are fed upon meal this remarkable action is not perceptible.

duct, viz., blanc-mange. Now, by the process of tanning, skin attracts the tan of the liquor in which it is immersed, and forms a compound insoluble either in cold or boiling water, and not liable to putrefaction. The well known substance, leather, is this compound, and though rather unsavoury and somewhat difficult of digestion, has on an emergency been employed as an article of food. Sir John Franklin, in the account he has given us of his journey to the shores of the Polar Sea, when describing the extremities of hunger and privation of every kind to which he was exposed, says, on one occasion:

"Previous to setting out the whole party ate the remains of their old shoes, and whatever scraps of leather they had, to strengthen their stomachs for the fatigue of the day's journey."—vol. iv. p. 58.

"On another occasion the captain found some of his party halting among some willows, where they had picked up some pieces of skin and a few bones of deer that had been devoured by the wolves last spring. They had rendered the bones friable by burning, and eaten them as well as the skin, and several of them had added their old shoes to the repast."—vol. iv. p. 33.*

Some idea may be formed of the hardships endured by those brave men, from the story of their disappointment and grief when they reached Fort Enterprise, and found all perfectly desolate—no deposit of provisions—no trace of the Indians.

"When I arose," writes Sir John, "on the following morning, my body and limbs were so swollen, that I was unable to walk more than a few yards. My companions, four in number, went to collect bones (the relics of deer that had been thrown away during our former residence) and some *tripe de roche*, which supplied us with two meals. The bones were quite acrid, and the soup excoriated the mouth, if taken alone, but it was somewhat milder when boiled with *tripe de roche*."

A regimen consisting of *tripe de roche* (a lichen of the genus gyrophora), dry bones, and old shoes, is, to be sure, an instance of a mixed animal and vegetable diet, though, it must be granted, not of the most inviting description. But it is in the *artificial* food of man that we see this great principle of mixture most strongly exemplified. Dissatisfied with the productions spontaneously furnished by nature, he culls from every source, and forms, in every possible manner, and under every disguise, the same great alimentary compound. This, after all his baking, roasting, stewing, &c.—how much soever he may be disinclined to believe it, is the sole end an of his exertions. Even in the utmost ref of his luxury the same great principle is to; and his sugar and flour, his eggs and in all their various forms and combinati nothing more nor less than disguised in of the simple elementary prototype, *n* follows, therefore, that to say of any t the old homely way, that "it is as mother's milk," is in fact the highest p can bestow; nor is the preference here *mother's* milk an accidental or indifferent stance—for all chemists know that hum is more nutritious and more digestible t other, inasmuch as it contains very litt but abounds in cream. Here we have instance of the good sense and sound obs couched in our old proverbial expressions

Before we dismiss entirely this summa of human diet, we should observe that, elementary matters employed by man, them, viz: the oleaginous and albuminc animal products, or parts of other anima hence may be supposed capable of being applied to the purposes of the animal e without undergoing any essential change. the saccharine class, derived principally f vegetable kingdom, the case is different; fore this can be converted either into the nous or the albuminous principles, it mus go some essential change or changes in position. But it has been found, that w be the nature of the food of man, the composition of the *chyle*, or milky flu which it is all resolved before its absorpt the system, is all the same.

We all know by our own sensations, ho an influence the stomach exercises over o happiness. Mrs. Hannah More says, quaint way, "There are only two bad th this world—sin and bile." When in a p healthy condition, every thing goes on w is *couleur de rose;* on the contrary, our tell us that the horrors of hypochondri mainly owing to dyspepsia, or indigestion. this is true we have no doubt, though we yet fully disposed to adopt the French m "*mauvais cœur, bon estomac*"—as comp ing the requisites of physical enjoyment.

Our lively neighbours, however, posse indisputable claims to be our masters in of cookery, that every thing coming fro which relates in any way to the table, is to be received with attention and acknov with gratitude. "Les lois règales, appl et exemples de l'art de bien vivre," lai with great exactness in the "Code Gour named at the head of this paper, have affo some amusement; and we think few readers could help smiling at the solemn of the confirmed epicure who has recor results of his gastronomical experience. paying him but a poor compliment, tha worth a hundred Doctor Kitcheners.

The ceremonies to be observed, from t sending out of an invitation to the servic last remove of an entertainment, are de with rigorous formality:—

* But the human stomach can digest harder substances than mere skin and bone, as appears from a paper published in the Medico-Chirurgical Transactions, vol. xii. part 1, 1822, by the late Dr. Marcet. In this memoir he relates the history of an English sailor, who, in imitation of a conjuror whose tricks he had just witnessed, and in a drunken frolic, swallowed several clasp knives, and, ten years afterwards, died in Guy's hospital. Several most skilful surgeons examined his body with great interest and attention: to the astonishment of all, the blades of many knives were found in his interior, 'some of them remarkably corroded and prodigiously reduced in size, while others were comparatively in a state of tolerable preservation.' The knives are still to be seen in the museum attached to the hospital.

CHAP. I. TITRE PREMIER.

"Art. 3.—La date de l'invitation se mesure d'après l'importance du repas. Pour plus de sûreté et de régularité, elle ne peut avoir à courir moins de quatre jours, ni plus de trente.

"Art. 4.—Quand le dîner doit être orné d'une pièce notable, on l'indique par un *post-scriptum*; on écrit, 'Il y aura une carpe du Rhin,' comme il y aura un violon.

"Art. 5.—Le vaste surtout chargé de fleurs est à jamais proscrit de la table d'un vrai gourmand; vaut-il mille écus, il faut lui préférer le modeste hors-d'œuvre dont il envahit la place."

CHAP. II. TITRE SECOND.

"Art. 1.—Un convive qui sait son monde n'entamera jamais une conversation avant la fin du premier service; jusque-là le dîner est une affaire sérieuse dont il serait imprudent de distraire l'assemblée.

"Art. 2.—Toute phrase commencée doit être suspendue à l'arrivée d'une dinde aux truffles.

"Art. 3.—Un convive ne doit être que poli pendant le premier service; il est tenu d'être galant au second; il peut être tendre au dessart. Jusqu'au champagne"——

But the *Convive* is getting too lively for our English notions—so we must turn a new leaf, and introduce the reader to more sober company.

THE RUSSIAN PLATINA MINES.

A report has recently appeared, in the *Berlin State Gazette*, upon the production of platina, and the present state of the mines of that metal in the Russian empire. During ten years, from midsummer 1824 to January 1834, the quantity of platina ore extracted from the mines in the Ural mountains, amounted to 230 quintals, which yielded upwards of two thirds of pure metal. Of this, about 153 quintals were coined, amounting to a sum of 8,186,620 roubles. About 160 pounds were employed in the manufacture of vessels for the separation of gold from silver, and for other purposes. Estimating the amount coined as below one million sterling, and this product of the mines being spread over a period of ten years, it would appear that beyond the cost of the establishments, but little clear revenue has been derived from the mines. But as they are the exclusive property of the crown, and worked by serfs, whose maintenance may be estimated at the minimum of the cost of human support—and moreover, as the quantity of ore has progressively increased with the progress of the mining operations, it is by no means to be supposed that the Ural mines may not add, in a very considerable degree, to the wealth of the Russian empire. Platina being a metal of great unimpressibility, much difficulty was experienced in first converting it into coin—but at length a die of the most ingenious description was constructed for the purpose, by a French mechanist, who is said to have received a very large reward. The coin has hitherto preserved an exact mean between the value of gold and silver, but how its future value may be changed by the increased supply of the ore, and its comparative intrinsic utility for other purposes than money, is yet to be determined. The coin is a handsome one, and specimens, we believe, may be seen at the British Museum.

From the Monthly Review.

A Journey throughout Ireland during the Spring, Summer and Autumn of 1834. By HENRY D. INGLIS. 2 Vols. London: Whittaker & Co. 1834.

The appearance of a new work by a well-known author sets in motion certain anticipations within us, which may be favourable or unfavourable, but which, no doubt, silently operate, to a certain extent, in guiding our judgment of its merits. For we profess not to be beyond the power of such sympathies as may sometimes betray the delicacies rather than the weaknesses of humanity. It is this very sensitive part of our nature that enables us to appreciate nicely the character of a work, where beauties or defects may decidedly, yet unobtrusively, prevail. For example, the moment we saw Ireland in 1834, by Henry D. Inglis, upon our table, a spiritless and faulty volume, which had been previously engaging and provoking us, was laid aside, good nature recovered its wonted sway, and now, said we, a pleasurable duty is before us.

Mr. Inglis is one of our favourites. We do not think that he is oppressed with diffidence of his own talents, neither that he is always careful to withhold a decided opinion where wiser men would halt. But he is eminently well calculated to write such works as the one now to be considered, for he is forward, shrewd, clever, and talkative; above all, he is honest, serious, and instructive. His knowledge is varied, his discrimination of character nice, his liberality exemplary; yet his regard for moral and religious truths unflinching—so that, take him altogether, he is a delightful and valuable writer. His liveliness, activity, and purity, are such, if we may judge from his works, that he must be the most entertaining of companions—a treasure as a fellow-traveller.

Of all that he has published we like the present work most. This may arise from the peculiar interest naturally excited by the field of his labour; imparting, both to the writer and the reader, a sort of patriotic zeal—a familiar partiality. What Briton is there who feels not for Ireland as for a dear sister, whose trials in life have been singularly severe and protracted, whose cup of affliction and anguish still continues to run over? The author is deeply imbued with the sentiments of affection and commiseration. Fain would he do good for poor Ireland. Nor will his ardent desire fail; for, of all the accounts given of that unhappy country, which have come to our knowledge, this is by far the most honest. The author not merely is honest, but he has been at the utmost pains to arrive at the truth; and what greater good can any one man confer on Ireland than to let England know the truth concerning her? From the very first step which Mr. Inglis takes in the country, the reader feels that nothing is told but what has the irresistible force of fidelity stamped upon it. His own assertion might have been sufficient in testimony of his honesty; but a man may be blind to his strongest partialities. Here, however, we see no tendency but that uniform one, of carefully and anxiously searching for facts.

It is a field eminently worthy of a philanthropic

and an enlightened mind, which the author undertook to traverse and describe. England's ignorance of Ireland is, in the work before us, proved to be most gross. This is owing to the unhappy spirit of party, which so broadly and deeply envelopes the truth, colouring and falsifying every partisan's testimony; and to the difficulty which an unbiassed enquirer thence encounters, when in search of data to go by, of arriving at the real facts. The author was accordingly every where told, that in case of attempting to glean opinions on all hands, their contrariety would bewilder him. An eminent and talented judge in Dublin said, that he could easily imagine two well educated persons, and both equally free from prejudice, returning from a journey through Ireland, with views and impressions directly opposed to each other, according as the letters of introduction, which they carried, chanced to be to men of one party or to men of another.

As the author well expresses himself, this shoal, upon which he fears many who have written upon Ireland have made shipwreck of truth, he endeavoured to avoid, by obtaining letters to men of all parties, ranks, and religions; trusting to be able to correct, by minute personal observation, diversities of opinions, which resolution, it is evident, he faithfully and industriously followed out. He carried from Dublin upwards of 130 letters of introduction to persons, from the peer to the farmer, (to the peasant he introduced himself,) and of all opinions; these letters again were most prolific, begetting, in the course of the tour, at least three times the above number. From the first letters, and other circumstances, a general impression was conveyed that he meant to tell the truth, without having any party to serve, and this encouraged men of all opinions to put him in the way of finding it. So that the author was singularly well equipped for his journey, whether we consider the aids he received, or his own faithful eagerness in research.

The very first paragraph of the work contains observations worthy of the reader's attention and confidence. The author says it might be an impertinence were he to begin by any general assertion of the ignorance of the British public respecting Ireland; but that there can be no impertinence in acknowledging his own; that during his tour he found more to correct in his previous impressions and opinions than in any journey he ever made through any country; that were he to exclude from this acknowledgment the social condition of the inhabitants, and apply it but to what is visible to the eye, the declaration would hold true. How profound then must have been, as he adds, his ignorance of all beneath the surface! We wish we could transfer into our pages the entire spirit and information contained in these neat volumes; there would be no lack of entertainment for our readers; for who can faithfully describe Irish character and scenery and not be entertaining? But we have a higher object in view than any that is not of paramount magnitude; and therefore proceed to do our best, considering our limits, to make Ireland in 1834 be seen and known.

The author arrived in Dublin in spring, and was much struck by the splendour, architectural and otherwise, of the city. Many apparent proofs of wealth are thrust upon the eye, in certain parts of the metropolis, but a closer observation brings to the mind the proverb, "that it is not all gold that glitters." He remarks, that if caution be necessary in drawing conclusions respecting the wealth of Dublin, from what meets the eye in certain streets, tenfold caution is required in drawing any conclusions respecting the condition of Ireland, from even the *real* state of Dublin. That Dublin prosperity is somewhat deceptive, he shows, by stating, for example, that a tradesman there sets up his car and his country-house, with a capital that a London tradesman would look upon but as a beginning for industry to work upon. We have often heard of the affecting contrasts presented in that city between grandeur and poverty; and we are told by the author, that the pauper population resembled strongly that of the Spanish towns, supposing the potato to be converted into a melon. In London, every fifth and sixth shop contains bacon and cheese, in the meaner parts of the city; but a corresponding department of Dublin presents a very different scene; for what would be the use of a bacon shop, where the lower orders cannot afford to eat bacon? Of the author's mode of gathering facts and making up his opinions, the following is a striking example.

"As I have mentioned the lower orders in Dublin, I may add, that the house in which I lived in Kildare-street, being exactly opposite to the Royal Dublin Society, which was then exhibiting a cattle-show, I was very favourably situated for observing, among the crowd collected, some of those little traits which throw light upon character and condition. I remarked, in particular, the great eagerness of every one to get a little employment, and earn a penny or two. I observed another less equivocal proof of low condition. After the cattle had been fed, the half-eaten turnips became the perquisite of the crowd of ragged boys and girls without. Many and fierce were the scrambles for these precious relics; and a half-gnawed turnip, when once secured, was guarded with the most vigilant jealousy, and was lent for a mouthful to another longing tatterdemalion, as much apparently as an act of extraordinary favour, as if the root had been a pine-apple. Yet these mouthfuls were freely given; and I have seen, that where two boys contended who should take charge of a gentleman's horse, the boy who obtained the preference, and got the penny or twopence, divided it with his rival. These were pleasing traits; and were indicative of that generosity of character which displays itself in so many kindly shapes; but which is, perhaps, also in some degree the parent of that improvidence, to which the evils of absenteeism are partly to be ascribed."—Vol. i. pp. 12, 13.

Upon these facts he detects a national trait—improvidence, allied with a love of ostentation, which has greatly swelled the lists of absentees. Among our own friends from the Emerald isle, some of whom adorn and enrich London, we think that a tendency to the trait, detected by the author, may be discovered; at least when they are contrasted with the calculating Caledonian, the feature is prominent. Mr. Inglis has counted twenty-seven hackney coaches and sixteen cars, in the funeral procession of a person in the humblest walks of life, with other circumstances of

needless display. He bears hearty testimony to the fascination of Dublin society, to the hospitality that characterises the inhabitants, and to the beauty of the city. But as it was his object rather to search for deeper and wider grounds as respects the real condition of the country, it will be ours to fix upon those parts of the work that seem most distinctly to elucidate this design. Before leaving Dublin, however, we must quote part of what is said concerning the Mendicity Society, which we, with him, trust is not to be a permanent one; though, whilst there is no legal provision for even the aged and infirm, something of the kind is no doubt praiseworthy.

"When I visited the Dublin Mendicity Society, there were 2,145 persons on the charity, of whom 200 were protestants. The finances were then at a very low ebb; and the directors of the institution were threatening a procession of the mendicants through the streets, by way of warming the charity of the spectators. This, I understood, has once or twice been resorted to; and I confess, I cannot conceive any thing more disgraceful to a civilised community. The English reader, who has never visited Ireland, can have no conception of a spectacle such as this. What a contrast to the gaiety of Grafton-street, would be the filth, and rags, and absolute nakedness, which I saw concentrated in the court of the institution! The support of this charity is a heavy tax upon the benevolent feelings of the protestant population: 50*l.* is subscribed by the protestant, for 1*l.* that is subscribed by the catholic population. I was sorry to learn this; for although it be true that wealth lies chiefly amongst the protestants, yet it is the middle classes, rather than the wealthy, who support this institution; and 50*l.* for 1*l.* is surely out of proportion."—Vol. i. pp. 16, 17.

He saw some of these poor people at work for a few pence per week; but hundreds, for whom no employment could be found, were lying and sitting in the court, waiting for the mess which had tempted them from their hovels.

After leaving Dublin, the author proceeds towards Wicklow, where he expected, from what had been told him in the metropolis, that the labourers were all employed and tolerably comfortable.

"I am only beginning my journey: this is but the county of Wicklow; and I was told that I should find all so comfortable in Wicklow, that from the comparatively happy condition of the peasantry there, I must be cautious in forming my opinion of the peasantry generally. While I write this sentence, I write in utter ignorance of what I may yet see: for I write this work almost in the manner of a diary—noting down my observations from week to week: but from what I have already seen, I am entitled to fling back with indignation the assertion, that all the Irish industrious poor may find employment. But what employment? employment which affords one stone of dry potatoes a day for a woman and her four children.

"A labourer in this country considers himself fortunate in having daily employment at sixpence throughout the year; and many are not so fortunate. I found some who received only five-pence; but there are many who cannot obtain constant employment, and these have occasional labour at ten-pence or one shilling; but this only for a few weeks at a time. I found the small farmers living very little more comfortable than the labourers. A little buttermilk added to the potatoes, made the chief difference."—Vol. i. pp. 32, 33.

Many of the cabins he visited boasted a pig, which sometimes dwelt with the family, where, as Paddy says, "he has the best right to be, since it's he that pays the rent." High rent is the universal complaint, and this is fully borne out by the manner in which the people, both Catholic and Protestant, were found living. When asked why they take land at a rate which they cannot pay, the reply is, "How were they to live? what could they do?" So that Mr. Inglis declares, competition for land in Ireland is but the out-biddings of desperate circumstances.

We know not what others may argue from the following expressions of the author's opinion regarding a catholic institution in Waterford. We, who are not of that communion, may be too partial to the views of one of our own creed, and prepossessed when we think he is singularly impartial in his statements on such delicate ground as is uniformly introduced by religious opinions. It is fair, however, that the reader may have a specimen of what is here set down on a point where no doubt there is much difference of sentiment.

"There are in Waterford several large public institutions; particularly, an house of industry, which appear to be under good management, though the want of a separate place for lunatics is very objectionable; and a mendicity society, the same in principle as that in Dublin, but exhibiting rather less filth and wretchedness. But the most important institution which I visited, was a catholic school, at which upwards of seven hundred children were instructed. This is a new establishment, called by some, monk-houses; and is an association of young men, who dedicate their lives to the instruction of youth, and who call themselves 'Brothers of the Christian Schools.' It is, in fact, a monastic institution, bound by vows, like other orders: and although I am far from questioning the motives either of the founder, Mr. Rice, or of the young men who thus make a sacrifice of themselves; yet I cannot regard favourably an institution under such tuition. I know too much of Catholicism, in other countries, to doubt that intellectual education will be made very secondary to theological instruction; and although I am very far from ascribing all, or any large portion of the evils of Ireland to the prevalence of the Roman Catholic faith, yet I would rather not see a system of education extensively pursued, in which the inculcation of popish tenets form the chief feature. These schools are established in many other towns besides Waterford; and where I meet with them, I shall not fail to notice them. There are at present ninety members of the order of 'Brothers of the Christian schools;' and their number is rapidly increasing."

We are informed that whisky-drinking prevails to a dreadful extent in Waterford; that out of 30,000 inhabitants, 25,000 are catholics; that the blind policy of Irish landlords is in many instances hostile to the establishment of manufactories, although such must tend to keep up their rents. Near the village of Mayfield, Mr. Malcomson has established a cotton manufactory, which proves a blessing of the most signal kind to the neighbourhood. No fewer than 900 persons are employed in it, whose lodging, food, and morals have been wonderfully improved. Yet—

"I regretted deeply to learn, not from the proprietor of the mill only, but from other sources, that Lord Waterford's family have thrown every obstacle in the way

of this establishment; and that, only the other day, an attempt has been made to take advantage of some manorial rights, and to demolish the mill dams. Pity it is, that the aristocracy should, even by open acts, separate themselves from the interests of the people around them. The enterprising quaker who has established this factory, has done more for the neighbourhood, than Lord Waterford and all the Beresfords have ever done; and his lordship's pride ought to be, less in his magnificent domain, and fine stud, than in the comfortable condition of the surrounding peasantry, and in the establishment which has produced it."—Vol. i. p. 70.

We know not what a change of ministry may bring about; but the defeat of the Waterford family in the election for the county has operated wholesomely for some time. The author says that they felt it severely, and that more attention has since been paid to the interests of the tenantry.

In Kilkenny the author found the most widespread and most aggravated misery. Out of a population of about 25,000, he was enabled to know that upwards of 2,000 were totally without employment.

"It chanced that I was at Kilkenny just after the debate on the repeal question; in which the prosperity of Ireland was illustrated by reference to that of Kilkenny, of whose prosperous manufactures honourable mention was made, condescending even upon the number of water wheels at work, which were said to be eleven in number; and the carpet manufactory, too, was spoken of in such terms, that it was said to be owing to its success that the weavers of Kidderminster had petitioned for repeal. I visited these prosperous factories, immediately after the account I have mentioned was received: the principal of these factories used to support two hundred men with their families: it was at eleven o'clock, a fair working hour, that I visited these mills, and how many men did I find at work? ONE MAN! And how many of the eleven wheels did I find going?—ONE; and that one, not for the purpose of driving machinery, but to prevent it from rotting."—Vol. i. pp. 91, 92.

We find the number of disheartening pictures so great that we cannot afford many more in this part of the author's journey. What sort of landlord should we think him to be, who is enriched as here described, were he found to act so in England?

"I had heard, even in England, of the wretched condition of a town in the county of Kilkenny, called Callen; and finding that this town was but eight miles from Kilkenny, I devoted a day to Callen. I never traveled through a more pleasing and smiling country, than that which lies between Kilkenny and Callen; and I never entered a town reflecting so much disgrace upon the owner of it, as this. In so execrable a condition are the streets of this town, that the mail coach, in passing through it, is allowed twelve minutes extra; an indulgence which can surprise no one who drives, or rather attempts to drive, through the street; for no one who has the use of his limbs, would consent to be driven. And yet, will it be credited, that a toll is levied on the entrance into the town of every article of consumption; and that not one shilling of the money so received is laid out for the benefit of the town. The potatoes, coal, butter-milk, with which the poor wretches who inhabit this place supply their necessities, are subject to a toll, which used to produce 250*l.* per annum; but which having been resisted by some spirited and prying person, who questioned the right of toll, the receipts have been since considerably diminished. It was with some difficulty that I obtained a sight of the table of tolls; but I insisted on my right to see it, and satisfied myself that potatoes and butter-milk, the food of the poor, pay a toll to Lord Clifton, who, out of the revenue of about 20,000*l.* per annum, which he draws from this neighbourhood, lays out not one farthing for the benefit of his people."—Vol. i. pp. 97, 98.

The following passage may in some respects be taken as a companion to the former extract; whilst pointing towards another curse of Ireland besides that of hard-hearted landlords, it goes to establish the author's impartiality.

"Cashel is rather a pretty town: the principal street is wide and well built; but the place is far from being in a flourishing condition. It was formerly a place of much resort, and consequent prosperity; but it is now almost entirely an absentee town; and I found every thing extremely dull, and things getting daily worse. Wages were here only eight-pence a day without diet, and numbers were altogether without employment. The population of Cashel is, at present, about 7,000; and the number of protestant communicants about 150. I was sorry to hear bad accounts of the protestant archbishop. I found him universally disliked, even by those dependent upon him, and of the same religious persuasion. He does no good; and, by all accounts, is a close hard man, in every sense far overpaid by the 10 or 12,000*l.* a year which he enjoys. He has the disadvantage, indeed, of being compared with his predecessor, whom all, protestant and catholic, unite in praising."—Vol. i. pp. 110, 111.

Here is another important statement.

"I heard but one opinion as to the necessity of a Coercion bill. Almost every outrage and murder that has disgraced Ireland, has arisen out of one of two causes—either competition for land, or tithes; and, until means be found for reducing the former, and till the latter be finally and justly settled, it will be in the power of a restless, wrongheaded, or interested man to agitate Ireland. Competition for land can only be diminished by employing the people; but I greatly fear that no scrutiny, however strict and impartial, into the revenues of the protestant church, and that even no application of the surplus, will be satisfactory to the land occupiers of Ireland. Here, as every where else, in the south, I heard the strongest objections to tithe in any shape; and a curious instance came to my knowledge, of the determination of farmers to get rid of tithe. A farmer agreed to pay 30*s.* an acre for a certain quantity of land, the landlord being bound to pay tithe and all other dues. On rent day the tenant arrives, and, before paying his rent, asks what tithe the landlord pays? 'Why do you wish to know that?' says the landlord; "what is it to you what tithe I pay? you pay me 30*s.*, and I take tithe and every burden off your hand.' 'I know that,' says the farmer; but I'll not only not pay tithe myself, but your honour sha'n't pay it either.' The tenant offered the landlord his rent, deducting whatever tithe he, the landlord, paid: and the rent is, at this moment, unpaid."—Vol. i. pp. 116—118.

The absentee landlords are not all bad; neither can we properly call him an absentee whose principal property lays out of Ireland. Of this honourable number, it is with pleasure we find Mr. Stanley figuring, whose estates in Tipperary the author declares are well managed; the rents are moderate, the tenantry well treated, and a library has been formed for their benefit. We hope that the following piece of tyranny witnessed at Cahir is not of frequent occurrence.

"I am sorry to be obliged, in this place, to record a

fact, to which I could not have given credit on any evidence less conclusive than that of my own eyes. The Roman Catholic chapel is newly erected, and is yet unfinished: and I was told, that the anxiety to obtain funds for its completion gave rise to the enaction of some curious scenes at the door. I went there about ten o'clock; and I certainly did witness a scene of a most singular kind. The gates were shut, and four men stood by. One had a silver salver to receive the larger contributions: two were provided with wooden ladles, for the copper offerings; and these they shook in the ears of every one who approached: and one man, the priest, stood, just within the gate, armed with a shillelah. *No one was admitted who did not contribute!* I saw a man attempt to pass without contributing; and I saw the priest push and buffet the man, and, at length, strike him several times with his stick, and knock his hat off his his head! This is no matter of hearsay. I saw it; and I saw from thirty to forty persons kneeling outside of the gate, on the high road—poor persons, who had not a halfpenny to spare. To be more and more sure, that this was the cause of their remaining without, I gave some halfpence amongst them, and saw them admitted." —Vol. i. pp. 125, 126.

Before laying aside the first volume, which our limits advertise us immediately to do, (for we cannot do more than put our finger on some of the landmark evils and characteristics of Ireland as noted by Mr. Inglis), we must let our readers see what is said of the mighty *Dan*.

"I was now in O'Connell's country: here was the property of Daniel O'Connell, Esq.;-or the liberator, as the people called him; there, the property of Charles O'Connell, Esq.; and there again, the property of another O'Connell: but the greater part of the O'Connell property —almost all that of *the* O'Connell, is held under head landlords; and he is only an extensive middle-man. Near to Cahir-siveen, is the birth-place of the great agitator. It is a ruined house, situated in a hollow near to the road; and when I reached the spot, the driver of the car pulled up, and enquired whether I would like to visit the house. But the driver of my car was not a native of these parts; for be it known to the reader, that O'Connell is less popular in his own country than he is elsewhere. If you ask an innkeeper, or an innkeeper's wife, any where in O'Connell's district, what sort of a man their landlord is? 'Och, and sure he's the best of landlords—he takes the childer by the hand, and he wouldn't be over proud to dthrink tay with the landlady.' But if you step into a cabin, the holder of which owns Daniel O'Connell, Esq., as his landlord, and if you ask the same question, he'll scratch his head, and say little any way. Shortly before I visited Cahir-siveen, there was a road-presentation in that neighbourhood, and the rate payers, who have now a vote in these matters, refused at first to pass it, unless the O'Connells would pay two-thirds of the expense: because, said they, 'the O'Connells have lived long enough out of road presentations!'"—Vol. i. pp. 235—237.

It would be wrong to pass over three passages at the close of the volume; Longford is the county spoken of.

"From time to time, considerable emigration has taken place from this part of Ireland to America; and it is not unusual for remittances to be sent home from the colonies, by those who have emigrated, for the use of their poor relatives. Now it is a curious fact, and a fact that consists with my knowledge, that catholic emigrants send their remittances to the care, not of the catholic priest, but of the protestant clergyman, to be distributed by him among those pointed out. The same respect for, and reliance on, the protestant clergyman, is evinced in other ways. It is not at all unusual for catholics possessed of a little money, to leave the protestant clergyman their executor, in preference to their own priest, or to any other individual."—Vol. i. p. 347.

Mr. Inglis considers it to be most important to the civilisation of Ireland, that a better order of catholic priesthood should be raised. At present he says they are reared at Maynooth in monkish bigotry. But he does not spare the establishment when occasion calls.

"I found in one party of this county, great want of accommodation for the protestant congregation. I allude to the parish "of the Union of Kilglass." There is monstrous abuse here. The bishop is rector, and draws from four to five hundred pounds per annum; and yet there is no church, or protestant service in the parish. His lordship, on being respectfully written to on the subject, replied, that there was service in the next parish!" —Vol. i. p. 349.

How can crime be repressed so long as such a state of things exists, as is thus described?

"Trading magistrates are not yet extinct in the county Longford: value is still occasionally received for magisterial protection, in the shape of labour—such as, a winter-cutting of turf being brought to a man's door. Neither is there much co-operation among the magistracy. They take pleasure in thwarting each other; and it is not unusual for persons imprisoned by the warrant of one magistrate, to be forthwith liberated by the warrant of another."—Vol. i. pp. 349, 350.

As the author, near the beginning of the second volume, approaches Galway, he takes occasion to mention, that in Ireland men of moderate views, between the extremes of high catholic and high conservative, are on the increase; not men of an imbecile policy, but who reprobate all preferences of any party. This opinion suggests to us, what indeed is enforced by every thing contained in these volumes, that it is not any one single evil that can be named which frets and poisons Ireland, but the whole frame is in disorder; which the legislature cannot cure by any fiat it may put forth. Could the whole body of the people be convinced that their regeneration must chiefly depend on themselves, on their own earnest exertions to do away with the factions among them, health would recover part of its sway, coercive measures would be slackened, private morals would gain a firm footing, and respect for the laws make the country a safe habitation for the great proprietors. But this home-wrought regeneration is not likely to be of sudden operation, and we fear a distant day must be looked to for Ireland's prosperity.

On leaving Galway, the author for a while leaves the more civilised part of Ireland behind him, to travel through Cunnemara and Joyce's country, without any such incumbrances as might impede a pedestrian's journey. In these wild regions he was present where a *pattern* was held, high up amongst the mountains. It was originally a religious ceremony, but it is chiefly now resorted to for recreation, which generally ends in drunkenness and fighting.

"Every body in this part of the country is called Joyce; and the spot where the pattern is held, is claimed

by the Joyces, to be in Joyce's country: but this is not admitted by the Cunnemara boys: and accordingly, two factions—the Joyces and their opponents—usually hold patterns near the same ground, though not close together; but yet so near as to make it impossible that the meetings should break up without a *scrimmage*. The Joyces are a magnificent race of men: the biggest, and stoutest, and tallest I have seen in Ireland, eclipsing even the peasantry of the Tyrol; and I believe, indeed, their claims on this head are universally admitted. I shall, by and by, have an opportunity of introducing the reader to *Big Jack Joyce*, when I visit him in his own house." —Vol. ii. pp. 48, 49.

The author was warmly welcomed by many. There might be a score of tents, and hundreds of persons were seated on the grass or stones, while some of the older people were on their knees, beside the holy well. By and by, symptoms of a quarrel arose, and our author stepped aside, that he might witness a regular faction fight.

"Any one, to see an Irish fight for the first time would conclude that a score or two must inevitably be put *hors-de-combat*. The very flourish of a regular shillelah, and the shout that accompanies it, seem to be the immediate precursors of a fractured skull; but the affair, though bad enough, is not so fatal as it appears to be: the shillelahs, no doubt, do sometimes descend upon a head, which is forthwith a broken head; but they oftener descend upon each other; and the fight soon becomes one of personal strength. The parties close and grapple; and the most powerful man throws his adversary: fair play is but little attended to: two or three often attack a single man; nor is there a cessation of blows, even when a man is on the ground. On the present occasion five or six were disabled, but there was no homicide; and after a *scrimmage*, which lasted perhaps ten minutes, the Joyces remained masters of the field. The women took no part in the fight, but they are not always so backward: it is chiefly, however, when stones are the weapons, that women take a part, by supplying the combatants with missiles. When the fight ended, there were not many remaining, excepting those who were still in the tents, and who chanced to be of neither faction. Most of the women had left the place when the quarrel began, and some of the men too. I noticed, after the fight, that some who had been opposed to each other shook hands and kissed, and appeared as good friends as before."—Vol. ii. pp. 51, 52.

It would appear that in this hill country the small land owners are in much more comfortable circumstances than those of the flat and the fertile districts. "Neither here nor in any part of Ireland," says the author, "need a stranger be afraid to travel." Potheen is very generally distilled illicitly throughout Ireland, and among the mountains there are plenty of places where the *still* is a point of concentration for gossip and drinking, and no reckoning to pay, as almost every landholder there distils for himself. It is easy to see what influence such an abundance of poison to the morals must have over old and young; so that this evil must carry with it the most disastrous effects in a national point of view. Indeed, every chapter of the work before us presents more that is to be blamed than praised; and whilst so many evils unite, will Ireland be wretched.

We must commend the author not only for telling truths, but for telling them in the way he does; not even avoiding to give the landlords by name, whom he praises or blames; for this may produce good, as he says. General statements carry little weight with them; and why should he confound the good with the bad?

"The chief proprietors of the town of Sligo are Lord Palmerston and Mr. Wynn. The land in the barony, especially Mr. Wynn's, is let extremely high. Mr. Wynn's tenants are, with very few exceptions, in arrear; but he is one of those short-sighted landlords, who is resolved at all costs to keep up the nominal amount of his rent-roll. His rents are taken in dribbles—in shillings and copper; and agents have been known to accompany tenants to market with their produce, lest any part of its value should escape the landlord's pocket. This gentleman has been at great pains to establish a protestant tenantry on his estate; and in the appearance of their houses, &c., there is some neatness, and some show of comfort; but these are not in reality in any better condition than the other tenantry. None of them are able to do more than barely to subsist; and they, as well as the catholic tenantry, are generally in arrear; indeed, I found no one exception. The whole land in this barony averages 2*l*. 5*s*. per acre. In the county, it is supposed, that excluding bog and mountain land, it averages 26*s*.; and good cultivated land may average 2*l*. There is no living, and paying such rents.

"Lord Palmerston's property is an honourable exception. On an estate between Sligo and Ballyshannon, his lordship expends more in improvements—in roads, drains, piers, corn stores, &c. than the amount of the whole revenue of the estate. In every way improvements, and an improving tenantry are encouraged; and the people on that estate are in a comparatively comfortable condition. This is one of the few instances I found in which the tenantry on an estate were allowed to benefit by the advantages and improvements of the district."—Vol. ii. pp. 125, 126.

Mr. Inglis was impressed repeatedly in his progress through Ireland with another disheartening appearance. Amongst the country people, the affection between man and wife, he considered to be unequal to what adorns domestic life in the humbler spheres in Britain. We were hardly prepared for this statement, and trust that it has been rashly made. The Irish probably exhibit their attachment in different ways to what the author is familiar with; for certainly they have been called a people of ardent, it may be hasty and unstable, affection. Still, Mr. Inglis has had ample opportunities for seeing a good deal of their homely manners; and if he be in the right, there is here to be found not a little which goes to colour the condition of the people of Ireland. His theory as to some of the most effectual means of benefiting that disordered country, may in a great measure be gathered from the following sentences.

"I am not one of those who ascribe *all* the evils of Ireland to popery; but I am one of those who think protestantism the better religion for the people, and the safer for the state; and think also, that it ought to have been, and ought still to be, the study of government to encourage the growth of protestantism by every wise and legitimate means; nor can I let slip this opportunity of observing, from all I have seen and learned in Ireland, that one of the most certain means of increasing protestantism in Ireland will be such measures of reform in the Irish church as will encourage and reward the working clergy, at the expense of those who do not or who will not work; as will sweep away pluralities, and forbid non-residence; as will place protestant education on a better footing; and

as will provide for the final and effectual settlement of the tithe question."—Vol. ii. pp. 164, 155.

After one long extract, we must close Mr. Inglis' work. It respects a comparison of the northern or protestant counties of Ireland, with the southern or catholic counties, in reference to their appearances and conditions. He admits that generally there is a marked difference in the appearance of the protestant districts over the others, but denies that this is owing *in any great degree* to the people being protestants. Listen to his reasoning.

"I say in any great degree, because I admit that the protestant religion being more favourable to the diffusion of knowledge and to intellectual cultivation than the Roman Catholic faith, it will, in some degree, affect favourably the condition of a people. But, I repeat, that protestantism is not the chief cause of the differences to which I have alluded. 'Look,' says a favourite writer, 'at a church, and a mass congregation, and you will be at no loss to distinguish the one from the other.' Truly no. They are very easily distinguished. But, let me ask, who, throughout every part of Ireland (excepting Ulster), are the individuals composing the church congregation? Are they not the gentry and some few of the more substantial farmers? It is not, therefore, at all difficult to distinguish between the catholic and protestant population: for this is but distinguishing between the upper and the lower ranks. But to come more directly to the assertion that a protestant district has quite another aspect from a catholic district, which I admit to be a fact, I think it no difficult matter to find reasons for this, more influential in their results than the profession of protestantism.

"Did it never occur to those who have observed a fact, and instantly seized upon the *least* influential of all its causes, as its *sole* origin, that the rate of wages might make some difference in the condition and aspect of a people? The catholic peasantry of Clare, Kerry, Galway, Mayo, and of indeed all the south, west, and much of the centre, have not employment at all during half of the year—or, in other words, one half of them have no constant employment; and when they are employed, what is their rate of wages? Eight-pence, and even six-pence, without diet. The protestant population of Derry, Antrim, Armagh, and Down, have, if not full employment, at least greatly more constant employment than their catholic brethren of the south; and the rate of wages is from 10*d.* to 1*s.* 4*d.*; the difference is, at the least, 4*d.*; and does 4*d.* per day make no difference in the condition of an Irish labourer? But the most overwhelming argument for those who would ascribe all the difference in condition to protestantism is, that not the protestants only, *but the catholics also* in these protestant counties, are in a better condition. How should this be? The mass of the lower classes in the towns, as well as the great majority of the country labourers in the districts called protestant, are catholics; but they are not in the condition of their catholic countrymen of Munster and Connaught. We do not see them with tattered coats and bare feet; and why? Because they are generally in employment, and receive higher wages. I have seen in catholic districts, catholic tenantry, and catholic labourers, comfortable where they had the good fortune to be placed in favourable circumstances—as on the estates of Mr. Tighe of Woodstock, Mr. Power of Kilfane, Lord Arden, Mr. Stanley, Lord Palmerston, Lord Lansdowne, &c.; and I have seen protestants as miserable as any catholics could be—as on the estate of Lord Donoughmore and others."—Vol. ii. pp. 213—216.

He goes on at a length which we must not quote; but another source, according to his views of the superior comfort throughout the north, is the growth and manufacture of flax. And the next cause advanced is, that they are of Scotish descent. Now, we are most unwilling to distrust the author's liberal conclusions; but still, we think the admissions which he has made respecting the habits and descent of the people in the north of Ireland, might, without much difficulty, be so turned against him, that his opinions would require more substantial props. From these extracts, however, our readers may judge of his performance; and surely they must say with us, that it is singularly impartial, and calculated to be useful; it narrates facts, not fictions, truth alone being the author's object. May that truth be the subject of study in England!—still more may it be listened to and understood in Ireland!

From the Court Magazine.

DEAR DOWAGER DUCHESS.

BY T. HAYNES BAYLEY, ESQ.

Dear Dowager Duchess, though treble my age,
There's a pain in my heart you alone can assuage;
And, poor as I am, when your jointure I see,
Your grace appears one of the graces to me!

For misses not out of their teens I have sighed,
But a pauper must not wed a pennyless bride;
And prudence has whisper'd, "Mind what you're about,
Say '*your grace*' before dinner, or else *go without!*"

Your lip is no ruby, no diamond your eye,
But diamonds and rubies in plenty we'll buy;
No pearls are your teeth, yet in pearls you shall shine,
And I'll call you my mother of pearl when you're mine.

No rose is your cheek, no lily your neck,
Yet your wig with the lily and rose we will deck;
An attachment like mine well deserves a reward,
Though there's "Captain half pay *unattached*" on my card!

That tell-tale, the peerage, *your* age may betray,
Yet, if people blame you, ne'er heed what they say;
For when your young husband is seen with his bride,
At least they must own you have *youth on your side!*

Some will say it is strange that a youth should be struck
By a belle so mature; oh! they envy my luck;
For *my* choice ten thousand good reasons appear,
Ten thousand! nay more—I 've ten thousand a year!

One of the enormities of protestantism, which shocks the papists, is the marrying of our clergy. What is to be said of the Roman Catholic Bishop England, who, going on a foreign mission, takes out with him *four nuns!*

The English bishop takes one wife,
The papist says, "O fie!"
The Roman Catholic takes out four,
And no man asks him, why?

Having shown this sprightly contribution to our Roman Catholic sub-editor, he begs leave to offer an explanation of the seeming inconsistency:—

To vindicate the papist's life,
See how the thing is done;
The protestant alone takes *wife*,
The catholic takes *nun*.

From the Quarterly Review.

Travels into Bokhara; being the Account of a Journey from India to Caboul, Tartary, and Persia: also Narrative of a Voyage on the Indus, from the Sea to Lahore, &c., in the years 1831, 32, *and* 33. By Lieut. Alexander Burnes, F. R. S. 3 vols. 8vo. London, 1834.*

We are not in the number of those who affect to think or to speak slightingly of the East India Company; still less are we disposed to admire those conceited persons who are in the habit of sneering at the directors of that company, contemptuously designated as "a set of *merchant-kings*, exercising their sway, and issuing their commands, with an equal ignorance of the first principles of government and of trade!" As to principles of trade, we must indeed confess that they have shown themselves averse from the new fangled doctrine of *free trade;* but is that question quite settled yet? With respect to the charge of unfitness to be trusted with the government of so vast an empire as India, it appears no bad answer that they and their servants conquered and created this empire; and the history of its rise and progress may perhaps be admitted as some further proof of their fitness to wear what they have won. Upon their trade, the house of commons, in its wisdom, has thought fit to put an extinguisher—*merchants* they no longer are. That last and most important branch of their trade, alike productive of profit to those who carried it on, and to the public exchequer—the tea-trade of China—has followed the fate of the rest, never to be recovered by themselves or by others. Not all the energies of all the free traders of the United Kingdom will ever replace it on the old and advantageous footing.†

It is to be hoped, however, that no further encroachments will be made on the authorities who have so long and so ably administered the government of India, and whose successful endeavours, in diffusing happiness among countless millions of a quiet and innocent people, are universally allowed. Placed as these natives are, under the immediate rule of able, upright, and honourable men, taught from an early age to respect their prejudices, and to treat them with kindness and humanity—no change of the present system, we are quite satisfied, could tend to better their condition, or to promote the tranquillity of this extensive empire: this *they* well know and are ready to admit; and we are persuaded that such repose and security, in the midst of a conquered people, is *mainly* owing to the dispersion of well-educated youths among the natives, whose language they learn, whose habits and customs they make themselves acquainted with, and whose opinions they treat with respect. Many of these adventurers, thus thrown into high and responsible situations at an early period of life, frequently without any one to advise with, and therefore compelled to reflect, and to act on their own discretion, need not shrink from a comparison, either as regards ability or conduct, with any functionaries in Europe, whether military or diplomatic.

We need not travel out of the pages of the volumes which are now before us in search of an instance of what we are contending for. For the conduct of the first mission here recorded, Mr. Burnes was originally recommended by Sir John Malcolm, himself a brilliant example of the advantage to be derived from an early application to the study of the language, manners, and opinions of the native races. That admirable judge did not hesitate to say, in writing to the governor-general, "I shall be very confident of any plan Lieutenant Burnes undertakes in this quarter of India: provided a latitude is given him to act as circumstances may dictate, I dare pledge myself that the public interests will be promoted." It might have been natural enough that some senior officers should have felt a little jealousy in being passed over on such an occasion; but, with a good-natured jocularity, they were ready to admit the superior claims of Lieut. Burnes, though he was "one of Sir John Malcolm's swans." Lord William Bentinck was so much pleased with his conduct of what had been entrusted to his charge, that on his return he took this "swan" under his protection, and employed him on a second journey of far greater importance, though avowedly of a private nature.

In attempting to give some account of the three volumes before us, we labour under considerable

* In the short notice of this work in the last number of the Museum, no attempt was made to analyse the travels. The present review will be found both entertaining and valuable.—*Ed. Mus.*

† The evil consequences which we predicted in an article on "The Free Trade to China" (*Quarterly Review*, No. C.) have already began to show themselves. The most respectable of the Hong merchants have retired from business, and the rest are either unable or unwilling to advance a shilling to enable the poor cultivators of tea to prepare the usual supply, though 40,000 tons of shipping were expected at Canton; but we shall, notwithstanding, have *some* tea, and it is as well that our readers should know what *sort* of tea it will be. Our information is from an eye-witness of unquestionable authority, recently arrived in England from China. On the opposite side of the river to, and at a short distance from, Canton, is a manufactory for converting the very worst kind of coarse black tea into green; it is well known in Canton by the name of *We-ping*, and was always rejected by the agents of the East India Company. The plan is to stir it about on iron plates moderately heated, mixing it up with a composition of turmeric, indigo, and *white lead*, by which process it acquires that blooming blue of plums, and that crispy appearance, which are supposed to indicate the fine green teas. Our informant says, there can be no mistake respecting the white lead, as the Chinese superintendent called it by its common name *yuen-fun*. At the same time it is right to state, that pulverized gypsum (known by the name of *shet-kao*) is understood, by the gentlemen of the late factory, to be employed to subdue a too intense blue colour given by the indigo. There were already prepared, when this visit took place, 50,000 chests of this precious article, just enough for three cargoes of the very largest ships of the East India Company. The crafty proprietors told our friend and the other visiters that this tea was not for the English but the American market; but we shall no doubt have our full share of it: nay, some particulars lately published in the newspapers render it highly probable that the importation of the well-doctored *We-ping* has already commenced.

difficulty: where there is such an exuberance of varied matter, *that* alone renders the task of selection no easy one; nor would any moderate space suffice to convey to our readers an adequate idea of what they may expect from a perusal of the work itself—one of the most valuable, we do not scruple to say, that has yet appeared, for the variety of information it contains regarding Sinde, the Punjab, and the upper regions of central Asia. On all these countries, it may be consulted as a standard work. Our difficulty is increased by the mechanical arrangement of the materials, in which we miss something of that *lucidus ordo* which a more practised writer would have preserved. For instance we have first a *personal narrative;* then follow various *memoirs* on the countries travelled through, which embody the same thoughts and observations, frequently in the same language, with a repetition of description, both as to persons and things, which had already appeared in the personal narrative; this is particularly remarkable in describing the Punjab and the Indus. We rather suspect, indeed, that the memoirs were originally not intended for publication, and that they embraced political discussions which it has been thought proper to suppress. Another point which creates a little awkwardness to the reader is the inverting the chronological order of the travels performed: these commenced with the author's voyage up the Indus and its ramifications; whereas his book begins with the Journey into Bokhara, the second in point of time. The reason assigned is, 'that its interest is, perhaps, greater than that of the Voyage;" we are by no means sure of that: both are sufficiently interesting, and there are many reasons why the narrative should have proceeded in the order of time, as we intend our notice of it shall do.

In the year 1830, a ship arrived at Bombay with a present of five large spotted gray horses, from the King of Great Britain to Maharaja Runjeet Sing, the sovereign of the Seik nation, at Lahore, accompanied with a letter from the president of the board of control; and the governor general added an old coach suited to these huge animals. Mr. Burnes, then holding a political situation in Cutch, which borders on the Indus, was appointed to convey these horses up that river to their ultimate destination. A fleet of five native boats received him and them, together with Ensign Leckie, a surveyor, a native doctor, and their servants. They first proceeded from Mandivee, in Cutch, to Koree, the eastern and largest of the eleven branches of the Delta of the Indus, from whence, in four or five days, they crossed the mouths of the whole of them, entering and examining, as well as they could, the said branches of this great river; and on the seventh day from their departure from Cutch, they cast anchor in the western or most distant mouth of the Indus, called Pittie. Here Mr. Burnes had the gratification of observing the rocky range of black mountains, bearing the modern name of Halu, but pretty well ascertained to be the *Irus* of Nearchus. "I here read," he says, "from Arrian and Quintus Curtius, the passages of this memorable scene in Alexander's expedition—the mouth from which his admiral Nearchus took his departure from Sinde." We may observe that Mr. Burnes appears to have had these two historians of Alexander's expedition constantly at hand, to enable him to compare the names of places and descriptions contained therein on the spot; and after so doing, his opinion is, that numerous places on the Indus and its large tributary streams, their names even, and their descriptions, as given by these authors, were satisfactorily identified in his progress up the Punjab. We can conceive few sources of higher gratification than such a comparison, made by an enterprising officer who had not forgotten the classical studies of his earlier days.

After they had proceeded about thirty-five miles up this branch of the river, a body of armed men crowded round the flotilla, stating themselves to be soldiers of the Ameer of Hydrabad, sent to examine the packages in the boats; and they were determined to do their duty, for they took good care that every box and package, even that which contained the old coach, should be wrenched open. The reis, or captain, said it was necessary the strangers should not remain, but await the decision of the Ameer at the mouth of the river. Indeed, both here and in their way down, they met with such torrents of abuse from the people, that Mr Burnes determined not to wait, but to return to the eastern branch of the Indus, from whence he addressed the authorities of Sinde, and also our resident in Cutch. The answer of the Ameer was couched in friendly terms, but contained a formidable enumeration of physical obstacles to his proceeding up the river. In short, after experiencing every species of deceit and dissimulation, not to be exceeded even by the Chinese; after returning a third time to the Indus; and after having spent two months in fruitless attempts, Mr. Burnes determined to set off by land, and at the end of a week's negotiation at Tatta, succeeded in effecting his purpose, but not before another month was wasted, when at last, on the 12th of April they embarked in the flat-bottomed boats or *doondees*, of Sinde.

"Our fleet consisted of six of these flat-bottomed vessels, and a small English-built pinnace, which we had brought from Cutch. The boats of the Indus are not unlike China junks, very capacious but most unwieldy. They are floating houses; and with ourselves we transported the boatmen, their wives and families, kids and fowls. When there is no wind, they are pulled up against the stream, by ropes attached to the mast-head, at the rate of a mile and a half an hour; but with a breeze they set a large square sail, and advance double the distance."—Vol. iii. p. 36.

The Wanyanee, up which they proceeded, is one of the principal branches—a fine river of five hundred yards in width, and twenty-four feet in depth, the banks covered with tamarisk, among which were the reed huts of a few fishermen, the only inhabitants to be seen. But even among them it would seem the character of our countrymen is not unknown; for a *Syud*, or holy man, standing on the water's edge, turning to his companion, exclaimed, "Alas! Sinde is now gone, since the English have seen the river, which is the road to its conquest." The navigation up to

Tatta is difficult and dangerous; the banks are so undermined that they often fall in masses that would crush a small vessel.

Off Hydrabad they received deputations from the Ameer, to congratulate them on their arrival in his territory. An audience was immediately granted, and the Ameer was studiously polite; he excused their long detention from his ignorance of political concerns—he being a soldier, and employed in commanding *the three hundred thousand Belooches*, over whom God had appointed him to rule! This was imposing enough, but there was nothing else in the durbar, or palace, that could give countenance to such a boast: "they met in a dirty hall without a carpet; they sat in a room which was filled by a rabble of greasy soldiery, and the noise and dust were hardly to be endured." The general appearance of the capital corresponds with the court. Its population does not amount to twenty thousand, and these chiefly inhabit huts of mud.

The next town of any consequence is Sehwan, a place of great antiquity, containing about ten thousand inhabitants. A ruined castle overlooks the town: it is perhaps the most singular building on the Indus, and, Mr. Burnes says, "is, in all probability, as old as the age of the Greeks." It is an oval mound of earth, surrounded from the base to the summit by a brick wall, containing an enclosure about 1200 feet long by 750 broad. It is said to resemble the tower at Babylon, as described by Mr. Rich. Here they found the climate oppressive; the thermometer not lower than 100° at midnight.

At Khyrpoor the Ameer was exceedingly civil and attentive. He begged their acceptance of the poor hospitality of a Belooche soldier; and "the hospitality which he so modestly named, consisted of eight or ten sheep, with all sorts of provisions for one hundred and fifty people daily, twice a day a meal of seventy-two dishes, besides various presents of valuable daggers, swords, cloths, native silks, and a purse of one thousand rupees, the last of which was declined." As they proceeded up the Indus, the country became more populous, and the curiosity of the people on the banks was intense: that of the ladies more so than of the other sex; the female descendants of Mahomed are veiled, or rather have a long white robe thrown over their entire body; they are all beggars, and very vociferous in their demand for alms. One of the few amusements of the inhabitants is stated to be that of listening to the lascivious songs of the courtesans, who are to be met with in every town and village of this country; they are described as a remarkably handsome race.

At Mittun the party quitted the Indus, which here receives, through the channel of the Chenaub, the united waters of the Punjab rivers—those five great streams whose names the historians of Alexander's exploits have handed down to us. Taking them in succession from the westward, or nearest the Indus, these names are—the Hydaspes (now Julum)—the Acesines (Chenaub)—the Hydraotes (Ravee)—the Hyphasis (Garra), the upper part of which is the Hesudrus (Sutlege). At Mittun, therefore, our voyagers took a last farewell of the Indus, which here exceeded two thousand yards in width, and entered the Acesines of the Greeks, down which Alexander sailed to the great trunk or main branch of the Indus.

The small territory of Bhawul Khan, called Daoodpootra, lies next to Sinde. Ooch is the principal town, the population of which is reckoned at twenty thousand; it is a mean place. The khan sent a messenger with the present of a deer, which he had himself shot, forty vessels of sherbet, and as many of sweetmeats; also a bag of two hundred rupees, to be distributed by Mr. Burnes in charity, to mark the joyful event of his arrival. Soon after he paid them a visit.

"He was attended by about a thousand persons; and I observed that he distributed money as he passed along. After the visit, our mihmandar brought us presents from the khan; they consisted of two horses richly caparisoned with silver and enamel trappings, a hawk, with shawls and trays of the fabrics made at Bhawulpoor, some of which were very rich; to these were added a purse of two thousand rupees, and a sum of two hundred for the servants; and, last of all, a beautiful matchlock, which had its value doubled by the manner in which it was presented. 'The khan,' said the messenger, 'has killed many a deer with this gun; and he begs you will accept it from him, and, when you use it, remember that Bhawul Khan is your friend.'"—Vol. iii. p. 97.

Ooch is near the junction of the Garra with the Chenaub; the route lay up the latter, and Mr. Burnes now entered the territories of the Seiks, to whose chief, the Maharaja Runjeet Sing, he was proceeding on his mission. A camp had been pitched on the frontier to wait his arrival. The Sirdar held in one hand a bow, to be presented according to the custom of the Seiks, and in the other two Persian letters in silken bags. One of these contained the substance of the maharajah's commands to his officers, regarding the mission, which bore ample testimony to the splendid munificence and hospitality of this distinguished chief. It commenced by ordering that two hundred infantry and lancers should be held in readiness, as an honorary escort on Mr. Burnes reaching the frontier—that an elephant, with a silver houda, should be despatched for his express use,—that the sirdar, and another officer, seated on two other elephants, should meet him, to congratulate him on his safe arrival—that they should conduct him to the appointed halting-place, and set before him one thousand one hundred rupees, and fifty jars of sweetmeats—the same to be repeated at Shoojuabad, and at Mooltan to be doubled—and, lastly, that one hundred camels be laden with provisions, and the like number of rupees be distributed as before, while on their march to Lahore.

Mooltan which is described by Mr. Elphinstone as four and a half miles in circumference, and surrounded with a fine wall from forty to fifty feet high, is the only place of importance, on or near the Chenaub, as far as the point of junction of this river with the Hydraotes or Ravee, along the latter of which the mission had now to proceed to Lahore, this ancient capital of the Mogul empire being situated on its banks. Mooltan is said to contain sixty thousand inhabitants, mostly

Hindoos and Mahomedans. It is famous for its silk manufactures, which are greatly encouraged by Runjeet Sing. Mr. Burnes thinks there is little doubt of Mooltan being the capital of the Malli of Alexander. There is every indication at least of its being one of the most ancient cities in India. The silk *kais* of Mooltan and the *loangees* of Bhawulpoor assist, in Mr. Burnes's opinion, "in fixing the country of the Malli, for Quintus Curtius informs us that the ambassadors of the Malli and Oxydracæ (Mooltan and Ooch) wore garments of cotton, lawn, or muslin *lineæ vestes*), interwoven with gold, and adorned with purple;" he thinks we may safely translate *lineæ vestes* into the stuffs of Mooltan and Bhawulpoor, which are interwoven with gold, and most frequently of a purple colour.

As the point where the Hydaspes unites with the Acesines was only forty-five miles out of their route to the westward, and believing that the former of these streams, so famous in ancient history, had never been visited by a European since the days of the Greeks, Mr. Burnes, much to the surprise of his Seik friends, who could not comprehend the motives of his curiosity, set out on a galloping expedition to its banks. It was here that the fleet of Alexander encountered such disasters in the rapids; and it was here, also, that the hordes of Timour were terrified by the noise of the waters. Mr. Burnes says the Hydaspes joins the Acesines with a murmuring noise, but that the velocity of the current is inconsiderable, and vessels now pass it without danger, except a very little in July and August. But the superstitious reliance of the boatmen on the protection of a saint, whose tomb stands at the fork of the two rivers, would seem to bespeak considerable danger at some seasons. While on this trip, Mr. Burnes was fortunate enough to find a Bactrian coin, resembling that of an Apollodorus which it was afterwards ascertained to be, and this is the first Grecian relic that has been found in the Punjab.

Deputations met the mission at every stage of their voyage, bearing congratulations and presents of a variety of kinds, including provisions, fruits, and sweetmeats. Butchers were sent from Mooltan to supply their wants; loads of saltpetre to cool their wine and water; and the necessaries and luxuries of life were supplied without bounds. At length, on the 17th of July, the lofty minarets of the king's mosque at Lahore made their appearance; but the ceremonial of their *entrée* required they should halt three or four miles from the capital. Here Captain Wade, the political agent at Lodiana, and Dr. Murray, with the principal men of the state, escorted by a guard of cavalry and a regiment of infantry, met the mission. On the way they were joined by M. Allard, a French officer who commands the maharaja's cavalry, and M. Court, an intelligent gentleman of the same nation, also in his service. Entering Lahore by the palace gate, the streets were lined with cavalry, artillery, and infantry, with an immense concourse of people. Passing through the first court of the palace, and conducted by a soldier-like person in armour to the door, Mr. Burnes says, "while stooping to remove my shoes at the threshold, I suddenly found myself in the arms and tight embrace of a diminutive old-looking man—the great Maharaja Runjeet Sing." After the usual questions and complimentary enquiries, the letter from his majesty's minister was produced, which the maharaja, rising up, received, and touched his forehead with the seal. It was then handed to his minister, who read aloud the Persian translation of it. The contents gave the maharaja such evident satisfaction, that before it was half read, he said he would greet its arrival by a salute, "and a peal of artillery from sixty guns, each firing twenty-one times, announced to the citizens of Lahore the joy of their king." Thus it seems the Seiks beat us hollow in their salutes—1260 guns on the reading of a letter from Lord Ellenborough!

This affair being finished, Runjeet Sing expressed his intention of viewing the presents; he was delighted with the horses, and he too called them little elephants. He talked a great deal for about an hour and a half; enquired as to the depth of water in the Indus, the practicability of navigating it, the kind of people who occupy its banks, and their political and military importance. About thirty horses of his own stud were then brought out, caparisoned in the richest and most superb manner, and some of them adorned with very valuable jewels. The maharaja was evidently perfect master of his stud; he named each horse, and described his pedigree and points; but Mr. Burnes does not appear to think very highly of them.

"The exertion which his highness underwent seemed to exhaust him, and we withdrew. Nature has, indeed, been sparing in her gifts to this personage, and there must be a mighty contrast between his mind and body. He has lost an eye, is pitted by the small-pox, and his stature does not certainly exceed five feet three inches. He is entirely free from pomp and show, yet the studied respect of his court is remarkable; not an individual spoke without a sign, though the throng was more like a bazaar than the court of the first native prince in these times.

"The hall of audience, in which the interview took place, was built entirely of marble, and is the work of the Moghul emperors; part of the roof was gorgeously decorated by a pavilion of silken cloth studded with jewels. The maharaja himself wore a necklace, armlets, and bracelets of emeralds, some of which were very large. His sword was mounted with the most precious stones. The nobles were likewise dressed for the occasion with jewels; and all the court appeared in yellow, the favourite colour of the nation, which has a gaudy but striking effect."—pp. 154, 155.

"The most creditable trait in Runjeet's character is his humanity; he has never been known to punish a criminal with death since his accession to power; he does not hesitate to mutilate a malefactor, but usually banishes him to the hills. Cunning and conciliation have been the two great weapons of his diplomacy. It is too probable that the career of this chief is nearly at an end; his chest is contracted, his back is bent, his limbs are withered, and it is not likely that he can long bear up against a nightly dose of spirits more ardent than the strongest brandy."—p. 167.

After such a description of the physical *status* of the great maharaja, we cannot feel much surprise at the difficulty he experiences to keep in

order the class of subjects mentioned in the following paragraph.

"On the evening of the 25th, his highness gave us a private audience, in which we saw him to great advantage—for he directed his court to withdraw. On our arrival we found him seated on a chair, with a party of thirty or forty dancing girls, dressed uniformly in boys' clothes. They were mostly natives of Cashmere or the adjacent mountains, on whom grace and beauty had not been sparingly bestowed. Their figures and features were small, and their Don Giovanni costume of flowing silk most becoming, improved as it was by a small bow and quiver in the hand of each. The 'eyes of Cashmere' are celebrated in the poetry of the East, of which these Dianas now furnished brilliant specimens, in gems black and bright; disfigured, however, by a kind of sparkling gold-dust glued round each organ. 'This,' said Runjeet Sing, 'is one of my regiments (pultuns), but they tell me it is one I cannot discipline;' a remark which amused us, and mightily pleased the fair. He pointed out two of the ladies, whom he called the 'commandants' of this arm of his service, to whom he had given villages, and an allowance of five and ten rupees a day. He shortly afterwards called for four or five elephants to take these, his *undisciplined* troops, home.'—pp. 161, 162.

Mr. Burnes remained at the maharaja's court from the 18th June to the 16th August, when he had his audience of leave.

"In compliance with a wish that I had expressed, he produced the 'Koh-i-noor,' or mountain of light, one of the largest diamonds in the world, which he had extorted from Shah Shooja, the ex-king of Cabool. Nothing can be imagined more superb than this stone; it is of the finest water, and about half the size of an egg. Its weight amounts to three and a half rupees, and if such a jewel is to be valued, I am informed it is worth three and a half millions of money—but this is a gross exaggeration. The 'Koh-i-nour' is set as an armlet, with a diamond on each side about the size of a sparrow's egg.

"Runjeet seemed anxious to display his jewels before we left him; and with the diamond was brought a large ruby, weighing fourteen rupees. It had the names of several kings engraven on it, among which were those of Aurungzebe and Ahmed Shah. There was also a topaz of great size, weighing eleven rupees, and as large as half a billiard ball: Runjeet had purchased it for twenty thousand rupees."—Vol. iii. p. 168.

The Koh-i-noor here mentioned has passed through many hands, and we should not be surprised if this "mountain of light" should, one of these days, be seen to shine forth, as the Pigot diamond did for some time, in the magazine of Rundell and Bridge on Ludgate Hill. When Tavernier* was in India, it belonged to the Great Mogul Aurungzebe. Nadir Shah, we believe, carried it off from Delhi, and from him it fell into the hands of Timour Shah, and descended to his sons at Cabool. It suffered many perilous escapes when in possession of the unfortunate Shooja-ool-Moolk, from whom it was procured, not in the most honourable way, by Runjeet Sing.

The ceremony of leave-taking being ended, Runjeet Sing delivered a letter addressed to his majesty's minister for the affairs of India, in reply to the one carried by Mr. Burnes. It is a great curiosity of its kind. It commences thus: "At a happy moment, when the balmy zephyrs of spring were blowing from the garden of friendship, and wafting to my senses the grateful perfume of its flowers, your excellency's epistle, every letter of which is a new-blown rose on the branch of regard, and every word a blooming fruit on the tree of esteem, was delivered to me by Mr. Burnes and Mr. John Leckie," &c. He then recurs to the delivery of the said letter by "that nightingale of the garden of eloquence, that bird of the winged words [who expected to meet with the ιπτα πτεροεντα in the Punjab?] of sweet discourse, Mr. Burnes!"—with a great deal more of the like flourish.

The city of Lahore had been abandoned to a state of decay; the adjoining fields were covered with the ruins of mosques and tombs, and the modern city is confined to the western angle of the ancient one: the streets are narrow and offensively dirty. The king's mosque of red sandstone, with its four lofty minarets, is still standing; but the temple itself is converted into a powder magazine. The tomb of Jehungeer still remains a monument of great beauty. It is built of marble and red sandstone in alternate layers: the name of Jehungeer is inscribed as "The Conqueror of the World." The garden of Shah Jehan—the Shalimar, or "house of joy"—is another magnificent remnant of Mogul grandeur, about half a mile in length, with three successive terraces one above the other. A canal intersects this beautiful garden, and throws up its water in 450 fountains, to cool the atmosphere.

The soft and effeminate manners of the East appear, however, to have fewer charms for Runjeet Sing than military display, wine, and outward splendour. He says he owes all his conquests to the bravery of the troops of his own nation, who are free from prejudice; would carry eight days' provision on their backs; dig a well if water were scarce, and build a fort if circumstances required it, which the Hindoostanees would never do. "I pay my officers and troops," he said, "with the shawls and productions of Cashmere; and as I give a chief who may be entitled to a balance of 300 rupees, shawls to the value of 500, he is well pleased, and the state is benefited."

He told Burnes that the wine he sent him was mixed with pearls and precious gems; and this, it seems, is a common beverage in the East; so that the best is in the bottom, and probably falls to the share of the butler. He is himself immoderately fond of wine and strong liquors. At parting he produced a splendid bow and quiver, and also a horse richly caparisoned, with a shawl cloth thrown over his body, a necklace of agate, and heron's plume stuck on his head, saying, "This is one of my riding horses, which I beg you will accept." A similar present was given to Mr. Leckie; and while they were viewing the animals, one of the great dray-horses was brought forward, dressed out in cloth of gold, and bearing an elephant's houda on its back. Runjeet then sprinkled sandal-oil and rose water over them with his own hands, which completed the ceremony.

* A print of this diamond is given in Tavernier's Travels, from which its shape appears to be that of the thicker end of an egg cut in two. Mr. Elphinstone writes it *Cohenoor*.

Having taken leave of Maharaja Runjeet Sing, Mr. Burnes directed his steps towards Simla, on the Himalaya mountains, to give an account of his mission to Lord William Bentinck, who had taken up his residence there, on the score of health. On the second day, he reached Umritsir, the holy city of the Seiks, a distance of thirty miles; the intervening country highly cultivated. The *Nuhr* canal, cut from the Ravee at Lahore, passes by Umritsir, and continues for eighty miles, and is navigable by small boats. At twenty-three miles from Umritsir, the party crossed the Hyphasis, at Julalabad. Swollen to a mile in width, its current exceeded five miles an hour, so that, after two hours spent in crossing, they landed about two miles below the point from which they started. A little beyond this they halted at the estate of the Seik chief Futtih Sing, who was present with Lord Lake's army in 1805. Their reception was cordial; and the following sketch may convey some idea of the mode of life of a Seik Sirdar.

"Immediately we were seated, he produced his bottle, drank freely himself, and pressed it much upon us; it was too potent for an Englishman, but he assured us that, whatever quantity we drank, it would never occasion thirst. We filled a bumper to the health of the sirdar and his family, and were about to withdraw, when he produced most expensive presents, which could not in any way be refused; he gave me a string of pearls, and some other jewels, with a sword, a horse, and several shawls. Futtih Sing is an uncouth looking person, but he has the manners of a soldier. His income amounts to about four lacs of rupees annually, and he lives up to it, having a strong passion for house-building. Besides a board of works in two of his gardens, he was now constructing a house in the English style, but has sensibly added a suite of rooms underground for the hot season. When we left Futtih Sing, he urgently requested that we would deliver his sincere sentiments of regard to his old friend, Sir John Malcolm."—Vol. iii. p. 180.

Proceeding from hence, and passing the towns of Jullinder and Jumsheer, they came to the town of Fulour, on the banks of the Sutlege, the frontier post of the Lahore chief. The munificence of the Naharaja continued to the last; and the party, at the time of crossing the Sutlege, had received, in hard cash, no less than 24,000 rupees. This river, the Hesudris of antiquity, is yet called the Shittoodur, or the Hundred Rivers, by the natives. It was observed, that the waters of the Sutlege were colder than any other of the Punjab rivers; no doubt, from the length of its course among the Snowy Mountains. From the Sutlege, the party proceeded to Lodiana, where they rested a few days among their countrymen; and from hence prosecuted their journey to Simla, distant about one hundred miles, where Mr. Burnes was received in the most flattering manner by the governor-general of India; who states, in a public document addressed to himself, that "the whole of his conduct has his entire and unqualified approbation." We are told, indeed, that his lordship entered at once into negotiations for laying open the navigation of the Indus to the commerce of Britain; which, whether regarded in a commercial or political point of view, must be considered as a measure of enlightened policy.

The Indus, it appears, is a river of greater magnitude than has usually been ascribed to it. The water it discharges, after receiving the five great tributary streams, is stated to be, in the month of April, the dry season, 80,000 cubic feet in a second of time; while, in the same month, Mr. Prinsep found the Ganges to discharge only 21,500 cubic feet: the former, therefore, is nearly four times the amount of the latter; and not far short of that discharged by the Mississippi. The reasons assigned by Mr. Burnes, in his "Memoir of the Indus," for this difference in favour of the Indus, would appear well-founded. The main trunk and the large tributaries of the Indus all take their rise among snowy mountains, furnishing a constant supply of water in the dry season; most of them flow through countries thinly peopled and poorly cultivated, in comparison with those traversed by the Ganges; the waters of the latter are therefore profusely expended in irrigation, blessing the inhabitants of its banks with rich and exuberant crops; while those of the former are, for the most part, suffered to run to waste. Other causes are stated, which account for the superiority of the Indus. It is, undoubtedly, a noble river, and navigable by a fleet from Attock to the sea.

The voyage to Lahore occupied just sixty days of navigation, sometimes with sails, at others with men tracking the boats, proceeding generally from sunrise to sunset. The route they took presents one uninterrupted navigation of a thousand miles from the sea to this capital of the Seiks. The return voyage has never been tried, as no trade exists between the Punjab and Sinde by water, the jealous rulers of the latter preventing it; but Mr. Burnes estimates it may be done in fifteen days—thus, Mooltan, six; Bukkur, four; Hydrabad, three; and to the sea, two.

The present territories of Runjeet Sing extend from the Sutlege to the Indus, and from Cashmere to Mooltan, comprising the whole of the countries watered by the Punjab. Mr. Burnes says, that so entirely has the Seik nation altered its constitution under this chief, that from a pure republic it has passed to an absolute monarchy. Though the genius of one man has effected this change, it can hardly be expected to be permanent. The son of Nadir Shah, when about to unite himself with a princess of the house of Delhi, was called upon to give an account of his male ancestors for seven generations: "Tell them," said this haughty adventurer, "that he is the son of the sword, and the grandson of the sword, and so on till they have a descent of *seventy* instead of *seven* generations!" The following words of Mr. Burnes may, therefore, turn out to be prophetic:

"The power which Runjeet Sing acquired has been preserved by his policy: he has a disciplined army of infantry, with a due proportion of cavalry and artillery. The system is unpopular in the country, and the Seik sirdars view with distrust the innovation and the innovators. The French officers, when deprived of their patron, would find it necessary to stand aloof, from motives of personal safety; and, if they left the country, the wreck of their labours would soon perish in the general tumult."—Vol. iii. p. 296.

Mr. Burnes, being the first European of modern

times who had navigated the Indus, was stimulated by a desire to extend his travels beyond that river, a design which received the most liberal encouragement from the governor-general of India. Being joined by Mr. James Gerard, of the Bengal army, on the 2d of January, 1832, he left Lodiana, having previously solicited Runjeet Sing to permit his again entering and passing through his territories. On the frontier they were met by a sirdar or chief, who welcomed them in the name of the maharaja. On their arrival at Lahore, Runjeet received them with all kindness—detained them near a month, entertaining them with hunting, hawking, and feasting, in the most splendid style. Although we have already given some specimens of the finery of the maharaja's establishment, we cannot omit the description of the old chief's bed-room.

"In one end of the room stood a camp-bedstead, which merits a description. Its frame-work, posts, and legs, were entirely covered with gold, and the canopy was one massy sheet of the same precious metal. It stood on footstools, raised about ten inches from the ground, and which were also of gold. The curtains were of Cashmere shawls. Near it stood a round chair of gold; and in one of the upper rooms of the palace we saw the counterpart of these costly ornaments. The candles that lighted up the apartment were held in branch sticks of gold. The little room in which we sat was superbly gilded; and the side which was next the court was closed by a screen of yellow silk. Here we enjoyed the society of our royal entertainer, who freely circulated the wine, filled our glasses himself, and gave every encouragement by his own example."—Vol. i. pp. 29, 30.

But the splendour of the Seik soldier, as displayed at Lahore, sinks into obscurity when compared with the magnificence which this old chief exhibited in the tented field, when Lord William Bentinck paid him a week's visit on the banks of the Sutlege, in the interval between the two missions of Mr. Burnes. The display of elephants with their rich houdas, the long line of troops, cavalry, infantry, and artillery, all in dresses of yellow silk, presented a most brilliant spectacle; but we must content ourselves with a short extract from the account of one of the spectators of scenes that outdid any thing in the "Thousand and One Nights:"—

"The tents were pitched on a rising bank, within a hundred yards of the river, and the lands around it were metamorphosed, by the skill of the gardeners of Lahore, into verdant parterres, in which wheat, having been sown some days previous, now presented groups of green and growing figures of elephants, horses, deer, birds, &c. This garden was brilliantly illuminated, and decorated with artificial flowers, trees, golden cypresses, &c., tastefully arranged. The interior of the pavilion, however, presented a scene of riches and splendour surpassing the descriptions of the palace of Haroon al Raschid, or of Solomon in all his glory. The floor was spread with cloth of gold; and within the gorgeous little pavilion before described, were placed three circular seats or thrones, sheeted with gold, curiously worked. The centre was destined for the maharaja, and one on either side for the governor-general and Lady William Bentinck. Behind these thrones was a golden bedstead, inlaid with diamonds, emeralds, rubies, &c., in profusion. The tent was illuminated with golden candelabras. After inspecting this *chef-d'œuvre* of oriental taste and magnificence, the party took their seats in the open arcade, or semiana, before described; the principal personages being seated under a canopy, the richness of which is utterly indescribable. It consisted of one mass of jewels, of diamonds, pearls, rubies, emeralds, interwoven in various patterns so thickly, that the texture of the cloth or silk on which they were worked was quite indistinguishable.

"The regiment of amazons soon made their appearance, on this occasion armed with bows and arrows, and headed by their commander-in-chief, the favourite of the day, who was distinguished by a crimson dress, and white plume in her turban. There were three subordinate commandants, each distinguished by a white plume. After exhibiting their dancing for some time, the maharaja ordered one of them to sing the song of the Hoolee, and a tray of round silver bowls, filled with gold dust and silver leaf pulverised, having been placed on a footstool before his highness, the sport and the song commenced. The dancer and the maharaja opened the campaign by pelting one another most vigorously with gold dust. Neither the governor-general nor Lady William escaped, and the engagement soon became general, and ceased only when three silver bowls were exhausted, and the whole party were covered from head to foot with the glittering powder. The maharaja suffered the most severely, for during his contest with the amazon, the latter contrived to throw a handful straight into his sound eye, which nearly extinguished the luminary, and he did not completely recover from the wound during the rest of the evening."

Mr. Burnes, on leaving Lahore, determined to cast off the garb of an Englishman, and adopt the costume of an humble Asiatic:—

"It now became necessary to divest ourselves almost of every thing which belonged to us, and discontinue many habits and practices which had become a second nature; but the success of our enterprise depended upon these sacrifices. We threw away all our European clothes, and adopted, without reserve, the costume of the Asiatic. We exchanged our tight dress for the flowing robe of the Afghans, girt on swords, and 'kummurbunds' (sashes); and, with our heads shaved, and groaning under ponderous turbans, we strutted about slipshod; and had now to uncover the feet instead of the head. We gave away our tents, beds, and boxes, and broke our tables and chairs. A hut, or the ground, we knew must be our shelter, and a coarse carpet or mat our bed. A blanket, or 'kummul,' served to cover the native saddle, and to sleep under during night: and the greater portion of my now limited wardrobe found a place in the 'koorjeen,' or saddle-bags, which were thrown across the horse's quarter. A single mule for each of us carried the whole of our baggage, with my books and instruments; and a servant likewise found a seat upon the animal. A pony carried the surveyor, Mohammed Ali; and the Hindoo lad had the same allowance. These arrangements took some time and consideration; and we burned, gave away, and destroyed whole mule-loads of baggage—a propitiatory offering, as I called it, to those immortal demons, the Rhyberees, who have from time immemorial plundered the traveller across the Indus."—Vol. i. pp. 40, 41.

The "tope," or mound of masonry, of Manikyala attracted the attention of Mr. Burnes. Mr. Elphinstone had pronounced it "as like Grecian architecture as any building which Europeans, in remote parts of the country, could now construct by the hands of unpractised native builders." M. Ventura, a general in Runjeet Sing's service, opened it, and descended down a central shaft, at the bottom of which he found various coins and

medals, and a nest of three cylindrical boxes, one of iron, one of tin, and the innermost of gold, containing a black, dirty substance, half liquid, and mixed with glass or amber. Though the coins were much posterior to the Greeks, M. Ventura thinks this must have been the site of Bucephalia, as the word Manikyala means, when interpreted, "the City of the Horse;" but Mr. Burnes is of opinion that it corresponds more nearly to Arrian's position of Taxilla. The latter found here two antiques and seventy copper coins. A similar "tope" was visited at Belur, and many others were heard of in the neighbourhood of the mountains. "I am inclined to a belief," says Mr. Burnes, "that in these 'topes' we have the tombs of a race of princes who once reigned in Upper India, and that they are either the sepulchres of the Bactrian kings, or their Indo-Scythic successors."

At Pind Dadun Khan, the capital of a small district, with a population of six thousand souls, the travellers crossed the Hydaspes. The river here turns round a point of the vast salt range which stretches from the Hydaspes to a considerable distance beyond the Indus, an extent nearly equal to two hundred miles. About one hundred persons were employed digging blocks of salt out of an excavation in the hill. Mr. Burnes says of these poor creatures that their cadaverous looks and stifled breathing excited the utmost compassion. He distributed to each a rupee, which was about equal to the earnings for extracting a ton of salt. The range is stated to rise about eight hundred feet above the plains of the Punjab, and about two thousand feet above the sea, and exceeds five miles in breadth. From this source Runjeet Sing derives a vast revenue.

Mr. Elphinstone crossed this salt range a little beyond the town of Calla-baugh, the houses of which, he says, actually overhang the road, being built on the steep face of the hill, the streets rising like steps one above another. Here the Indus was compressed between two mountains into a deep channel, only three hundred and fifty yards broad; along the face of one of these, a road has been cut for upwards of two miles, mostly out of solid salt, the cliffs rising sometimes to the height of more than a hundred feet above the level of the river; the mineral is described as hard, clear, and nearly pure, but streaked and tinged in parts with red. "The earth," says Mr. Elphinstone, "is almost blood-red, and this, with the strange and beautiful spectacle of the salt rocks, and the Indus flowing in a deep and clear stream through lofty mountains, past this extraordinary town, presented such a scene of wonder as is seldom to be witnessed." We should say, not to be witnessed in any other part of the known globe.

The scene of Alexander's battle with Porus has been conjectured to lie at Julalpoor, but Mr. Burnes seems to prefer Jelum, which is about twenty-five miles higher up the Hydaspes, chiefly because the great road from Tartary passes this place, and appears to have been the one followed by Alexander. Mr. Elphinstone, however, is not likely to give up Julalpoor: "So precisely does Quintus Curtius's description of the scene of Porus's battle correspond with the part of the Hydaspes where he crossed, that several gentlemen of the mission, who read the passage on the spot, were persuaded that it referred to the very spot before their eyes." *Non nostri est tantas componere lites;* but we wish, here and elsewhere, that Mr. Burnes had carried with him, not only his Curtius and Arrian, but the late clear and able "History of Alexander," by Archdeacon Williams. That learned writer's conjectures have, as it is, in several remarkable instances, derived new strength from Mr. Burnes's *facts*.

On the 14th March our travellers forded the Indus about five miles above Attock, where the stream was divided into three branches. Two hundred Seik horsemen conducted them over. With the exception of one man and two horses, that were carried down the stream and drowned, they arrived safe on the opposite bank.

They were now in the country of the Afghans, and delivered themselves over to the Khuttucks, a lawless tribe, whose chief expressed his dissatisfaction at their having purchased some trifling articles in the bazaar, as if it was a reflection on his hospitality. On taking leave, however, he assured them they might consider themselves "as secure as eggs under a hen." Being now in the land "where covetousness of a neighbour's goods is the ruling passion," it was found necessary to secrete their money and valuables in the best manner they could contrive. On approaching the plain of Peshawur they were met by an escort, and the son of the chief, who conducted them to his father, by whom they were received with the greatest kindness. Of this chief Mr. Burnes says—

"Sooltan Mahomed Khan was not the illiterate Afghan whom I expected to find, but an educated, well-bred gentleman, whose open and affable manner made a lasting impression upon me. As we were sitting down to dinner, he would frequently slip in, quite unattended, and pass the evening with us. He would sometimes be followed by various trays of dishes, which he had had cooked in his harem, and believed might be palatable to us. He is a person more remarkable for his urbanity than his wisdom; but he transacts all his own business: he is a brave soldier; his seraglio has about thirty inmates, and he has already had a family of sixty children. He could not tell the exact number of survivors when I asked him."—Vol. i. p. 91.

"As we passed the suburbs of the city we discovered a crowd of people, and, on a nearer approach, saw the mangled bodies of a man and woman, the former not quite dead, lying on a dunghill. The crowd instantly surrounded the chief and our party, and one person stepped forward and represented, in a trembling attitude, to Sooltan Mahomed Khan, that he had discovered his wife in an act of infidelity, and had put both parties to death; he held the bloody sword in his hands, and described how he had committed the deed. His wife was pregnant, and already the mother of three children. The chief asked a few questions, which did not occupy him three minutes; he then said, in a loud voice, 'You have acted the part of a good Mahomedan, and performed a justifiable act.' He then moved on, and the crowd cried out 'Bravo!' ('Afreen!') The man was immediately set at liberty."—Vol. i. pp. 93, 94.

Mr. Burnes is naturally much shocked with this incident; but his expressions on the occasion

are too severe; he might have known, or remembered, that an injured husband in his own country will, under similar circumstances, be held by judge and jury to have "performed a justifiable act."

"Of the town of Peshawur," says Mr. Burnes, "I shall say nothing, since the graphic and accurate descriptions of Mr. Elphinstone require no addition." A great revolution, however, has occurred since Mr. Elphinstone's time. Instead of its remaining a monarchy, the Afghan country has been broken up into four chiefships—Peshawur, Cabool, Herat, and Candahar, by the misfortunes that befel the two sons of Timour Shah, Zemaun Shah and Shooja-ool-Moolk, now both at Lodiana, and the former, as observed by Mr. Elphinstone, blind, dethroned, and exiled, in a country which he had twice subdued. The present ruler of Peshawur is described as a very excellent character, and his courtiers exhibited more general knowledge than could have been expected in this remote region. The Khan spoke without reserve of Runjeet Sing, and sighed to be released from the disgrace of being obliged to pay him tribute and having his son a hostage at Lahore. Mr. Burnes observed that every one seemed to maintain an air of equality with the chief—even the meanest servant addressed him without ceremony. After a month's feasting and entertainments, and rambles about the city and its environs, where the climate, the gardens, and the landscape, are said to delight the senses, they took their departure for Cabool. Being now near the close of April, they had no longer to dread the snows of Cabool and Hindoo Coosh: the thermometer had risen from 60° at noon on their first arrival to 87°; the mulberries had ripened, and the snow had entirely disappeared from the hither range.

The river of Cabool was crossed on a raft supported on inflated skins; it was only two hundred and fifty yards wide, but ran with such rapidity that they were carried more than a mile before gaining the opposite bank. The precipices of the ravine, down which the river fell with great impetuosity, had now risen to the height of two thousand feet, and the stream was again to be crossed. Its rapidity, formed into eddies, wheeled them round, and they had the agreeable satisfaction of being told that, if carried some way down, there was a whirlpool, round which, if once enclosed in its circle, they might revolve, in hunger and giddiness, for a whole day. This reminds us of the two *padres* who were found by Condamine in an eddy of the Amazons, where they had been spinning round and round in their little skiff for a couple of days.

Julalabad, the residence of a Mahomedan chief, lies between two parallel mountains, clothed in snow, in the higher part of which it never melts, and this would give an elevation of about 15,000 feet. It is described as a small filthy town, with a bazaar of fifty shops, and a population of about two thousand souls. At Bala-bagh, rich gardens, producing the famous pomegranates without seed, and vines creeping up trees to the height of eighty feet from the ground, ascended up the steep close under the Snowy Mountains. Near Gundamuk clover and white daisies clothed the fields, and the mountains were covered with forests of pines, rising to within a thousand feet of perpetual snow. Here, too, is the garden of Neemla, celebrated as the field of battle in which Shooja-ool-Moolk lost his crown in 1809.

The party had scarcely entered Cabool before they heard of the misfortunes of Mr. Wolff, the Jewish missionary, who was then detained in a neighbouring village, and lost no time in despatching assistance to him. The situation of this eccentric fanatic excited the sympathy of our travellers, though mainly owing to his own imprudence; having assumed the character of a hadjee, he was soon discovered, and then, of course, beaten and plundered.

Our travellers were received most kindly into the house of Nawab Jubbar Khan, the amiable brother of the chief of Cabool. Mr. Burnes says—

"Never was a man more modest and more beloved; he will permit but a single attendant to follow him; and the people on the high and by ways stop to bless him; the politicians assail him at home to enter into intrigues, and yet he possesses the respect of the whole community, and has, at the present moment, a greater moral influence than any of the Barukzye family in Afghanistan. His manners are remarkably mild and pleasing; and from his dress one would not imagine him to be an influential member of a warlike family. It is delightful to be in his society, to witness his acts, and hear his conversation. He is particularly partial to Europeans, and makes every one of them his guest who enters Cabool. All the French officers in the Punjab lived with him, and keep up a friendly intercourse. Such is the *patriarch* of Cabool; he is now about fifty years of age; and such the master of the house in which we were so fortunate as to dwell."—Vol. i. p. 134.

The chief himself, Dost Mahomed Khan, appears to be a man of a very superior mind: his general knowledge and intelligence far beyond what could have been expected; his curiosity unbounded. In short, his friendly reception of the travellers, and his accomplished address, quite charmed them. Like most Asiatics, he had imagined that the great wealth of England was drawn from her Eastern empire; but when set right on this point, he observed, "This satisfactorily accounts for the subjection of India. You have left much of its wealth to the native princes; you have not had to encounter their despair, and you are just in your courts." With two such men as the governor and the patriarch, Cabool is in no immediate danger of internal convulsions. The capital is a bustling city, with a population of 60,000.

"In the evening, each shop is lighted up by a lamp suspended in front, which gives the city an appearance of being illuminated. The number of shops for the sale of dried fruits is remarkable, and their arrangement tasteful. Every trade has its separate bazaar, and all of them seem busy. There are booksellers and venders of paper, much of which is Russian, and of a blue colour. Around the bakers' shops crowds of people may be seen, waiting for their bread. I observed that they baked it by plastering it to the sides of the oven. Cabool is famed for its kabobs, or cooked meats, which are in great request: few cook at home. 'Rhuwash' was the dainty of the May season in Cabool. It is merely blanched rhubarb,

which is reared under a careful protection from the sun, and grows up rankly under the hills in the neighbourhood. Its flavour is delicious. 'Shabash rhuwash! Bravo rhuwash!' is the cry in the streets; and every one buys it. In the most crowded parts of the city there are story-tellers amusing the idlers, or dervises proclaiming the glories and deeds of the prophet."—Vol. i. pp. 145, 146.

Though Cabool is more than six thousand feet above the level of the sea, the number and variety of the fruit trees are quite remarkable. Mr. Burnes enumerates peaches, plums, apricots, pears, apples, quinces, cherries, walnuts, mulberries, pomegranates and vines, all growing in one garden. Vines are so plentiful, that for three months in the year the grapes are given to the cattle. They make a wine not unlike Madeira. The mulberries of Cabool are as much celebrated as are the pears of Peshawur; the apricot also is much esteemed, and they have fourteen different ways of preserving it. In short, fruit is more plentiful than bread, and is considered one of the necessaries of life. In the gardens are also plenty of nightingales, blackbirds, thrushes, doves, and magpies, which, with the fruits, reminded our travellers of England. The nawab sent Mr. Burnes, in a cage surrounded with cloth, a "Boolbool i huzar dastan," or *nightingale of a thousand tales*, which, he says, became so noisy a companion throughout the night, that he was obliged to send it away before he could sleep.

It has been for some time past a current opinion in the East, that the offspring of the lost tribes of Israel survive among the Afghans. This subject did not escape the inquisitive mind of Mr. Burnes. He goes through the genealogies, as current in the country, from the days of Nebuchadnezzar downwards, and adds,

"I can see no good reason for discrediting them, though there be some anachronisms, and the dates do not exactly correspond with those of the Old Testament. In the histories of Greece and Rome we find similar corruptions, as well as in the later works of the Arab and Mahomedan writers. The Afghans look like Jews; they say they are descended from Jews; and the younger brother marries the widow of the elder, according to the law of Moses. The Afghans entertain strong prejudices against the Jewish nation; which would, at least show that they had no desire to claim, without a just cause, a descent from them." [They do not claim a descent from *them*.] "Since some of the tribes of Israel came to the east, why should we not admit that the Afghans are their descendants, converted to Mahomedanism? I am aware that I am differing from a high authority; but I trust that I have made it appear on reasonable grounds.'—Vol. i. p. 164.

Mr. Elphinstone (the authority alluded to) declined the investigation of this curious subject, but at the same time did not conceal his opinion that their own accounts of their origin appeared to him fabulous. Carey and Marshman lean the other way, and have discovered that the Pushtoo or Afghan language contains more Hebrew words than that of any nation of India. Of this we think not much; but what seems more important, they quote also a learned Afghan, who says, "his nation are *beni Israel*, but not Yahood,"—sons of Israel, but not Jews. Until some profound and liberal scholar investigates the whole matter, nothing can be said. We must equally pause as to the numerous claims to a Grecian pedigree set up by certain chiefs in the valley of the Oxus and in Badackshan. Marco Polo is the first traveller who heard of such a tradition. Mr. Elphinstone was informed that the chief of Durwaz drew his lineage from Alexander, and Mr. Burnes found six other personages, to the north of the Oxus, claiming a like descent.

Mr. Burnes now commenced preparations for a journey over the Hindoo Koosh, or Snowy Mountains, and he found no difficulty in obtaining money on a letter of credit on the public treasury of Lodiana or Delhi; "a gratifying proof," he observes, "have we here of the high character of our nation, to find the bills of those who almost appeared as beggars, cashed without hesitation in a foreign and far-distant capital." The road which they had to pursue from Cabool to Balkh led along the valley of the Cabool river, and here the towering range of mountains often seemed to overhang the path. The sources of the river, at the head of the valley, are in two large ponds formed into preserves for fish. Mr. Burnes says, "we fed them with bread, which disappeared in a moment, torn from our hands by some thousands of them; they are molested by no one, since it is believed that a curse rests on the head of an intruder." The following succinct account will convey some idea of this western tail of the range of the vast Himalaya mountains:—

"We crossed the stupendous chain of mountains by six successive passes; and, after a journey of about 260 miles, and thirteen days, debouched, on the valley of the Oxus, at Khooloom, which is forty miles eastward of the ancient city of Balk. The first three passes lie between Cabool and Bameean, and two of them were so deeply covered with snow in the end of May, that we could only travel in the morning, when it was frozen, and would bear our horses. The three remaining passes north of Bameean were of lesser altitude, and free from snow. We commenced our journey at an elevation of 6600 feet, which is the height of the city of Cabool from the sea. We then followed the river of Cabool, which falls at the rate of fifty feet a mile, and reached its source at an elevation of 8,600 feet, where the snow was first encountered in the valley. We attained our greatest height at the passes called Hajeeguk and Kaloo, which were respectively 12,400 and 13,000 feet high, and covered with snow. None of the other passes exceed an altitude of 9000 feet; and from the last of them, called Kara Koottul, we descended the bed of a river, at the rate of sixty feet a mile, until we reached the plains of Toorkistan, where we had yet an elevation of 2000 feet above the sea."—Vol. ii. p. 240.

He adds, that the peaks of Koh-i-baba are covered with eternal snow for a considerable distance beneath their summits, the altitude of which he estimates at about 18,000 feet. But the true mountain of Hindoo Koosh, we are told, lies about a degree to the eastward of the present route.

"This great peak is visible from Cabool, and entirely enveloped in milk-white snow. I saw it also from Koondooz, on the north, at a distance of 150 miles. Its altitude must be considerable, for the travellers complain of the difficulty of breathing, and carry sugar and mulberries with them to ease their respiration; and the strongest of men suffer from giddiness and vomiting. Thousands of birds are also found dead on the snow: it is believed that they are

unable to fly from the violence of the winds; but it is more probable that they are prevented by the rarity of the atmosphere; yet birds are used to higher elevations than men and quadrupeds. They often attempt to walk across, and numbers of them are ensnared. The greatest silence is preserved in crossing Hindoo Koosh; and no one speaks loud, or fires a gun, lest the reverberation cause a fall of snow. But the most singular phenomenon on Hindoo Koosh appears to be the snow-worm, which is described to resemble the silk-worm in its mature state. This insect is only found in the regions of perpetual congelation, and dies on being removed from the snow. I do not suppose that the existence of the creature will be doubted, because I have not seen it, since I speak on the united testimony of many who have passed Hindoo Koosh."—Vol. ii. pp. 247, 248.

In the lower parts of these mountains, and on the hills, were seen vast flocks of the broad-tailed sheep, and numerous goats, browsing on the furze and dry grass, and the aromatic plants which grow among the rocks, and scent the air. Among these may be reckoned the asafœtida plant (*ferula asa-fœtida*), which was found flourishing in great luxuriance at an elevation of 7000 feet. The sheep are particularly fond of this plant; and it is eaten raw and much relished by the inhabitants, though the smell is nearly as strong in its fresh state, as in our shops as a drug. In the passes of these mountains, Mr. Burnes observed abundance of apricot trees, blackberry bushes, sweet briars, and hawthorn. The fuel used by the inhabitants is the dry stunted furze. Neither cedars, nor firs, nor trees of any kind, adorn the mountains of Hindoo Koosh. Before the party had reached the village of Bameean, they had already surmounted the "everlasting snows," which, however, by the existing maps, were still half a degree of latitude beyond them.

"Bameean is celebrated for its colossal idols and innumerable excavations, which are to be seen in all parts of the valley, for about eight miles, and still form the residence of the greater part of the population. They are called "Soomuch" by the people. A detached hill in the middle of the valley is quite honeycombed by them, and brings to our recollection the Troglodites of Alexander's historians. It is called the city of Ghoolghoola, and consists of a continued succession of caves in every direction, which are said to have been the work of a king named Julal. The hills are formed of indurated clay and pebbles, which renders their excavation a matter of little difficulty; but the great extent to which it has been carried excites attention. Some of them are finished in the shape of a dome, and have a carved frieze below the point from which the cupola springs. The inhabitants tell many remarkable tales of the caves of Bameean; one in particular—that a mother had lost her child among them, and recovered it after a lapse of twelve years! The tale need not be believed; but it will convey an idea of the extent of the works. There are excavations on all sides of the idols; and below the larger one-half a regiment might find quarters. Bameean is perhaps the city which Alexander founded at the base of Paropamisus, before entering Bactria. The country, indeed, from Cabool to Balkh, is yet styled 'Bakhtur Zumeen,' or Bakhtur country.

"There are no relics of Asiatic antiquity which have roused the curiosity of the learned more than the gigantic idols of Bameean. They consist of two figures, a male and a female; the one named Silsal, the other Shahmama. The figures are cut in alto relievo on the face of the hill. The male is the larger of the two, and about 120 feet high. It occupies a front of seventy feet; and the niche in which it is excavated extends about that depth into the hill. The female figure is cut in the same hill, at a distance of 200 yards, and is about half the size."—Vol. i. pp. 183-186.

It is further stated that the niches of both these idols have been, at one time, plastered and ornamented with paintings of human figures, but these antique limnings now only appear over the heads of the idols, where the colours are as vivid, and the lines as distinct, as any in the Egyptian tombs. These figures, Mr. Burnes says, are described in Sherif-o-deen's history of Tamerlane, and he adds, that they are considered to be the Lat and Munat of the Koran. His engravings of them are worth a hundred descriptions.

The Afghans are described as a sober, simple, steady people; a nation of children, who quarrel for trifles; fight and become friends; prone to idleness; will sit a whole day stupidly staring at each other; delight in sauntering about in their beautiful gardens in the evenings; dress well, and have the appearance of health and happiness: the chubby red cheeks of their children are remarkable. Their amusements are hunting, hawking, and quail-fighting. The Afghans, however, differ very much in the different tribes or clans into which they are divided, and violent feuds exist among them.

At Bameean the territory of Cabool ends, and at Syghan that of Mahomet Ali Beg, also an Usbek, begins, who however is alternately subject to Cabool and Koondooz, as the chiefs of these states happen to preponderate in power. Here there was a stricter attention paid to matters of religion than on the southern side of the mountains; and the travellers were particularly cautioned not to sleep with their feet towards Mecca. The last pass of the Indian Caucasus they had to cross was the Kara Koottul, or Black Pass, but they had yet a journey of ninety-five miles before they entirely cleared the mountains. The last march in the mountains brought the travellers to Khooloom, from whence they had a noble view of the country to the northward, sloping down to the Oxus. Since leaving Cabool, Mr. Burnes says they had slept in their clothes, halted among mud, waded through rivers, tumbled among snow, and now were sunned by heat; but these he considers only as the petty inconveniences of a traveller.

From Khooloom it was intended to proceed northerly to Balkh, but, to their surprise and mortification, the officers of the customs had despatched a messenger to report their arrival to the chief of Koondooz, and receive his instructions for their disposal. In two days he returned, bringing a summons for the strangers to repair to Koondooz, about sixty miles to the eastward. Mr. Burnes lost no time in proceeding thither, to make his appearance before Meer Moorad Beg, the chief of the Usbeks. He found him seated on a tiger skin, and stretching out his legs covered with huge boots, in contempt of all Eastern rules of decorum. He was tall in stature, his features harsh, his eyes small to deformity, his forehead broad and frowning, the whole cast of his countenance most repulsive, and he wanted the beard which adorns the countenance of most Oriental

people. Mr. Burnes having succeeded, by good management in passing for an Armenian, procured an order for his safe conduct beyond the frontier; and forthwith departed to rejoin his companions at Khooloom, glad to escape from the despot, as well as from Koondooz, which is one of the most insalubrious places in the swampy valley of the upper Oxus. Its population does not exceed 1500 souls. The united force of Murad Beg is stated to be 20,000 horse and six pieces of artillery, one of which is a thirty-six pounder, brought from Persia by Nadir Shah.

This despot of Koondooz was the cause of all the disasters that befel poor Moorcroft in the year 1824. Knowing that he was an Englishman, which is in these countries synonymous with a wealthy man, he ensnared him, with his companions and baggage, to Koondooz, and kept them prisoners until he had contrived to extort from them a sum of about 23,000 rupees: they were then allowed to depart; but his cupidity was encreased by what it fed on; and when Moorcroft was preparing to start for Bokhara, he and his party were surrounded by 400 horsemen, and again summoned to Koondooz. Nor was it concealed that the chief had resolved to seize on the remainder of their property and put the whole of them to death. Nothing therefore was left for Moorcroft but to take advantage of the night, to assume the dress of a native, and to fly for refuge to a holy man who dwelt beyond Koondooz, and who was known to have a powerful influence over the mind of the chief. He fell at his feet and claimed his protection for a stranger. This holy personage promised him security; he summoned Moorad Beg before him, and told him, at his peril, not to touch a hair of the traveller's head, nor of those of his party. Moorcroft was then permitted to pursue his journey to Bokhara, but unfortunately died on his return, about eighty miles from Balkh. Mr. Trebeck and Mr. Guthrie, his companions, also died of fever.

In the journey of the present travellers to Balkh, they passed Muzar, a small independency belonging to a priest, who superintends the worship at a shrine of great sanctity, dedicated to Ali, and built about 350 years ago. It was here that Mr. Trebeck expired and was buried. Mr. Burnes visited his grave, which was under the shade of a mulberry tree.

"This young man has left a most favourable impression of his good qualities throughout the countries which we passed; and I could not but feel for his melancholy fate. After burying his two European fellow-travellers, he sunk, at an early age, after four months' suffering in a far-distant country, without a friend, without assistance, and without consolation. The whole of his property was either embezzled by a priest who accompanied the party, or confiscated by *the holy men* of this sanctuary, who yet retain it: it consisted of some valuable horses, camp equipage, money, and a few printed books. All the manuscripts of Moorcroft have been fortunately recovered; and, in justice to an amiable man, who devoted his life to a passion for travel and research, they ought, long ere this, to have been published. The money did not fall into the hands of the people of Muzar; it may be traced, but I cannot say found."—Vol. i. pp. 233, 234.

But if the papers be in existence, and attainable, why not published? Mr. Burnes says that on entering the ancient city of Balkh, in the dominions of the King of Bokhara, they wound among its extensive ruins for nearly three miles before reaching a caravansary in the inhabited corner of this once proud "Mother of Cities." Its ruins extend, we are told, for a circuit of about twenty miles, consisting of fallen mosques and decayed tombs; and its present population does not amount to 2000 souls. It stands on a plain covered with inequalities, probably arising from ruins and rubbish. The city itself, like Babylon, has long been a perfect mine of bricks for the surrounding country; its gardens, once so celebrated, are overgrown with weeds, and its aqueducts dried up. Such is the present state of the ancient Bactria, which, after the conquest of Alexander, flourished under a succession of Grecian kings! The melancholy reflections to which such a place was calculated to give rise were enhanced by a visit to a lonely spot outside the city, where are the graves of poor Moorcroft and Guthrie, the bigoted people having refused them room in their burying-ground. "It was fortunate," says Mr. Burnes, "that the living experienced no such contempt as the dead, for we received no slight from any one, though our creed and our nation were not concealed."

From Balkh the party crossed the desert in company of a small caravan of twenty camels, each camel being laden with a couple of panniers, as lately described in our notice of Conolly. They slept in the open air, a coarse blanket being their only covering, all their nourishment bread and tea. The country was destitute of wood and water, "and its stunted herbage either protruded from mounds of loose drifting sand, or made its appearance through sheets of hard clay." The place where they had to cross the Jihon or Amoo (the ancient Oxus,) afforded some little cultivation by means of aqueducts from the river. It was here eight hundred yards wide and about twenty feet deep, with a current of about three miles and a half an hour. The mode of crossing it is singular.

"We were drawn by a pair of horses, who were yoked to the boat on each bow, by a rope fixed to the hair of the mane. The bridle is then put on as if the horse were to be mounted; the boat is pushed into the stream, and, without any other assistance than the horses, is ferried directly across the most rapid channel. A man on board holds the reins of each horse, and allows them to play loosely in the mouth urging him to swim; and, thus guided, he advances without difficulty. There is not an oar to aid in impelling the boat; and the only assistance from those on board consists in manœuvring a rude rounded pole at the stern, to prevent the vessel from wheeling to the current, and to give both horses clear water to swim."—Vol. i. pp. 249, 50.

After crossing a desert, on the northern side of the Oxus, of eighty-five miles without seeing a tree, they entered the small oasis of Kurshee, which contains a little town about a mile long, with a considerable bazaar and about ten thousand inhabitants, being the largest place in the kingdom of Bokhara next to the capital. A small river expends itself in the oasis by enabling the inhabitants to form and cultivate their numerous

gardens. It rises at Shuhr Suby, about fifty miles to the northeast, famous as being the birth-place of Timour, and about the same distance from Samarcand. The mention of this latter place makes us regret exceedingly that it was not visited by Mr. Burnes; for though we have little doubt it would present pretty much the same melancholy aspect as Balkh, yet, being once a city of such renown, and lost as it were from all knowledge of Europeans for many centuries, a journey to it of a hundred miles would have added a singularly interesting episode to his narrative, had it been for no other purpose than to have viewed the observatory of the justly celebrated Uleg Beg, which is said to be still in a perfect state, as is also the tomb of the no less celebrated Timour.

Viewing these countries in their present wretched and sterile condition, it is a severe tax on our belief, when we read of an Arab governor of Samarcand making a boast that he could take the field with 300,000 horse and as many foot, and that they would not be missed in the province; or that 700,000 Monguls and Tartars, under Gengiskhan, met and engaged 400,000 troops of the Sultan of Khiva, in the midst of the now direful deserts of Mawenelhanar, then the first of earthly paradises, and the happiest region of the globe! But, dismissing these and all such like Arabian hyperboles, we have the testimony of Clavijo, the ambassador of Henry III. of Castile to Timour, as to the splendour, the magnificence, and the multitudes that were assembled on the plains of Samarcand, on the marriage of six of that emperor's grandsons. On this occasion, the insolence as well as the grandeur of the barbarian was singularly displayed. When seated on his throne, he was told that an ambassador from one of the principal countries of Europe was in attendance: "Let him approach," says he; "the shrimp has its place in the ocean." Gibbon, emulating the oriental grandiloquence of the Persian historian from whom he has drawn his account of this fête, tells us that "whole forests were cut down to supply fuel for the kitchens; and the plain was spread with pyramids of meat, and vases of every liquor, to which thousands of guests were courteously invited." He goes on to say that, "After the marriage contracts had been ratified, the bridegrooms and their brides retired to their nuptial chambers; nine times, according to the Asiatic fashion, they were dressed and undressed; and at each change of apparel, pearls and rubies were showered on their heads, and contemptuously abandoned to their attendants: a general indulgence was proclaimed; every law was relaxed, the people were free, the sovereign was idle:"—in other words, as we gather from Clavijo, the emperor, his sultanas, his grandsons, their brides, and attendants, all got royally and gloriously drunk.

In the route of our travellers from Kurshee towards Bokhara is the village of Karsan, at the extremity of the oasis. It was market day, and a vast throng were passed on their way thither, but all were equestrians—not a single individual on foot. It much amused Mr. Burnes to see here a man jogging along to market with his wife on a pillion behind him. We venture to say that in the days of his own grandmother, no farmer's wife in his own country ever went to market in any other fashion. "We now," says he, "found ourselves among the Usbeks, a grave, broad-faced, peaceable people, with a Tartar expression of countenance." He calls them, however, in another part of his journey, "the ferocious and man-selling Usbeks." It is no crime, according to the Koran, by which they are chiefly governed, to trade in slaves, which the Toorkmuns of the desert seize from the Persians and sell to the Usbeks, who again dispose of them at a profit. Bokhara, after a most fatiguing journey, was now at hand, but there was nothing striking in the approach to it; the country is flat, but richly clothed, and the trees concealed the walls and the mosques till the party were close upon them. The first thing, after entering this city, was to exchange their turbans for shabby sheep-skin caps, with the fur inside and their "Kumberbunds," or girdles, for a rude piece of rope—in short, to hoist signals of poverty. On the same day Mr. Burnes was summoned to wait on the minister, to whom he had previously announced his approach. He had to walk two miles through the streets before he reached the palace, or citadel. He found the Koosh Begee, or lord of all the Begs, sitting in a small room, who desired him to be seated outside on the hard pavement; but our traveller did not break his heart at this seeming indignity, as the minister's son was seated farther off than himself. Mr. Burnes presented a silver watch and a Cashmere dress, but the minister declined receiving any thing, saying that he was but the slave of the king. He kept Mr. Burnes about two hours, questioning him on a great variety of subjects—what had brought him to Bokhara—what was his profession—his knowledge—his baggage—and so on—but he concluded by assuring him of his protection, enjoining him, however, on no account, while in Bokhara, to make use of pen and ink.

He soon sent for him a second time, and enquired, among other things, whether he had any thing curious to exhibit. It occurred to Mr. Burnes that a patent compass might serve the turn; he sallied forth to fetch it, and when he had pointed out its utility, the old man seemed to have forgotten "that he was but the slave of the king." The Koosh Begee packed up the compass with all the haste and anxiety of a child, and said he would take it direct to his majesty, to manifest the wonderful ingenuity of our nation. Mr. Burnes had abundance of time during the month he continued here to see every thing worth seeing in Bokhara, but, like other foreigners, was prohibited from mounting a horse within the city walls. The following description of the great bazaar, the common resort of all nations, conveys a clear notion of what passes daily in this holy city:—

"On two other sides there are massive buildings, colleges of the learned; and on the fourth side is a fountain, filled with water, and shaded by lofty trees, while idlers and newsmongers assemble round the wares of Asia and Europe, which are here exposed for sale. A stranger has only to seat himself on a bench of the Registan, to know the Usbeks and the people of Bokhara. He may here converse with the natives of Persia, Turkey,

Russia, Tartary, China, India, and Cabool. He will meet with Toorkmuns, Calmuks, and Kuzzaks, from the surrounding deserts, as well as the natives of more favoured lands. He may contrast the polished manners of the subjects of the "Great King" with the ruder habits of a roaming Tartar. A red beard, grey eyes, and fair skin, will now and then arrest the notice of a stranger, and his attention will have been fixed on a poor Russian, who has lost his country and his liberty, and here drags out a miserable life of slavery. A native of China may be seen here and there in the same forlorn predicament, shorn of his long cue of hair, with his crown under a turban, since both he and the Russian act the part of Mahomedans. Then follows a Hindoo, in a garb foreign to himself and his country. A small square cap and a string, instead of a girdle, distinguishes him from the Mahomedans, and, as the Moslems themselves tell you, prevents their profaning the prescribed salutations of their language by using them to an idolater. Without these distinctions, the native of India is to be recognised by his demure look, and the studious manner in which he avoids all communication with the crowd. He herds only with a few individuals, similarly circumstanced with himself. The Jew is as marked a being as the Hindoo: he wears a somewhat different dress, and a conical cap. No mark, however, is so distinguishing as the well-known features of the Hebrew people. In Bokhara, they are a race remarkably handsome, and I saw more than one Rebecca in my peregrinations. Their features are set off by ringlets of beautiful hair hanging over their cheeks and neck. There are about 4000 Jews in Bokhara, emigrants from Meshid, in Persia, who are chiefly employed in dyeing cloth. They receive the same treatment as the Hindoos. A stray Armenian, in a still different dress, represents his wandering nation; but there are few of them in Bokhara. With these exceptions, the stranger beholds in the bazaar a portly, fair, and well-dressed mass of people, the Mahomedans of Toorkistan.

"A large white turban, and a pelisse of some dark colour, over three or four others of the same description, is the general costume: but some of the higher persons are clothed in brocade—and one may distinguish the gradations of the chiefs, since those in favour ride into the citadel, and the others dismount at the gate. A great portion appear on horseback; but, whether mounted or on foot, they are dressed in boots; and the pedestrians strut on high and small heels, in which it was difficult for me to walk or even stand: they are about an inch and a half high, and the pinnacle is not one third the diameter. This is the national dress of the Usbeks. Some men of rank have a shoe over the boot, which is taken off on entering a room. I must not forget the ladies in my enumeration of the inhabitants: they generally appear on horseback, riding as the men; a few walk, and are all veiled with a black hair cloth. The difficulty of seeing through it makes the fair ones stare at every one as in a masquerade. Here, however, no one must speak to them; and if any of the king's haram pass, you are admonished to look in another direction, and get a blow on the head if you neglect the advice. So holy are the fair ones of the 'holy Bokhara.'"—Vol. i. pp. 272—276.

From morn till night, the crowd emits a humming noise, and "one is stunned," says our author, "at the moving mass of human beings. One wonders at the never-ending employment of the fruiterers in dealing out their grapes, melons, apricots, apples, peaches, pears, and plums, to a continued succession of purchasers." The demand for tea is equally great; it is drank as in China, at all times and places, with and without sugar, with and without milk, with grease, salt, &c. Grape-jelly, mixed up with chopped ice, is "the delight of life" (*rahut i jan*). Ice, it seems, is pitted in winter, and so abundant, that the poorest people can afford to buy it. "No one ever thinks of drinking water in Bokhara without icing it; and a beggar may be seen purchasing it, as he proclaims his poverty and entreats the bounty of the passenger." The busy scene closes with the twilight; the king's drum beats; it is re-echoed by others in every part of the city—and after this no one is permitted to stir abroad without a lantern.

It was natural enough that Mr. Burnes should desire to see the king, after so many friendly visits to the vizier, but on expressing a wish to tha effect, he found "he had touched a delicate point." The wary minister suspected that some proposal might be made to his majesty, which had been concealed from himself: his reply was, "I am as good as the Ameer, and if you have no matters of business to transact with the king, what have travellers to do with courts?" He was, therefore, obliged to be content with seeing the "Commander of the Faithful" as he went to his prayers. He appeared under thirty years of age, his countenance not prepossessing, his eyes being small, his visage gaunt and pale. The Koran was carried before him; the mace-bearers exclaimed, as they went along, "Pray to God that the Commander of the Faithful may act justly!" His character is said to stand high among his countrymen: yet, from what follows, it would seem that he does not trust them.

"The life of this king is less enviable than that of most private men. The water which he drinks is brought in skins from the river, under the charge and seal of two officers. It is opened by the vizier, first tasted by his people and then by himself, when it is once more sealed and despatched to the king. The daily meals of his majesty undergo a like scrutiny; the minister eats, he gives to those around him, they wait the lapse of an hour to judge of their effect, when they are locked up in a box and despatched. His majesty has one key, and his minister another. Fruit, sweetmeats, and every eatable undergo the same examination, and we shall hardly suppose the good king of the Usbeks ever enjoys a hot meal or a fresh-cooked dinner. Poison is common, and the rise of his majesty himself to the throne on which he now sits is not without strong suspicions of a free distribution of such draughts. A native, on one occasion, presented me with some figs, one of which I took and ate, to show him that I appreciated the gift. The individual cautioned me against such indiscretion in future: 'Since,' said he, 'you should always present some of the gift in the first instance to the giver, and if he eats, you may with safety follow his example.'"—vol. i. pp. 293, 294.

The palace, the mosques, and the colleges occupy a very large proportion of the city of Bokhara. Of the latter, Mr. Burnes says there are about 366, great and small, a third part of which are large buildings, each containing upwards of seventy or eighty students; that is to say, there cannot be fewer than 12,000 of these lazy animals who "are entirely occupied with theology, which has superseded all other points; they are quite ignorant even of the historical annals of their country. A more perfect set of drones were

never assembled together; and they are a body of men regardless of their religion in most respects beyond the performance of its prayers." We believe we were quite right, when, in reviewing Meyendorff's book,* we said, that "nothing appeared to flourish but praying and concubinage, which are sometimes found to go together in other countries besides Mawenelnahar." The Mollahs set the example of the one, and the "Commander of the Faithful" of both.

While at Bokhara, Mr. Burnes was desirous of meeting with some of the Russian slaves, who he was told amounted to about one hundred and thirty in the whole kingdom, but that the purchase and sale of them had ceased for the last ten years.

"One evening a stout and manly-looking person fell at my feet and kissed them. He was a Russian of the name of Gregory Pulakoff, who had been kidnapped when asleep at a Russian outpost, about twenty-five years ago. He was the son of a soldier, and now followed the trade of a carpenter. I made him sit down with us, and give an account of his woes and condition: it was our dinner-time, and the poor carpenter helped us to eat our pilao. Though but ten years of age when captured, he yet retained his native language, and the most ardent wish to return to his country. He paid seven tillas a year to his master, who allowed him to practise his trade and keep all he might earn beyond that sum. He had a wife and child, also slaves. 'I am well treated by my master,' said he; 'I go where I choose; I associate with the people, and play the part of a Mahomedan; I appear happy, but my heart burns for my native land, where I would serve in the most despotic army with gladness. Could I but see it again, I would willingly die. I tell you my feelings, but I smother them from the Usbeks. I am yet a Christian (here the poor fellow crossed himself after the manner of the Greek church), and I live among a people who detest, with the utmost cordiality, every individual of that creed. It is only for my own peace that I call myself a Mahomedan.'"—Vol. i. p. 294–5.

It is stated, however, that many of these Russians who are held in slavery were soldiers who, from the severity of discipline on the frontier station, had voluntarily deserted their posts, and thrown themselves into that condition. It was the wish of Mr. Burnes to have gone by Khiva to the Caspian, but a feud between the khan of this oasis and the kerghis of the steppe made it unsafe. The caravan, of which our travellers made a part, proceeded about forty miles to a place called Meerabad, beyond which the merchants declined to advance on account of the disturbed state of the country. They were, therefore, detained nearly a month; but it afforded some compensation to inquisitive travellers to feel persuaded that they were on classical ground —that the river of Bokhara, or the Kohik (which does not fall into the Oxus as represented on the maps, but loses itself in the lake Dengis), is the same river as that which was known to the Greeks by the name of Polytimetus. This conclusion is drawn from the text of Arrian, who states it to be *lost in the sands*—while Curtius leads its waters *into a cavern*—either of which *may* mean the same thing as losing itself in a lake. The story of Alexander's encountering the lion in this neighbourhood must be a geographical error, for, as Horrebow, in his *Chapter on Owls*, laconically informs his readers, "there are no owls in Iceland," so may we venture to assure ours that there are no lions in Bokhara—nor is there any creditable testimony that the king of beasts ever condescended to illustrate the sandy plains of Mawenelnahar.

Proceeding at length to the southward, our travellers crossed the Oxus a second time, at Betick, opposite to Charjooee, (placed in former maps on the wrong side of the river,) one of the greatest ferries between Persia and Toorkistan. The farmer of the ferry informed them that, in the year preceding, the Oxus was frozen from shore to shore, so that caravans crossed it on the ice. The farmer requested the king to allow him to tax the passengers: "That," said the king, "is impossible, unless you agree to pay the blood-money of all those who may fall through the ice and perish;" and every body applauded the wisdom of the king except the farmer. The river was here six hundred and fifty yards broad, and from twenty-five to twenty-nine feet deep. Mr. Burnes heard of a kind of dog-fish caught in it, weighing from five hundred to six hundred pounds, and used as food by the Usbeks.

They had now before them a journey of one hundred and fifty miles, across a part of the great desert of the Toorkmuns, before they should reach the Moorghab river, near the town of Merve, about fifty miles beyond which it loses itself in a lake. The caravan consisted of about eighty camels and one hundred and fifty persons, some proceeding in panniers placed on camels, some on horses, and others on donkeys—several of them were Persians returning home after many years of slavery. We need not stop to describe the dangers, inconveniences, and privations, of those who have to cross sandy deserts, whether in Asia or in Africa, as they are all pretty nearly of the same character. The second volume contains by far the most full and graphical picture of Toorkman life that we have ever met with: it is here indeed that Mr. Burnes's abilities, as a mere writer, are most advantageously displayed—and we may say the same as to his admirable personal qualities, his prudence, courage, calm temper, and resolution of purpose, which are carried home to our feelings by his perfect simplicity and modest unconsciousness; but our limits compel us to spare quotation.

Having surmounted the pass of Durbund and the fort of Moozderan, they were not long in entering the sacred city of Meshid, where Lieut. Burnes had the gratification of meeting with Captain and Mrs. Shee, the first Europeans the party had fallen in with since leaving the Punjab. Meshid is but a miserable place, but "still," as Lieut. Burnes observes, "it is the burial-place of the great Nadir Shah."

"His grave, now dishonoured and marked by the ruins of the edifice that once sheltered it from the elements, is one of the most interesting sights to a traveller. What a field for rumination is such a spot! The fountains and flowers which encircled it have disappeared; the peach tree, which put forth its blossom on the returning spring, has fallen under the axe, and the willows and

* Quarterly Review, vol. xxxvi. p. 118.

cypresses have been torn down. In their place a crop of turnips had been sown by some industrious citizen. Shade of Nadir, what a change is here! He who shook the kingdoms of the east, has been denied in death the small quadrangle of a garden which the affection of sons had hallowed to the merit of a parent. This is the reward of him who delivered his country from a foreign usurper, and who studied his country's good; but the well-being of a state does not necessarily comprehend the well-being of *all* its members. Nadir aimed the blows of despotism at the family which has succeeded to his empire, and he maimed the successful individual who seized upon his kingdom and ejected his sons. Aga Mahomed Khan was mutilated in his youth by Nadir; but he retained the feelings of a man, and dug up the bones of the conqueror in revenge for his disgrace. Report adds that he sent them to Tehran, and placed them under the step which leads to the audience hall, that the courtiers and every one might trample upon them. We can readily comprehend the chagrin of a monarch who was not a man; and if his wrath excites our contempt, it enlists our sympathy. A eunuch himself, he spared his country from those banes of a palace. There are still some of Nadir's descendants living in Meshid; but they are blind and in destitute circumstances. My informant told me that they often applied to him for bread."—Vol. ii. pp. 83—85.

Mr. Burnes now proceeded through the valley of Meshid to Kooehan, where he had an interview with the late Prince Abbas Meerza, who was sufficiently inquisitive respecting various parts of the world, even as far as New Holland. From thence he proceeded to Astrabad, on the southeast corner of the Caspian, which Mr. Burnes tells us he did not leave "without endeavouring to verify the opinions regarding its level, which is clearly below that of the ocean." He certainly was not in possession of the means of doing this with any approach to accuracy; and we are not therefore surprised he should make its depression eight hundred feet below the sea, which is more than double of what it has been ascertained to be by the two Germans, who actually leveled the whole way from the Black Sea to the Caspian, and whose result has been confirmed by the thermometrical observations of Colonel Monteith.

Quitting the shores of the Caspian, Mr. Burnes made the best of his way to Teheran, thence to Ispahan, Moorghaub, Shiraz, and Busheer, where he embarked on board the East India Company's ship the Clive, and anchored in the harbour of Bombay on the 18th January, 1833, having spent little more than a year on his long and highly interesting journey. A very excellent map, embracing the whole of Central Asia, with many geographical emendations and corrections, and the routes of the two missions marked thereon, has been prepared and published, we regret to add, *separately*, by Mr. Arrowsmith.

We cannot part with Mr. Burnes without again expressing our high sense of the abilities which he has displayed in action—and, notwithstanding some defects of plan and arrangement, as a vivid and powerful describer of natural scenes and human manners. Many years have passed since the English library has been enriched with a book of travels in value at all comparable with his. He is evidently a man of strong and masculine talents, high spirit, and elegant taste—and we expect, if the affairs of our Indian empire are allowed to go on in any thing like a proper manner, to have future occasions for noticing the exertions of one who appears, in every respect, well qualified to tread in the steps of our Malcolms and Elphinstones.

From the United Service Journal.

TRADITIONS OF THE AMERICAN WAR OF INDEPENDENCE.—NO. II.

Our tradition this month is from an humbler pen than that which furnished our former sketch, and relates to a widely different subject. Yet we give it without scruple. It is extracted from the journal of an officer, likewise dead, who saw much service in his day, and kept a record of it. We need scarcely add that Champe's story is given, as far as we can judge, in his own words. He seems to have been an educated person; and his prejudices, though here and there somewhat coarsely expressed, are very natural. But our readers shall judge for themselves.

—

Every one acquainted with the characteristic distinctions between wars strictly civil and those which one nation wages with another, is aware that desertions occur much more frequently in the former than in the latter. Neither is it a hard matter to account for the fact. Though we speak of civil wars as of wars of principle, no one can be ignorant that, comparatively, few of the combatants are, on either side, actuated by any such motive. The chiefs or leaders may sometimes be sincere; they may have taken the field under a strong sense of moral obligation—and a strong sense of moral obligation will enable men to bear up against a thousand inconveniences; but the great body of their followers follow either from a sense of personal regard towards those under whose banners they have enlisted, or—and this is much more frequently the case—for hire. Now, where there is no difference of language to affect them, no dread of perpetual exile to hold them back, but a knowledge that, whether with one army or another, they are still at home and among their countrymen, it cannot excite surprise if the uneducated soldiers should permit a feeling of wrong, real or imaginary, or the temptation of increased pay and better allowances, to draw them at any moment away from their duty. I believe, therefore, that every where, when a collision of parties in a state has taken place, treasons will be seen to have abounded; and no one can doubt that they will continue so to do till human nature shall have become altogether different from what it is.

The war of American independence, though waged in a remote part of the globe, was, in some sense, a civil war. It was therefore marked, at every stage, by numerous instances of desertion—of desertion which occurred, however, much more frequently among the Americans than among their opponents. Our colonial warriors did, indeed, occasionally give us the slip;—they were at home—most of them had relatives, all had friends, in the ranks of the opposite party;

and hence, as often as caprice or discontent got the better of them, they walked away without scruple. But while the native Englishman stood by his colours patiently and gallantly to the last, of Americans so many came in, that it was sometimes a matter of perplexity how to dispose of them. The following history of the adventures of one of these, collected from his own statements, and confirmed from other sources, seems to be worthy of record, and I therefore give it a place in my journal.

During the summer of 1780, when, in spite of the failure of Burgoyne's expedition, hopes were still entertained of a successful termination to the struggle, it was customary for certain galleys and other armed vessels to keep guard in the North River, as far from the outworks of New York as Elizabeth Town Point in one direction, and King's Bridge in another. It chanced on a certain day in September (I think it was the twenty-fifth or twenty-sixth) that two of these lay at single anchor about four or five miles from the village of Bergen. They had been stationed there ever since the sad news of André's capture reached us, whether with the view of facilitating his chances of escape, if such should occur, or as a point of communication for the conveyance of intelligence, I know not, but in either case without having achieved any important service, when, on the morning of the day just specified, an event befel which relieved their crews for the moment from the tedium of a profitless watch. It might be about nine o'clock in the morning when the look-out seamen called the attention of one of the commanders to what was passing on shore. The latter turned his glass in the direction specified, and beheld, coming from Bergen, a single horseman, who rode as if for life and death, and directed his face towards the river. He was dressed in the well known uniform of Lee's Legion—one of the best equipped and most efficient corps in the American service,—and his valice being strapped at the croup of the saddle, and his sword hung at his side, it was evident that some cause more urgent than caprice drove him on. When first discovered he was in the act of rounding a corner in the wood, so as to enter upon a broad and straight road that had been cut through its centre, which leading directly to the water's edge, or rather to the edge of a reedy swamp which at this particular part girdled in the Hudson, then branched off to the right and left, and followed, both upwards and downwards, the tortuosities of the stream.

The horseman rode furiously till he had left the corner of the wood about three hundred yards behind, when he suddenly pulled up; he then unbuckled his valice, and strapped it across his shoulders; unslung his sword, drew out the weapon, and cast the scabbard and belt from him; and turning from time to time an anxious glance to the rear, seemed to brace himself, as it were, for some desperate hazard. Nor did many minutes elapse ere the cause of this apparent anxiety became manifest: his preparations were as yet incomplete when a party of dragoons, perhaps twelve or fourteen in number, made their appearance rounding the same angle from which he had emerged. They were too far distant to permit the sound of their voices to be heard; but nothing could be more remarkable than the effect produced on all parties by so sudden a recognition. The fugitive plunged his spurs into the flanks of his charger, and set off again at the top of his speed. The troopers pressed their animals to increased exertion; and the latter being, as it seemed, more fresh than the former, the distance between them was certainly not increased; on the contrary, they gained upon him so fast, that when at length he reached the margin of the swamp, not more than sixty or seventy yards divided them.

And now the seamen, who had watched the proceeding with feelings not unlike those which are experienced by the spectators of a coursing match, found themselves called upon to play a part in the strange drama. For the fugitive threw himself from his saddle, rushed into the morass, and shouting aloud for help, made at once for the water's edge; dressed as he was, moreover, he did not hesitate to plunge into the river and to strike out lustily towards the anchorage. In a word, he was a deserter; and, as both policy and justice required, it became necessary to afford to him every facility of escape. Accordingly, both vessels opened a fire of grape upon the dragoons; a boat was pushed off likewise, which soon picked up the swimmer, and he was conveyed safely on board of the nearest of the galleys. Having given his name, and assigned the common reason for conduct such as his—namely that he had been ill-treated by his officers, and was weary of so bad a service—he expressed a wish to be passed on to New York; and he was immediately sent forward in a row-boat, under a proper escort, with a letter from the captain testifying to the manner of his arrival.

There were many circumstances which concurred at this time to give to every individual instance of desertion more than its common interest in the eyes of the commander-in-chief. In the first place his correspondence with General Arnold had led him, for some time, to believe that much dissatisfaction prevailed in Washington's army. In the next place, the failure of Arnold's plot, and the arrest of poor André, rendered him peculiarly sensitive, and induced him to listen with credulous anxiety to every tale or rumour which might so much as seem to confirm hopes that had in reality no foundation. Each fugitive was, in consequence, conducted to head-quarters where he was closely interrogated as to the dispositions of the enemy's troops, and, above all, concerning the tempers of certain officers, of whose fidelity to the republican cause our chiefs had learned to think lightly. Among others the new comer was honoured with a private interview, during which he underwent a long and rigid examination, though of the particulars of that examination I knew at the moment nothing more than its result was highly favourable to the deserter; for the general spoke of him publicly as an intelligent and prudent person, and made no secret of his wish to enlist talent so valuable in the military service of his sovereign. For a while the stranger resisted this proposition: he professed to be tired of war, and reminded Sir

Henry, not unfairly, that from the moment he assumed the king's uniform, he put a halter about his own neck. But the importunities of those in power at length prevailed; and he consented to accept the same rank in the royal army which he had borne in the army of the States. He was accordingly attached to a corps, of which Arnold took the command, composed exclusively of native Americans, most of whom had deserted; and being strongly recommended to Arnold himself, as well by his own personal demeanour as by the commander-in-chief, he became a sort of orderly-sergeant in that officer's family.

Time passed, and the melancholy news arrived that neither entreaties nor threats of retaliation, nor offers of exchange, had availed to save the life of the gallant André. He died a traitor's death, by a law too severe, even in extreme cases, and unquestionably carried far beyond its legitimate interpretation in his. There was a general lamentation throughout the ranks, mingled with an eager longing for revenge, in which no man appeared more earnestly to participate than General Arnold; and partly with a view of indulging the humour, partly to effect a diversion in favour of Lord Cornwallis, then actively engaged in the Carolinas, it was determined to send his legion, together with one or two battalions of regulars, on an expedition into Virginia. This resolution, which was come to at a late hour in the evening, was announced early next morning in general orders; and the order itself was obeyed with such remarkable promptitude that the men went on board without time having been afforded for making any preparations whatever. Yet the transports continued at their moorings many days; nor was it till late in October that the corps made good its landing, and opened a brief and profitless campaign on the shores of the Chesapeake.

Fortune so ordered it that there was given to me, then a very young man, a company in Arnold's legion, and that the deserter, John Champe, was attached to it. I found him to be, as others had represented, a remarkably intelligent person. At first, indeed, he proved singularly grave and taciturn—nay, his manner appeared at times to indicate so much of moroseness and ill-humour, that I could not avoid harbouring a latent suspicion that he already repented of the step which he had taken. But having been forewarned of the reluctance which accompanied his enlistment, I took no notice of this humour; and as I treated him throughout as kindly as circumstances would allow, I flattered myself that I had at last succeeded in gaining his confidence. It is true that of cheerfulness he never exhibited a symptom. His cast of features and dark and saturnine complexion seemed to mark him as a man naturally thoughtful, perhaps designing. Yet he was a good soldier, in his outward appearance at least; and I put full confidence in the statements of those who assured me that the contents of the volume would be found correspondent with its binding. How far my expectations had or had not been well founded, an opportunity of determining was never afforded, inasmuch as the second night after the disembarkation, Sergeant Champe disappeared. He was sought for far and near; his arms were found, and his knapsack, neither had any one seen him quit the lines; but he himself was gone; and never again, during the remainder of the war, was so much as a trace of him discovered.

At last the peace came; and I, who had formed a connection with a respectable republican family in Virginia, received permission to remain in the country after my regiment quitted it, for the purpose of settling my affairs. I was journeying for this purpose through Loudon county, attended by a single servant, on horseback, when, towards the close of a summer's day, I found myself unexpectedly brought to a stand-still by the occurrence of three roads leading towards three different points of the compass. As there was no board or sign-post erected for the guidance of travellers, I felt, as a stranger so circumstanced is apt to do, a good deal puzzled. I looked to the heavens, but did not succeed in ascertaining, by any sign afforded there, in which direction I ought to turn; so, after hesitating for some time, I struck into one of the paths which appeared to be somewhat more inviting than the rest, and followed it for a while, if not without misgivings, at all events in good hope that I had done right. But the road began by degrees to twist and turn; it carried me deep into the heart of the forest, and as the night was coming on, with every appearance of a thunderstorm, I began to grow impatient and uneasy. I pressed my jaded beast into a trot, but had made very little progress when darkness closed in—darkness so dense that to discern objects at a yard's distance was impossible. What was now to be done? Even if I should endeavour to retrace my steps, I did not know where shelter was to be found. I might again take a wrong turn; and even if I did not, I perfectly recollected that many miles of way must be traversed ere I should reach a human habitation. If I went on I might get bewildered amid the savannah, or drowned in a morass; if I stood still, I must make up my mind to a thorough soaking, without being able to appease my own hunger, or that of my over-wrought animals. In this emergency I did, what most men probably would have done, I called my servant to council; and, after brief deliberation, it was determined that our case was desperate, and that we had better brave evils of which we knew the extent, than flounder on at random into others.

Having arrived at this sage conclusion, we alighted, and fastening our beasts by their halters to the bough of a huge tree, we sat down with our backs against its stem. No conversation passed between us, for each was sufficiently occupied with his own thoughts, till a wild moaning—the sure prelude of a storm—struck painfully upon our ears. The ancient pines, too, began to wave and creak, and a few drops of rain fell heavily, rattling among the foliage like hail-stones; then came a distant growling of thunder; and last of all a flash, which illuminated the woods far and wide, succeeded immediately by a burst so sharp and so loud as to resemble rather a platoon of musketry than any other sound in nature. It caused us both to start upon our legs; but though we looked round in the full expectation of perceiving some portion of the forest on

fire, we were deceived: the bolt had fallen harmlessly, and darkness again overspread the scene as with a curtain.

"That was an awful blaze, your honour," said my man; "the devil the likes of it did I ever see afore—and see, there's another!" And another, and another, sure enough there came; while the rain, which had hitherto fallen scantily, began to descend as if from buckets. In five minutes the screen of foliage was pierced; in half that space we were thoroughly saturated, while our poor horses stood trembling and snorting, as flash succeeded flash with a rapidity which set all calculation at defiance.

While the storm thus raged, I chanced, in search perhaps of a denser screen, though altogether unconsciously at the moment, to turn round. I had scarcely done so, when I beheld, by the light of the storm, an opening in the forest, at the extremity of which stood a house, surrounded, as it appeared to me, by a patch of cultivated ground. I immediately made my man aware of the discovery, who turned his eyes also in the same direction; and as we were not long left without light enough to direct our research, hope was soon converted into certainty. We were indeed near to some human dwelling; and the circumstances of our case were a great deal too pressing to permit any momentary hesitation as to the course which it behoved us to follow. Each untied his horse, and with halter in hand we began to move cautiously in the direction which promised to conduct us to a place of shelter. But we had not proceeded far, ere a new and more startling obstacle presented itself: we found that there was a deep ravine in front, while a roar of waters, heard at every pause in the sounding of the thunder, indicated that it was traversed by a river doubtless of no inconsiderable force. Still, when men are caught, as we then were, by bad weather in a dark night, even real dangers do not easily hold them back from exertion. After advancing, therefore, as far as it appeared prudent to do, amid a tangled underwood and down a steep descent, I gave my horse as well as his own to the care of the servant, and directing him to remain stationary, I set out alone, in the hope of discovering some means of passing the gulf.

Though I had no other light to guide my steps than that which the storm afforded, happily for me, the flashes continued still so frequent, that I experienced very little difficulty in continuing my progress. I reached the margin of the stream in safety, and found that though in dry weather it might be, and doubtless it was, a mere rivulet, the rains had already swollen it to a formidable torrent. Its channel, likewise, was rocky and precipitous; nevertheless, as if fate had determined to befriend me, I found that, not far from the spot on which I stood, it was traversed by a rude bridge. I made towards it, the lightning being my lamp; and committing myself on hands and knees to the protection of a good Providence, I crawled over the plank in security. All the rest was easy. Making the opposite bank, I found myself in an open field, having a log-house with some rude out-buildings clustered about it; and as the inmates were yet moving, my cries soon attracted their notice, and they hastened to render every assistance in their power. In a moment lights were glancing from their windows. The door was unclosed, and a man hurrying out with a torch in each hand, requested me to lead in the direction of the spot where I had left my horses. I took one of the flambeaus, and as the storm was by this time considerably abated, we had soon the satisfaction to ascertain that the shouts with which we strove to attract my servant's notice, were answered. Immediately my new acquaintance crossed the bridge, and in less than half an hour he, and the creatures to whose rescue he had hastened, arrived wet and weary, but uninjured, at what I may now be permitted to call my own side of the stream.

If the exertions of the stranger had been worthy of praise in thus delivering two way-worn travellers from the difficulties of their situation, his hospitality, now that danger was past, fully corresponded with them. He would not permit either master or man to think of their horses, but insisting that we should enter the house, where fire and changes of apparel awaited us, he himself led the jaded animals to a shed, rubbed them down, and provided them with forage. It would have been affectation of the worst kind to dispute his pleasure in this instance, so I readily sought the shelter of his roof, to which a comely dame bade me welcome, and busied herself in preventing my wishes. My drenched uniform was exchanged for a suit of my host's apparel; my servant was accommodated in the same manner, and we soon afterwards found ourselves seated beside a blazing fire of wood, by the light of which our hostess assiduously laid out a well-stocked supper table. I need not say that all this was in the highest degree comfortable. Yet I was not destined to sit down to supper without discovering still greater cause for wonder. In due time our host returned, and the first glance which I cast towards him, satisfied me that he was no stranger. The second set every thing like doubt at rest. Sergeant Champe stood before me, the same in complexion, in feature, though somewhat less thoughtful in the expression of his eye, as when he first joined my company in New York.

I cannot say that my sensations on recognising my ci-devant sergeant were altogether agreeable. The mysterious manner in which he both came and went, the success with which he had thrown a veil over his own movements, and the recollection that I was the guest of a man who probably entertained no sense of honour, either public or private, excited in me a vague and undefined alarm, which I found it impossible on the instant to conceal. I started, and the movement was not lost upon Champe. He examined my face closely; and a light appearing to burst in all at once upon his memory, he ran forward towards the spot where I sat.

"Welcome, welcome, Captain Cameron," said he, "a thousand times welcome to my roof; you behaved well to me while I was under your command, and deserve more of hospitality than I possess the power to offer; but what I do possess is very much at your service, and heartily glad am I that accident should have thus brought us toge-

ther again. You have doubtless looked upon me as a twofold traitor, and I cannot blame you if you have. Yet I should wish to stand well in your estimation, too; and therefore I will, if you please, give a faithful narrative of the causes which led both to my arrival in New York, and to my abandonment of the British army on the shores of the Chesapeake. But I will not enter upon the subject now. You are tired with your day's travel; you stand in need of food and rest. Eat and drink, I pray you, and sleep soundly; and to-morrow, if you are so disposed, I will try to put my own character straight in the estimation of the only British officer of whose good opinion I am covetous."

There was so much frankness and apparent sincerity in this, that I could not resist it, so I sat down to supper with a mind perfectly at ease; and having eaten heartily, I soon afterwards retired to rest, on a clean pallet, which was spread for me on the floor. Sleep was not slow in visiting my eyelids: nor did I awake until long after the sun had risen on the morrow, and the hardy and active settlers, to whose kindness I was indebted, had gone through a considerable portion of their day's labour.

I found my host next morning the same open, candid, and hospitable man that he had shown himself on first recognising me. He made no allusion, indeed, during breakfast, to what had fallen from him over night; but when he heard me talk of getting my horses ready, he begged to have a few minutes' conversation with me. His wife, for such my hostess was, immediately withdrew, under the pretext of attending to her household affairs, upon which he took a seat beside me, and began:—

"I trust you will believe me when I say, that nothing can be a matter of more perfect indifference to me than the estimation in which I may be held by the individuals composing Arnold's Legion; for the whole of whom, from their commanding officer downwards, I entertain the most sovereign contempt. But you are a Briton born. I found you to be an honourable and a right-minded man; and though I believe that you erred in drawing your sword against the liberties of America, I still respect you so much, that I would not willingly rank as a traitor in your eyes. I have therefore resolved to tell you a tale, which I should not think it worth while to tell to any other man, unless I knew him to be a genuine American in all his principles and feelings.

"You remember under what circumstances it was that I arrived at New York. I came to you as a deserter; bearing on my name the full load of obloquy which attaches to that character, and exposed to all the dangers which attend the career of one who has once betrayed a trust which he had sworn to hold sacred. Sir, I was no deserter. Mine was a deed—unusual, I allow, and most suspicious in its colouring; but performed not only with the sanction of General Washington, but at his positive desire. Listen, and I will tell you all.

"You will be at no loss to imagine that the discovery of Arnold's treason, accompanied as it was by the seizure of one of the partners in his crime, created a great sensation throughout our army. So deep, indeed, was the feeling of disquiet and distrust, that no man seemed to be aware on whom reliance might be placed; that no man would have ventured to become surety for the faith of his own brother. That the general shared in this uneasiness all ranks acknowledged, but the extent to which the feeling on his part was carried, remained a secret to all, till to me, and to me alone, it was communicated. I will tell you how this befel, at least how I myself came to be honoured with Washington's confidence.

"While Arnold and your commander in-chief were carrying on their infamous correspondence, our army, under the temporary orders of General Greene, occupied a position, as you doubtless recollect, in the vicinity of Tappan. Lee's Legion, of which I was the sergeant-major, held the outposts; and I think you will allow, that a corps better qualified to perform such service has rarely been embodied. Well, I had gone through the ordinary routine of my business; I had ascertained that the guards were planted—that the patroles were told off, and that the horses and accoutrements of the men not immediately on duty were in order; when, about nine o'clock one night, I received a message from Major Lee, that he desired to see me on particular business. I repaired to his quarters without delay, and found him evidently labouring under a considerable degree of excitement. He was walking up and down the apartment with a short and irregular step, and he no sooner caught the sound of my foot within the threshold, than he desired me, without stopping, to bolt the door. I did so, and then he turned towards me.

"'Champe,' said he, 'you scarcely need that I should tell you, that if there be a man in my legion, in whom, more than all the rest, I am disposed to place reliance, it is yourself. I have watched you ever since you joined the corps. I have found you uniformly brave, discreet, orderly, sagacious, full of ambition, yet of ambition of the most legitimate kind, and I know that you feel yourself to be on the high road to promotion. I am going to put all your good qualities to the test; and I ask from you no pledges to secrecy, because I am confident that none such are needed.'

"What reply could I make to such an address? I merely bowed, thanked my officer, and assured him, that whatever man could do for him, or for America, I would at least attempt.

"'Aye,' continued he, 'I knew all that. If I desire you to storm a battery of cannon, you will do it, even if you go alone. If I say to you that your country requires you to undergo all manner of hardships, you will endure them. But the business on which I am about to employ you is different from both of these. Champe, you must desert—you must go over to the enemy.'

"I started, as well I might, but before I could interpose a word, he went on—'Hear me out, and then say whether you are willing to accomplish the wishes of the commander-in-chief or not. For I tell you, in the outset, that I am but a medium of communication between Washington and yourself; and you know as well as I, that

Washington is incapable of requiring at any man's hands services which shall so much as appear to imply a dereliction of honour.'

"'You are aware, of course, of the distressing consequences of Arnold's treason—of the anxiety and misgivings which it has occasioned throughout the army; and of the peril into which it has brought the life of the English Major André. You cannot, however, know, till I inform you, how the general is affected by it. I have had with him to-day a long and deeply interesting interview, in which he showed me some letters from ——— and ——— of New York, both of whom represent the plot as widely extended, and both unite in accusing General ———, of all men living, of a participation in it. Now, Washington's confidence in General ——— has been heretofore unbounded. If any thing be due, moreover, to the universal consent of all ranks, General ——— deserves that confidence; yet so thoroughly has it been shaken by the treachery of Arnold, that he can no longer experience a moment's repose. This he told me with a flushed cheek, and a choking voice; and he added, that to clear up his doubts, it was necessary that some trusty person should pass to New York, should hold verbal intercourse with his informants, and sift the whole affair to the bottom. But he does not intend that the services of his agent shall end here. If Arnold could be seized and brought back to camp, not only might André's life be saved, but there would be effected such an example, as would for ever deter all American officers from playing, under any circumstances, the part of traitors. Having thus opened his plans, he did me again the honour to say, that he was sure I could find among my gallant fellows the very person of whose services he stood in need. I felt highly flattered by such an announcement, and I did not for one moment hesitate as to my answer. I accepted the proposal, and, Champe, I named you as the man. Are you ready to earn immortal honour for yourself and your fellow-soldiers, and to do the most important services to your country, by carrying through this delicate and hazardous scheme for your general?'

"You and I, captain, have not seen a great deal of one another, yet you will, perhaps, believe me when I say that there are not many men who hold bodily danger more lightly than the individual who now addresses you. Of ambition, likewise, I admit that I always had my share; I strove hard for a commission, and I was pretty sure that, on the first vacancy, I should get one. It was not, therefore, from any disinclination to face the hazards of the exploit that I felt reluctant to accede to this proposal. But the idea of desertion—of committing, or seeming to commit, an act which must necessarily throw down the whole fabric of an honourable name, which I had so long laboured to erect—that did, indeed, startle me. I thanked the major for the good opinion which he entertained of me—I repeated my readiness to attempt any thing which should not imply disgrace—but I begged respectfully to decline a service, the very first act in obedience to which must place me in a light the most distressing to my own feelings, and the most odious to others. I could not even feign to be a traitor. The major, however, had made up his mind that I, and I alone, should carry through this business. He pointed out that even desertion, perpetrated at the request of the general-in-chief, was not disgraceful—that if it did bring on the head of an individual temporary shame, the mind, capable of reflection, would not balance between the accomplishment of a great public good and the endurance of a slight personal evil; and that the cloud, however dark for the moment, would make the contrast the more striking, when the truth came to be disclosed, and a full burst of glory should follow. But I own to you that the argument which weighed most with me, was his appeal to my 'esprit du corps.' What will our comrades say, after this gallant exploit shall have been performed, when they come to be told, that it was proposed to one of their own number, and by him rejected? I could not hold out against this consideration—so I told the major, that, relying on his honour to see my fame vindicated in the event of any untoward accident befalling to myself, I would give myself up to his guidance, and obey such instructions as he might furnish. These were soon explained. I was directed to wait upon ——— and ——— with letters which were handed to me: I was cautioned not to let the one know that the other had any communication with our camp: and above all, I was told that no personal injury should be done to Arnold, inasmuch as it was his capture, not his life, that was sought. 'If, therefore,' continued the major, 'you find that you cannot seize him unhurt, do not seize him at all; and if the choice be between his escape and his slaughter, let him go. To kill him would give the enemy an excuse for alleging all sorts of falsehoods against us. But if you can bring him alive to head-quarters, so that he may be tried by a court-martial, and publicly executed, you will at once further the ends of justice on an atrocious traitor, and strike a salutary terror into the minds of his associates.'

"Being thus forewarned as to the course which it behoved me to follow, I proceeded to arrange with the major the best mode of carrying his device into operation. No written document could be given for the purpose of forwarding my progress beyond our lines, because such a procedure would unavoidably come to the enemy's knowledge, and defeat the whole project. Neither was it possible to remove out of the way any portion of the numerous posts and patroles that lay between the quarters of our cavalry and the neutral ground. There seemed nothing, therefore, but to dare the worst, and putting myself under the guidance of fortune, to act as if I really were a deserter from the cause which I had conscientiously espoused. All that Major Lee could undertake amounted to this—that in case my absence should be discovered before morning, he would delay pursuit as long as possible. This was the more important, because it would be necessary for me to take a tortuous course, and to proceed with extreme caution in the dark: yet even this depended so much on accident, that to effect it might lie beyond his reach. Nevertheless I had nothing better to rely upon; so setting our watches

together (and it was then near eleven o'clock), and receiving from him three guineas to defray immediate expenses, I went forth to undertake an enterprise in every sense more hazardous than any on which I had previously been employed.

"Having reached the camp, I proceeded without a moment's delay to roll up my cloak, to pack my valice, thrusting into it the orderly-book, and to strap both upon my horse; after which I buckled on my sword and mounted. I passed through the lines unnoticed; but had not proceeded half a mile beyond them, when a mounted patrol, advancing by a cross-road, observed me, and challenged. I made no reply—but plunging the rowels into my horse's flanks, I galloped forwards. The patrol did not follow far, yet I felt that my chances of concealment were over, and that not all the major's management could long hinder a pursuit from being instituted. I rode on, therefore, full of anxiety and alarm; for which, as the event proved, there was good reason. For the patrol which met me was composed of a party of Lee's regiment; and the captain of the day lost no time in reporting to Major Lee, in person, all that had befallen. I have since learned all that passed, so I can inform you of it.

"Lee had retired to bed as soon as I quitted him, and strove to sleep; but his efforts availed him nothing. A generous and high-minded soldier, he could not think of the dangers to which he had exposed a comrade without horror; and I may say, without vanity, that there was not a man in the legion whom he more respected than myself. He tossed about, therefore, restless and uncomfortable; and was conjuring up all sorts of direful images, when some one rapped loudly at his door, as if earnest for immediate admission. Lee's heart sank within him as he desired the applicant to enter—and when he heard the officer state, in a hurried and excited tone, that a dragoon had been met near the lines, who put spurs to his horse when challenged, and escaped—a conviction of the truth came fearfully over him. Yet he retained his self-possession—and desiring to protract the interval of pursuit as long as possible, he affected to be very sleepy, and instead of noticing the communication that had just been made, complained of being disturbed. The captain of the day now repeated his report in more pressing language than before, so that it became impossible to affect ignorance of his meaning. Another device was accordingly adopted. First, he began to put various questions—then he ridiculed the idea that any individual from the legion—a corps which, during the whole war, had lost but one man by desertion—would abandon his colours; and last of all, he desired the officer to return to camp, and by personal inspection of the horses to ascertain whether any were missing.

By such manœuvring as this a little time was gained,—but it was only a little; for scarce half an hour had elapsed from the period of my quitting the lines, when Major Lee received the report of the captain of the day. The officer of the day, moreover, in his eagerness to vindicate the honour of the legion, made quick work with his inspection,—and soon returned to announce, that the name of the traitor was ascertained. He asserted that I was the man,—and that I had gone off with my arms, accoutrements, necessaries, and even with the orderly-book of the regiment. Again was Lee's ingenuity taxed in order to spin out the interview. He would not believe that I had deserted. I was, probably, gone off on some excursion of pleasure,—a grave offence, doubtless, and subversive of all discipline,—yet not without its examples among the officers; and, entertaining as all did a high opinion of my honour, it would never do to act with such precipitation as to disgrace me in the eyes of my comrades. Still the matter ought to be looked to, and a party must be ordered for pursuit. This too was done,—and the major, desiring to inspect it in person, gave directions that it should muster in front of his quarters. The men came,—but the officer in command was not the individual whom he desired to employ. He had another service in view for him; he must, therefore, give up the charge to Cornet Middleton, a youth of a peculiarly humane temper, and hence more likely than most to deal gently with the fugitive, should he be overtaken. Ten minutes more were thus gained; at the conclusion of which Middleton made his appearance, when written instructions were handed to him, signed, as the custom of our army required, by the major himself. These required him to follow—as far as a regard to his own safety would permit—a deserter who was supposed to have gone off in the direction of Paulus' Hook; to bring him back alive that he might suffer in the presence of his comrades: but in the event of his offering resistance, or making any effort to escape after he should once be taken, to put him to death. The delivery of this,—the verbal hints and cautions which the major judged it right to throw out,—the injunctions to take care of the horse and arms if recovered, and to guard well against surprise, sufficed to carry them through five minutes more,—so that on the whole I had a full hour, or perhaps an hour and a quarter's start. But as if to counterbalance this very inadequate advantage, a shower of rain fell soon after I set out, just sufficient, and not more than sufficient, to make my horse leave a palpable track along the road. Now, as all our chargers were shod by the same farrier, and the shoes made after a peculiar pattern, a track once taken up could not, by those who were acquainted with it, be easily lost; and no set of fellows throughout the army knew better than Lee's dragoons how to track both friend and foe by their foot prints.

"Notwithstanding the conviction that the pursuers were already on my track, I was compelled, so soon as I shook off the patrol that had challenged, to resume a slow and cautious pace; not only because the whole country before me swarmed with bands of irregulars, but because I was every moment in danger of falling upon one or other of the posts which were established every night in front of the lines, and withdrawn in the morning.

"When day began to dawn, therefore, I was yet several miles to the north of Bergen, and almost as far, by what is called the near cut, from a bridge by which the Hackinsac is traversed.

A wide and open plain, moreover, was before me; and to crown all, there came down upon the morning air an indistinct clatter, as of horses moving at a brisk trot in the same direction with myself. I looked round; and sure enough, on the summit of an eminence which overhangs the Three Pigeons, I beheld a strong patrol of cavalry. There was no possibility of mistaking their design; so I plunged the spurs into my horse, and dashing forward, took, at a venture, the road to Bergen.

"I heard their shouts in pursuit, for scarce a half a mile divided us: and in a still morning sounds extend far. I guessed, too, that these troopers, to whom every foot of the country was familiar, would not neglect the near cut to the bridge, yet I trusted in my own ingenuity to baffle them still, and never for an instant lost courage. Bergen I gained before they could recover the sight of me, which an intervening wood had cut off, and judging that nothing could serve my purpose so well as to throw them off my trail, I rode down one paved street and up another without hesitation. This done, I changed my route, and instead' of keeping the road to Paulus' Hook, I turned my face westward, and made for the Hudson. Of what followed you are aware. My horse, my scabbard, and belt, fell into the hands of the pursuers; I myself escaped, and threw away my weapon only when I could no longer retain it in the water.

"Of my arrival in New York, and of what first befel me there, it is unnecessary that I should say more, than that being conducted into the presence of your commander-in-chief, I was by him closely examined touching the condition and temper of the army which I had abandoned. Perfectly secure in the persuasion that the circumstances under which I came would shield me from suspicion, I answered vaguely—for I could not endure the thought, even to myself, of doing otherwise—yet I contrived to make the general fancy that I had communicated to him highly important details, and that I was a person worthy of patronage. You know, perhaps, how he urged me to enlist in your service; and how I evaded the proposition by pleading the dangers to which I should be exposed, in case any accident should afterwards throw me into the hands of my countrymen. The fact, however, was, that my plans were not yet sufficiently matured to warrant my taking such a step. Neither would I venture to take it without the sanction of my own chief; with whom, unless Major Lee had been deceived, I knew that means of communication lay open. I accordingly held out against his entreaties, and withdrew to the quarters which were assigned me. But I had other business in hand, and to that I gave my earnest attention. I waited upon Washington's agents. I found them in every respect such as they had been represented to be; and I opened out to each exactly that portion of my scheme which I knew that he would be both able and willing to forward. Through one I obtained full and accurate information on the subject of the supposed treason of General ——, and great was my satisfaction at being able to report that the calumny had no foundation in truth. With the other I deliberated respecting the best means of securing Arnold. Yet I do not deny that when intelligence reached me, that André's fate was fixed—that he had himself, by his manly declaration, defeated Washington's device for protracting the trial—that the consequence was his condemnation, and within twenty-four hours his execution—one strong motive of exertion in the capture of Arnold died away. Nevertheless, the letters which I received from camp urged me to go on: and as I obtained, through the same channel, permission even to join the British army, should other measures fail to accomplish my purpose, I no longer hesitated to close with Sir Henry Clinton's proposal. I accepted the rank of serjeant in Arnold's legion of traitors, and became domesticated, as you know, in Arnold's family.

"If I were to attempt to make you feel any portion of the excitement under which I laboured during the period of my sojourn in New York, I should utterly waste my labour. My communications with the spies were necessarily frequent; yet they were carried on with a degree of secrecy and caution which not only prevented your people from obtaining any suspicion of them, but kept each man from coming to the knowledge that the other was in my confidence. Of the political and military information which I forwarded to General Washington, it is needless to say much: it was so complete, that there scarcely occurred a conversation over Clinton's dining-table—there never arrived nor departed a ship, a regiment, or an individual—there was never formed a plan, nor a plan abandoned—of which I did not contrive to obtain an accurate report, and to transmit it to head-quarters. But it was the project for seizing Arnold which most deeply engaged my attention. Several schemes were brought forward and rejected for that purpose; till at last the following, which but for an accident must have succeeded, was matured.

"The house in which Arnold dwelt was situated, as you doubtless recollect, in one of the principal streets of the city, while its garden extended on one side, along an obscure lane, from which it was separated by a close wooden rail-fence. I found that every night before going to bed, Arnold was in the habit of visiting that garden, and I immediately resolved what to do. Working after dark, I undid a portion of the fence, and placing it up again so nicely, that no cursory examination would have sufficed to detect the spot where the breach had been made, I warned my associate that he should provide a boat in the Hudson, manned by rowers in whom he could trust; I then furnished myself with a gag, and appointed a night when my confederate should be admitted within the garden, so that we might together seize and secure our prey. Every thing was done as I wished. Major Lee was informed of the state of our preparations, and directed to come down with spare horses and an escort, to a spot on the river which I named. How often have I regretted since, that I should have set thus deliberately about the business! By heavens there occurred twenty opportunities, of which, had I been less anxious to accomplish my purpose, I might have

availed myself. But I permitted them to pass, or rather, felt myself unable to take advantage of them, because I had judged it imprudent to keep less trusty agents too often on the alert. So, however, it was to be.

"Time passed; and now, a few hours only intervened between the final adjustment of the details of our project and its accomplishment. Lee was on the stir, ——— was willing to hazard all; the boat's crew was provided, and their station pointed out.

"It was our purpose to seize Arnold unawares, to thrust the gag into his mouth, and placing each of us an arm within that of our prisoner, to hurry him through the least frequented of the streets towards the quay. We were to represent him as a drunken soldier, whom we were conveying to his quarters, should any person meet or question us;—and by G—, the deed was done. But the traitor's star prevailed. That very morning, an order was issued for the immediate embarkation of the legion, and I was hurried on board of ship without having had time so much as to warn Major Lee that the whole arrangement was blown up.

"I have told my tale; for all that remains for me to state, you can easily guess. Disappointed, mortified, not absolutely free from apprehensions on the score of personal safety, I must have appeared to you, when we first became acquainted, an exceedingly ill-conditioned fellow. But you will do me the justice to remember, that time wrought his customary healing effects with my temper, and that long before we landed in Virginia, I was myself again. Of course, you know that I deserted from you. No power on earth would have ever induced me to lift a hand against my countrymen—of that I was quite determined—yet I judged it wise to take the earliest opportunity of escaping; and I did so. My progress through the upper part of Virginia and a portion of North Carolina was exceedingly hazardous; for independently of the risk of capture which I ran from straggling parties of your troops, I felt that even among my own people I was not safe. Nevertheless I regained our army uninjured soon after it had passed the Congaree, and at once hastened to the position of my own corps. There my reception was of the most gratifying kind. Lee, now a lieutenant-colonel, caused the legion to muster, and stated publicly under what orders I had acted. General Greene, likewise, treated me very kindly, and sent me forward to Washington, from whom I received much more both of praise and recompense, than my unaccomplished services merited. But he would not permit me to continue in the army. He reminded me, that to be taken by the enemy would be followed by certain death; and presenting me with my discharge, accompanied the act by a donation so munificent, that I have never since known what it is to be in want. The winding up of all, is—that I married a wife, sat myself down in this beautiful district, and have been so fortunate as to give shelter in his hour of need, to an officer under whom I served only long enough to be taught that even the British uniform can cover a manly and a generous heart."

Such was the deserter's story. I heard it to an end with much interest, assured him that he should no longer hold a mean place in my estimation, and having thanked both him and his partner for their kindness, resumed my journey.

From the Drawing-Room Scrap Book.

ETTY'S ROVER.

Thou lovely and thou happy child,
Ah, how I envy thee!
I should be glad to change our state,
If such a change might be.

And yet it is a lingering joy
To watch a thing so fair,
To think that in our weary life
Such pleasant moments are.

A little monarch thou art there,
And of a fairy realm,
Without a foe to overthrow,
A care to overwhelm.

Thy world is in thy own glad will,
And in each fresh delight,
And in thy unused heart, which makes
Its own, its golden light.

With no misgivings in thy past,
Thy future with no fear:
The present circles thee around,
An angel's atmosphere.

How little is the happiness
That will content a child—
A favourite dog, a sunny fruit,
A blossom growing wild.

A word will fill the little heart
With pleasure and with pride;
It is a harsh, a cruel thing,
That such can be denied.

And yet how many weary hours
Those joyous creatures know;
How much of sorrow and restraint
They to their elders owe!

How much they suffer from our faults:
How much from our mistakes;
How often, too, mistaken zeal
An infant's misery makes!

We over-rule and over-teach,
We curb and we confine,
And put the heart to school too soon,
To learn our narrow line.

No, only taught by love to love,
Seems childhood's natural task;
Affection, gentleness, and hope,
Are all its brief years ask.

Enjoy thy happiness, sweet child,
With careless heart and eye;
Enjoy those few bright hours which now,
E'en now, are hurrying by:

And let the gazer on thy face
Grow glad with watching thee,
And better, kinder;—such at least
Its influence on me.

From the Asiatic Magazine.

AMERICAN INTERCOURSE WITH CHINA.

In one of the volumes of the Diplomatic Correspondence of the United States, lately published by order of Congress,* is a letter from Mr. Samuel Shaw to Mr. Jay, giving an account of the first visit of an American trader to Canton, which sailed from New York on the 22d February 1784, and arrived at Canton in October.

"The day of our arrival at Canton," says the writer, "and the two following days, we were visited by the Chinese merchants, and the chiefs and gentlemen of the several European establishments, and treated by them in all respects as a free and independent nation. As such, during our stay, we were universally considered. The Chinese themselves were very indulgent towards us, though ours being the first American ship that had ever visited China, it was some time before they could fully comprehend the distinction between Englishmen and us. They styled us *the new people*, and when by the map we conveyed to them an idea of the extent of our country, with its present and increasing population, they were highly pleased at the prospect of so considerable a market for the productions of theirs."

The writer then adverts to the affair of the English gunner, who was given up to the Chinese authorities. His account is as follows:—

"On the 25th November (1784), an English ship, in saluting some company who had dined on board, killed a Chinese and wounded two others, in the mandarin's boat alongside. It is a maxim of the Chinese law, that blood must answer for blood; in pursuance of which they demanded the unfortunate gunner. To give up this poor man was to consign him to certain death. Humanity pleaded powerfully against the measure. After repeated conferences between the English and the Chinese, the latter declared themselves satisfied, and the affair was supposed to be entirely settled. Notwithstanding this, on the morning after the last conference (the 27th), the supercargo of the ship was seized while attending his business, thrown into a sedan chair, hurried into the city, and committed to prison. Such an outrage on personal liberty spread a general alarm, and the Europeans unanimously agreed to send for their boats, with armed men, from the shipping, for security of themselves and their property, until the matter could be brought to a conclusion. The boats accordingly came, and ours among the number; one of which was fired on and a man wounded. All trade was stopped, and the Chinese men-of-war drawn up opposite the factories. The Europeans demanded the restoration of Mr. Smith, which the Chinese refused till the gunner should be given up. In the meanwhile, the troops of the province were collecting in the neighbourhood of Canton; the Chinese servants were ordered by the magistrates to leave the factories; the gates of the suburbs were shut; all intercourse was at an end; the naval force was increased; many troops were embarked in boats ready for landing, and every thing wore the appearance of war. To what extremities matters might have been carried, had not a negotiation taken place, no one can say. The Chinese asked a conference with all the nations except the English. A deputation, in which I was included for America, met the *fuen* (foo-yuen), who is head magistrate at Canton, with the principal officers of the province. After setting forth, by an interpreter, the power of the emperor, and his own determination to support the laws, he demanded that the gunner should be given up within three days; declaring that he should have an impartial examination before their tribunal, and if it appeared that the affair was accidental, he should be released unhurt. In the meantime, he gave permission for the trade, excepting that of the English, to go on as usual; and dismissed us with a present of two pieces of silk to each, as a mark of his friendly disposition. The other nations, one after another, sent away their boats, under protection of a Chinese flag, and pursued their business as before. The English were obliged to submit; the gunner was given up; Mr. Smith was released, and the English, *after being forced to ask pardon of the magistracy of Canton, in the presence of the other nations*, had their commerce restored. On this occasion, I am happy that we were the last who sent off our boat, which was not disgraced by a Chinese flag; nor did she go until the English themselves thanked us for our concurrence with them, and advised to the sending her away. After peace was restored, the chief and four English gentlemen visited the several nations, among whom we were included, and thanked them for their assistance during the troubles. The gunner remained with the Chinese—his fate undetermined."

It is well known that the unfortunate individual was put to death. The statement of this affair by Mr. Shaw seems correct, except so far as relates to the English asking pardon of the magistrates of Canton, which appears to be an embellishment.

Whilst upon this subject, we may take notice of some remarks in the *North American Review* for October 1834, on a statement made in the *Quarterly Review*, highly derogatory to the American traders, in the affair of Terranova, the sailor who was given up by them to the Chinese.

"From the moment that our violation of the Chinese law is of such a nature," says the writer in the *Quarterly Review*, "as to drive the Chinese government to the extreme measure of *seizing* the persons of the offending parties, the die is cast, and we fear that hostilities will become inevitable. The last instance of the kind that occurred was in 1784, when one of the supercargoes of a private ship was *seized*, to answer for homicide, and subsequently, after a good deal of blustering, and preparations for commencing hostilities, was redeemed by the surrender of another individual, equally innocent though of an humbler station. Much as we regret the probability of a rupture with the Chinese, we fervently hope that we may never see it averted by such another disgraceful compromise, which has only for its parallel one made by the Americans, a very few years ago, when an innocent Italian was given up to be strangled, *to save the life (it has never been denied) of a guilty American.*"

The American reviewer remarks upon this as follows:—

"How the learned writer knows that this statement has 'never been denied,' we are unable to say. We suppose he means, that it has never been denied in his hearing. We will not undertake now positively to deny it; but we are informed, on what we deem the best authority, that the statement in the *Quarterly Review* is wholly incorrect, and that the Italian *taken out of an American ship*, fourteen or fifteen years ago, by the Chinese authorities, was unquestionably the [redacted]r of the homicide for which (under the Chinese law) [redacted] suffered. Whether, as was stated on his behalf, the homicide was purely accidental, we do not know; and supposing it to have been so, heaven forbid we should justify his execution under the Chinese law. But as a question in the law of nations and casuistry, it would bear an ar[redacted]ent,

* New York, 1833.

whether the United States could *rightfully* go to war against the Chinese, for administering their own laws on persons voluntarily coming within their jurisdiction. The Quarterly Reviewer seems to lean to the affirmative of that question."

The American writer appears to us to have the best of the argument in this case. So far from the innocence of the Italian and the guilt of another person being admitted facts, we have only seen them once suggested. Captain Coffin, in his evidence before the commons' committee, states that he arrived at Canton from five to eight months after the transaction, and had the particulars of it from the supercargo of the ship, which was the *Emily* of Baltimore, and heard them frequently stated by others on the spot. "I understood," he says, "that the woman that was killed or drowned, was in a boat under the ship's bows, and something passing between the sailor and the woman, he took an earthen jar and threw it at her, and struck the woman on the side of the head; consequently, she fell overboard, and when she was taken up, she was dead. At the time, it might have been settled for a trifling amount of 100 or 200 dollars; but after getting to the ears of the mandarins, they demanded life for life. It was thought by the Americans there, that the sailor did not intend to kill the woman; whether it was done in sport or anger they could not tell, but they agreed that the man should not be given up: consequently, for some time, the American trade was stopped, and the mandarins persisted in demanding the man. I believe that it is not doubted that the man struck the woman; but the matter was never properly investigated."

Several printed statements of the transaction tally with the above. A different version of it, however, was given before the same committee by the late Mr. C. Marjoribanks.

"Upon an important occasion," he observes, in reply to a question as to the control of the American consul at Canton, "which was in 1821, when a seaman belonging to one of their ships was accused of homicide, and where, *from every enquiry that was made, the man, I believe, was entirely innocent of the crime imputed to him*, the Chinese, as usual, demanded that he should be given up. The consul, who was a man of much good feeling, resisted that demand; but his countrymen, and the persons connected with the trade, and the captains of the ships, formed themselves into a combination, as it were, against the consul, and resisted his wishes. The seaman, who was a Sicilian by birth, was surrendered into the hands of the Chinese. I believe this association of the Americans so far sheltered themselves under the plea that he was not a citizen of the United States, and that they were not compelled to protect him. He was surrendered to the Chinese government, strongly against the private individual remonstrances of members of the British factory: the select committee, as a public body, was not called upon to interfere in it. The unfortunate man, when delivered up to the Chinese, underwent a mere sham trial. He scarcely spoke English; nobody but Chinese interpreters were present; his hand was covered with ink, and he ignorantly placed the impression of it upon paper, which was a confession of his guilt. It was expected, as in other cases of homicide, the sentence would be referred to the emperor for his sanction: instead of that, the seaman, without any intimation, was carried to the place of public execution, three days afterwards, and strangled. I believe the American character, in the estimation even of the Chinese, was very considerably lowered by that act. The American consul, who had thus proved the inefficiency of his power, was so disgusted with the proceedings of his countrymen, that he immediately resigned his situation."

Captain Coffin, being asked whether the consul (Mr. Wilcox) resigned his appointment in consequence of this affair, replied that he never heard that that was the case; that Mr. Wilcox was consul when he arrived at Canton (about half a year after); that his consulship was a great plague to him, in his other business, which was large, as he took no fees; but that it was a full year after the occurrence that he resigned.

GRAY'S ELEGY ILLUSTRATED.

The continuous and harmonious succession of images, consisting mostly of simple natural scenes, that are presented to the fancy in Gray's Elegy, render it an admirable theme for illustration. No poem more vividly illustrates itself in the mind of the reader. The poet paints ideal pictures with exquisite delicacy, by a few strokes of the pen: you not only behold the scene, but feel its influence.

Mr. John Martin—not the artist, but the bibliographer—has got up in a very neat manner an octavo edition of the *Elegy written in a Country Churchyard*, with illustrations, one to each stanza, by some of the most eminent artists, engraved on wood in an elaborate and finished style of execution. We wish that the ideas had been made the measure of the quantity of embellishment, instead of the number of verses; for some stanzas suggest two or three pictures, while others—at least one or two—might have been better left without any.

The landscapes are by far the best, and they form the most considerable portion of the illustrations. They are of the homely, pastoral kind, that the poet had in his eye when he composed the Elegy. Evening, by Barrett—Morning, by Dewint—Sunrise, by Stanley—the Ivied Tower, by Constable—the Churchyard, by Charles Landseer—the Funeral, by Collins—and the lonely Tomb, by Hart—are perfect gems of art. The designs in which the figures are more prominent are not always satisfactory. Boxall's graceful group of a mother and her children exemplifies maternal tenderness rather than "the short and simple annals of the poor." The air and attitude of Mulready's young author waiting in the hall of his proud patron, is rather characteristic of a lounging idler, than of one on whose cheek we should see "the blushes of ingenuous shame." This artist, too, appears to have misinterpreted the meaning of the expression "the *little* tyrant," or he would hardly have represented the "village Hampden," in the person of a rustic schoolboy threatening another for breaking a child's toy. The lusty labourer digging does not convey the idea of "chill penury," as Frank Howard intended; and his attempt at embodying the first line of the epitaph, "Here rests his head upon the lap of earth," by a figure in black, like Hamlet, lying on the ground, is a *literal* mistake indeed. These, however, are the only prominent misconceptions in the series of thirty-two designs.

The wood engravings possess the great merit of preserving the character of the artist's style, and the feeling of the picture, as far as we can judge by the natural effects.

From the New Monthly Magazine.

BUBBLES FROM BRUSSELS,

WITH A PUFF FROM CALAIS "EN ROUTE." BY AN OLD LADY.*

"Would you forget the dark world we are in, only taste of the *bubble*."—*Moore.*

It was on the last day of July that I again seated myself in my elbow chair, after "my trip to the continent," (it is thus I always speak of my brief visit to Boulogne-sur-Mer), and having despatched the "Bubbles" which were its literary result, to Mr. Henry Colburn, I awaited his reply with an anxiety natural to one who for the first time ran a risk of being *published!*

On the following day I received a letter, written in a most business-like hand; I put on my spectacles, and then ascertained beyond a doubt that my "Bubbles" had produced a sum of money which not only sufficed to pay the expenses of my trip,-but actually left a surplus sufficient to enable me to purchase a muff and tippet for winter's wear. I felt myself at once a literary character—a regular Trollope; and I longed, like that lady, to go tripping again, making (and at the same time *earning*) *more notes*. And why not do it, thought I to myself? Summer is certainly past, but do not all travellers rave about the tints of autumn? It is but the 3d of September, and in three days I'll be off.

So again I packed up my two trunks and my bandbox, and left London in an early Dover coach. On British ground I of course profess to blow no bubbles, nor will I trouble the reader with the troubled waters I met with in my progress to the French coast; I proceed at once to the landing-place, and put my foot upon the ladder.

A disembarkation at Calais is very dissimilar to that which I have attempted to describe at Boulogne. No beauty, no fashion attended to witness my arrival; the appearance of all about me was thoroughly business-like, and though the emissaries of the different hotels did certainly rather vociferously announce their respective claims, and one in particular did (as Henry Lytton Bulwer says) "nearly scratch my nose with M. Meurice's card," still I must candidly acknowledge that when I first stepped upon the pier at Calais, I encountered less annoyance than might have been my lot on arriving per coach at the Gloucester Coffee-house, Piccadilly.

Never did I see so *triste* a place as Calais. There were many well-dressed men about the streets, who had evidently seen better, and far more agreeable, days: they had about them a London look, but their raiment was seedy, and their countenances sad.

The Grande Place seems to be the general resort of these forlorn ones; there they loitered and lounged, and smoked, and yawned, and read papers, and talked, and longed for the hours to pass, though every hour was like its predecessor, and each new day a counterpart of that which went before it. I was told that at the play I should be sure to see all the *elite* of the place, so at seven o'clock I seated myself in the very small, but neat theatre. There was a good house, and being near a person who knew "*who was who*," I made a few enquiries, the answers to which were enough to make an elderly body like myself wish that the earth would open and swallow her. For instance:—

"That is a handsome woman in the stage-box, who is she?"

"Oh! the celebrated Mrs. Pokey, who was, you know, divorced from her husband some years ago."

"Indeed! and that gentleman who is talking to her?"

"That is Colonel Finch, who lives with her *at present*."

"Hem! Who is that pretty girl in blue, in the dress circle?"

"The *cher ami* of that French officer."

"Oh!" said I, *pretending* not to mean the person I first pointed out, "the one in the centre box?"

"I beg your pardon;—*that* is the notorious Lady Blank, who"——

I had heard quite enough of Lady Blank, and therefore hastily turned the conversation, determining at the same time to ask no more questions.

The next morning I got into the Lille diligence, and set off on my journey towards Brussels. Now some few of my English readers may possibly not know what a French diligence is like; I will endeavour to describe it. It is as *unlike* an English light safety-coach, licensed to carry four inside, as possible. I may be wrong, and, if so, I am open to conviction; but I do conscientiously declare, that I believe the diligence in which I left Calais, was licensed to carry nineteen people, *not* including the *conducteur*. It was a huge building, consisting internally of three apartments: the front division held three people, and here most fortunately I obtained a seat; in the centre of the vehicle was a large apartment holding six, and behind that again an inferior chamber, in which were stowed away six more living beings. Thus fifteen were imprisoned within the bowels of the machine; the others were on the roof, with a prodigious quantity of luggage, and when at last the lumbering vehicle was set in motion, the noise that it made exceeded all description.

By my side sat a fat Englishwoman with her maid, who said she was going to Brussels to stay with a married sister. I never discovered the exact quality of my companion; but from her conversation I decided that she was something very low, aspiring amongst strangers to appear something particularly high.

"For my part," said she, "these public vehicles will be the death of me; but posting alone, without a smattering of the lingo of the place, is very ill convenient."

This I readily admitted; but added, that "lumbering and tedious as the diligences certainly were, the pleasure of traveling amply repaid me for entering them."

* This and a previous article in the New Monthly Magazine, too long to be amusing, will readily be recognised as burlesques upon Mrs. Trollope's "Belgium," &c.—*Ed. Museum.*

"Ay; so people says," she replied, "but for me, and the like, who has one's comforts at home, these numble-cumtumbles won't do; but traveling's all the fashion now, and that's one reason I'm come. What sweet books they writes on the subject! pray, ma'am, have you seen the 'Diarrhyar of an Invalid?' that's quite the true thing, I assures ye; I shouldn't wonder, ma'am, if you were to make your little reminiscences, and all I begs is, that you won't go and put *me* into your book."

I of course expressed my surprise that she should suppose an old woman like me had any idea of printing my tour; and as to putting *her*, or any other individual into my book, the very suspicion was an insult.

The fortified towns in France and Belgium quite astonished me; every town of consequence was a fortified town, and we penetrated gateways, traversed ramparts, and crossed draw-bridges, until they became as familiar to me as milestones and turnpike-gates.

At Gravelines, an exceedingly prettily situated town, we passed sentry-boxes, great guns, and fortifications; and rattled over the loose boards of bridges until I began to fancy myself in a besieged city; and here commenced the rigid examination of my passport.

Nothing can be more annoying than this scrutiny at the end of every half-dozen or dozen miles; I was sure to have mislaid my little important document, and in my confused search after it, I was always considering what would be the consequence if in the end it was not forthcoming. Dunkerque was our next resting-place; a handsome, clean, busy town, where I am told they manufacture most excellent gin. From thence we journeyed along a lovely road, partly on the banks of a canal, and then between avenues of fine trees, until we arrived at Cassel; and now I am truly at a loss to give any idea of the loveliness of that spot on a bright summer's day. It is built upon a hill, and the view equals, if not exceeds, any inland prospect that I am acquainted within our own little island.

I will not compare it with Richmond, for there is no river; but the view from the Malvern hills is not to be named with it. Near this place is a monastery of La Trappe, which I made up my mind to visit; but having discovered that I had no chance of gaining admittance, unless, like Rosalind,

> "I did suit me all points like a man;"

and *this* not exactly suiting an old lady's prejudices, I gave up the point.

Tournay is a very fine fortified town, and Ath scarcely less formidable. Lille, celebrated for its manufactures, is a large, cheerful, dirty, Bristol-like city; but its merchandise being silken sheen, and not rums and sugars, the shop-windows are particularly gay, full of shawls and scarfs, silks and satins.

At length we arrived at Brussels, and established ourselves, not at the nominally first hotel, the Belle Vue, but at the Hotel de l'Europe, its opposite neighbour in the Place Royale.

I never saw a more deserted looking place, (it is in the month of September that I write.) London, at the same period, when no one that you meet acknowledges that he intends remaining four-and-twenty hours, can scarcely be more desolate!

What adds immensely to the sombre appearance of Brussels in the summer, is the near approximation of ruins to its most splendid palaces, and most cheerful haunts. The royal palace is beautiful, and next door to it is the *late* palace of Count Crockenberg, in a state of ruination; it having been knocked about his ears at the period of the revolution. The park, formerly surrounded with gilded rails, is now hurdled in, like an extensive piggery; and though all this uproar and mutilation happened three years ago, not one blemish has been as yet repaired!

Many English families have left the town since that period of commotion, and we cannot wonder at their flight, as some friends of mine, who lived in the centre of the most disturbed quarter, had their marble chimney-piece forced by a cannon-ball into the centre of their drawing-room, and they lived upon hashed mutton, cooked in the garret, during the whole disturbance.

Those who delight in giving Boulogne a bad name, call her the refuge for the destitute; but there appeared to me to be more notoriously bad English at Brussels: it seemed, indeed, to be the last refuge of the infamous on a grand scale. These notorious personages would find Boulogne much too quiet a place for them; and not having a chance of admission into good society, they would have no public amusement to occupy their time. Boulogne has indeed her club, where, as I walked up the Grande Rue in summer time, I heard laughter and billiard balls, and saw men sitting without their coats, with the backs out of the drawing-room windows. But this club is, I believe, a harmless sort of tittle-tattle place, where an old lady like myself might pass away an hour talking over the demerits of her neighbours, without seeing any thing to shock her eyes. Up stairs, three stories high, I believe, they have a little snug play; but on the drawing-room floor, billiards, newspapers, and gossip, form the indulgences of the subscribers. Now, this would never do for the notorious absentees of Brussels; something more exciting is required by these well-whiskered, honourable gentlemen.

I have before observed, that I have only seen Brussels *out of season;* and the new town consequently looked like a desert: of the old town, I can, however, give a different account; it is full of pretty shops, and exhibited sufficient bustle and animation.

Some *distinguée* women were to be seen, but very few smart men. The men, indeed, appeared to be strangers in what *they* called "traveling dresses," blue blouses and cloth caps; looking more like butchers' boys than gentlemen. Oh for the old school! (an old lady may be pardoned the exclamation.)—Oh for the days when a gentleman could be distinguished at a glance from a barber's 'prentice!—Oh for the days of embroidery and ruffles! Alas! revolutions came, (in dress, as well as graver matters,) and then people left off their *ruffles*, and took to *cuffs!*"

To Waterloo, of course, I went; and the guide

as usual picked up from among the rubbish the bullet he had yesterday buried there: the crop of bullets is inexhaustible.

But it is of *bubbles*, not of *bullets*, that I write; and though I might expatiate by the hour together respecting persons and things beyond my comprehension, yet there would be no novelty to the reader, so many travellers have trod the same path, and done the same thing.

I know very little about pictures, and therefore I have never alluded to the various collections which (though in ignorance) I enjoyed at Brussels and at Antwerp. But at the table d'hote at the latter place, I met my old companion of the diligence, who talked to me with much animation about the *shay drivers* of Ruby's, and the specimens of Dominie Sampsons. But autumnal breezes began to roar very like the winds of winter, and the leaves were rapidly falling from the trees: it therefore became necessary for me at once to pack up the two trunks and the bandbox, and hasten homewards, or else to take a lodging and tarry the winter at Brussels. I soon seated myself again in the diligence, once more made my appearance at the long table at Roberts's hotel at Calais, and after bubbling rather uneasily across the channel, I landed at Dover, and advanced by easy stages to London. Next summer my bubbles from the crater of Vesuvius will astonish every body. At present I am comfortably established by my own fire-side, and wish during the winter months to think of no bubbles but those which emanate from the *tea urn*.

From the Asiatic Journal.

THE ANGLO-INDIAN THEATRE.

At present the civil and military servants are the artificers of their own dramatic amusement, and I question whether much would be gained by having it sent out ready-made. What a delightful bustle, what a stir of preparation, in getting up an amateur play! What shifts and contrivances to supply defects! what laughable disputes for the chief characters! what perplexities in casting the female parts and drilling them to feminine postures, and what exquisite farce to hear them, in their half-caste accent, mimicking the affected mince lisp of a lady of fashion! The green-room anecdotes of the Madras theatre would make an entertaining volume. It was, perhaps, the happiest model of a summer theatre that was ever constructed, and from the universality of its uses, probably (for I could never discover a more rational etymology),—being at one time an assembly-room, at another a place for holding masonic lodges, and at others for a general meeting of the settlement,—received the name of *Pantheon*. However, it was a handsome building, and capable of holding, pit, boxes, and gallery, nearly seven hundred persons. When there was a ball, a temporary flooring was thrown over the pit, and it served the purpose of a spacious ball-room. The amusing periods of its history, like the amusing periods of every thing else in India, are now departed. The reductions of salary in both services, conjoined with other causes, have thrown a gloom over the innocent and cheerful diversions that, in my time, enlivened the place, and gave a life and spirit to those humble theatrical experiments, which will long live in my memory. Mark Rowarth, the *arbiter elegantiarum* of the settlement, was the manager, with a liberal stipend, of the Madras theatre. His company was recruited by young military men, by even a [illegible] dimensions to avoid the characters, he had a regular school [illegible] *Bravo! white apron!*" or European half-castes, whom he contrive[illegible] met draughts whiten into something of female semblance. [illegible] and ex-

But Colonel Elisha Trapaud!—Oh that, for one moment, I held the pen of Scarron, to paint the *Roman Comique* of which poor Trapaud,—usually termed in unkind derision Colonel *Crapaud*,—was the *Ragotin*. He had all the theatrical irritabilities of that entertaining personage, and, by coaxing his vanity, might be prevailed upon to undertake any part, however unsuited to his figure and person, which were almost caricatures of humanity. Reader, if you had that exquisite work of the most delightful of French authors on your table, I might be spared the trouble of sketching this most exact counterpart of him. But imagine a figure, somewhat diminutive, yet protruding into all sorts of ungraceful angles, the whole outline being a kind of rhomboid:—imagine this figure, at the advanced age of fifty or fifty-five, surmounted with a youthful wig, luxuriant with curls, and haunted with the happy consciousness of his personal perfections, and no very limited notions of his intellectual ones, for he was the *Admirable Crichton* of his own fancy. But, with all his conceit, he was a useful actor, and though it was the fashion to laugh at him the moment he appeared on the stage, he set it down as the effect of some comic hit, that pleased the audience, without dreaming that he himself was the subject of it. Upon one occasion, a wag, willing to amuse himself at his expense, actually persuaded him to write a comedy, and, unluckily, he set about in good earnest. Being an efficient member of Mark Rowarth's dramatic corps, Mark could not refuse to act it, when it was completed. Such a farrago of dulness and absurdity was never exhibited before, but he was proud of it, and took great pains in getting it up. The performers, to do them justice, did all they could for it; for Trapaud's vanities and irritabilities were harmless and amusing, and there was no wish to give him offence. But, as for persuading him that the piece would not do, it was out of the question. He would have seized by the throat any body, whoever he might be, that ventured to threw out the slightest criticism upon its faults.

To this comedy, which he called the *Merchant of Smyrna*, he wrote a prologue, and insisted upon Mark Rowarth speaking it. The critic of the *Madras Gazette*, the next morning, observed of it, that "it abounded in undisputed truths and incontrovertible propositions:" a criticism (such is the omnivorous nature of vanity) which gave the colonel great satisfaction, for he was as proof against the shafts of ridicule or irony, as an alligator to a musket-ball. A line or two of it, I shall never forget. It began thus—and the house was in a roar, whilst Rowarth, with as much seriousness as he could force into his countenance, delivered or rather attempted to deliver it:—

> "To-night, my gentle friends, we act a play—
> Approve it or condemn it, as you may.
> In Thespis' days, a wagon was the stage—
> But larger theatres adorn our age.
> In Drury's pile assembled hundreds sit,
> Judges of taste and arbiters of wit.
> But we ———

I forget how it went on, but it was a most egregious specimen of nonsense—and excited, of course, thunders of mock applause. By dint, however, of cutting and slashing, this performer forgetting his part, and another substituting some equivocal nonsense of his own, it arrived at its termination; the poor author, all the while, swearing and stamping with rage at their spoiling his piece. But when it was over, there arose, by a preconcerted understanding amongst persons in different parts of the theatre, a call of "Author! author!" and a crown

" Ay; so people [illegible] Old me, and the [illegible] reluc- these [illegible] erformers. [illegible] head with- [illegible] pporters dashed [illegible] oke, however, was [illegible] had been made of [illegible] the thorny part scratch- [illegible], so that it streamed with [illegible] stage, swearing destruction to [illegible] sult.

[illegible] get,—for these are not unpleasing re- [illegible] e getting up of *Macbeth*, and to say the tru[illegible] got up most respectably, and Matthew Lock[illegible] usic was admirably performed, under the superintendence of Topping, who was an excellent musician. Lady Macbeth was undertaken by Anstey, son of the celebrated author of the *Bath Guide*. Every body knows how rapidly the beard grows in a hot climate. Anstey's was of the blackest tint, and it being a warm season of the year, before the fourth act it had grown so long, as to render it actually necessary for Lady Macbeth to shave before she appeared in the fifth. It was, however, so sultry behind the scenes, and there was so little air in the room appropriated to dressing, that Anstey ordered a table with a looking-glass and his shaving apparatus to be placed on the stage, where there was a stronger current. In malicious pleasantry, some one rang the prompter's bell, which was the constant signal for drawing up the curtain. It was most promptly obeyed, and, to the amazement of the whole assembled fashion of Madras, Tom Anstey was exhibited in the costume of Lady Macbeth, in that most unfeminine part of his toilette. The roar, the screams of sur rise and merriment that ensued, are beyond description.

But anecdotes of the Anglo-Indian stage are rushing fast on my recollection,—and may probably be continued in a future number.

LONDON THEATRICALS.

Reeve has come out in a new character at the Adelphi, in a little farce called *My Own Ghost;* and keeps the audience in a roar of laughter, without so much as a smile on his face. He personates *Mr. Pearlbutton*, a prosperous but unhappy tailor, whose wife has run away with his foreman, *Sheers*—now his "cutter-out" in a double sense. He leaves the shop in a fit of despair, buys a hempen boa for as many pence as he gave guineas for a fur one for his faithless spouse, and rents a miserable haunted garret, where he resolves to leave the world as well as his shop-board. He is, however, comforted by the kindness of his hostess, and his resolution is shaken. He determines to "sleep on it;" but he is scarcely in bed before he is startled by hammering, and presently two men enter the room through a sliding pannel, and he is horrified at the idea of being burked. He listens, and finds from their talk that they are coiners: so, wrapping the sheet round him, he frightens them out of the room, alarms the house, and sends for the police. In the mean time, one of the men brings him word of his wife's return: she had only gone into the country to answer an advertisement, and had taken *Sheers* with her as her "man of business."

The drollery all rested on Reeve's shoulders—which are broad enough to bear a much heavier burden. His disconsolate look and manner when he contemplates the halter, and thinks of his dear Mrs. P., and tumbles into his damp and hard bed, in a cold, comfortless room, missing the usual accompaniment of Mrs. P.'s tongue to scold him to sleep—and the ludicrous figure he cuts in his half undress, with his white cotton night-cap on—were quite enough to shake the sides of a more fastidious audience.—*Examiner.*

From the London Metropolitan.

JAPHET IN SEARCH OF A FATHER.

Continued from p. 54.

After this affair of Miss Judd, I adhered steadily to my business, and profiting by the advice given me by that young person, improved rapidly in my profession, as well as in general knowledge; but my thoughts, as usual, were upon one subject—my parentage, and the mystery hanging over it. My eternal reveries became at last so painful, that I had recourse to reading to drive them away, and subscribing to a good circulating library, I was seldom without a book in my hand. By this time I had been nearly two years and a half with Mr. Cophagus, when an adventure occurred which I must attempt to describe with all the dignity with which it ought to be invested.

This is a world of ambition, competition, and rivalry. Nation rivals nation, and flies to arms, cutting the throats of a few thousands on each side till one finds that it has the worst of it. Man rivals man, and hence detraction, duels, and individual death. Woman rivals woman, and hence loss of reputation, and position in high, and loss of hair, and fighting with pattens in low life. Are we then to be surprised that this universal passion, undeterred by the smell of drugs and poisonous compounds, should enter into apothecaries' shops? Certainly not. Let me proceed. But two streets—two very short streets from our own—was situated the single-fronted shop of Mr. Ebenezer Pleggit. Thank heaven, it was only single-fronted; there, at least, we had the ascendancy over them. Upon other points, our advantages were more equally balanced. Mr. Pleggit had two large coloured bottles in his windows more than we had; but then we had two horses, and he had only one. He tied over the corks of his bottles with red coloured paper; we covered up the lips of our vials with true blue. It certainly was the case—for though an enemy, I'll do him justice—that after Mr. Brookes had left us, Mr. Pleggit had two shopmen, and Mr. Cophagus only one; but then that one was Mr. Japhet Newland; besides, one of his assistants had only one eye, and the other squinted horribly, so if we measured by eyes, I think the advantage was actually on our side; and as far as ornament went, most decidedly; for who would not prefer putting on his chimney-piece one handsome, elegant vase, than two damaged, ill-looking pieces of crockery? Mr. Pleggit had certainly a gilt mortar and pestle over his door, which Mr. Cophagus had omitted when he furnished his shop; but then the mortar had a great crack down the middle, and the pestle had lost its knob. And let me ask those who have been accustomed to handle it, what is a pestle without a knob?

On the whole, I think, with the advantage of having two fronts, like Janus, we certainly had the best of the comparison; but I shall leave the impartial to decide. All I can say is, that the feuds of the rival houses were most bitter—the hate intense—the mutual scorn unmeasureable. Did Mr. Ebenezer Pleggit meet Mr. Phineas Cophagus in the street, the former immediately began to spit as if he had swallowed some of his own vile adulterated drugs; and in rejoinder, Mr. Cophagus immediately raised the cane from his nose high above his forehead in so threatening an attitude, as almost to warrant the other swearing the peace against him, muttering, "Ugly puppy—knows nothing—um—patients die—and so on." It may be well supposed that this spirit of enmity extended through the lower branches of the rival houses—the assistants and I were at the deadly feud; and this feud was even more deadly between the boys who carried out the medicines, and whose baskets might, in some measure, have been looked upon as the rival ensigns of the parties, they themselves occupying the dangerous and honourable post of standard bearer. Timothy, although the

kindest-hearted fellow in the world, was as good a hater as Dr. Johnson himself could have wished to meet with; and when sometimes his basket was not so well filled as usual, he would fill up with empty bottles below, rather than the credit of the house should be suspected, and his deficiencies create a smile of scorn in the mouth of his red-haired antagonist, when they happened to meet going their rounds. As yet, no actual collision had taken place between either the principals or the subordinates of the hostile factions; but it was fated that this state of quiescence should no longer remain.

Homer has sung the battles of gods, demigods, and heroes; Milton the strife of angels. Swift has been great in his Battle of the Books; but I am not aware that the battle of the vials has as yet been sung; and it requires a greater genius than was to be found in those who portrayed the conflicts of heroes, demigods, gods, angels, or books, to do adequate justice to the mortal strife which took place between the lotions, potions, draughts, pills, and embrocations. I must tell the story as well as I can, leaving it as an outline for a future epic.

Burning with all the hate which infuriated the breasts of the two houses of Capulet and Montague, hate each day increasing from years of "biting thumbs" at each other, and yet no excuse presenting itself for an affray, Timothy Oldmixon—for on such an occasion it would be a sin to omit his whole designation—Timothy Oldmixon, I say, burning with hate and eager with haste, turning a corner of the street with his basket well filled with medicines hanging on his left arm, encountered equally eager in his haste, and equally burning in his hate, the red-haired Mercury of Mr. Ebenezer Pleggit. Great was the concussion of the opposing baskets, dire was the crash of many of the vials, and dreadful was the mingled odour of the abominations which escaped, and poured through the wicker interstices. Two ladies from Billingsgate, who were near, indulging their rhetorical powers, stopped short. Two tom cats, who were on an adjacent roof, just fixing their eyes of enmity, and about to fix their claws, turned their eyes to the scene below. Two political antagonists stopped their noisy arguments. Two dustmen ceased to ring their bells; and two little urchins eating cherries from the crowns of their hats, lost sight of their fruit, and stood aghast with fear. They met, and met with such violence, that they each rebounded many paces; but like stalwart knights, each kept his basket and his feet. A few seconds to recover breath; one withering, fiery look from Timothy, returned by his antagonist, one flash of the memory in each to tell them that they each had the *la* on their side, and "Take that!" was roared by Timothy, planting a well-directed blow with his dexter and dexterous hand upon the sinister and sinisterous eye of his opponent. "Take that!" continued he, as his adversary reeled back; "take that, and be d———d to you, for running against a *gentleman*."

He of the rubicund hair had retreated, because so violent was the blow he could not help so doing, and we all must yield to fate. But it was not from fear. Seizing a vile potation that was labelled "To be taken immediately," and hurling it with demoniacal force right on the chops of the courageous Timothy, "Take that!" cried he with a rancorous yell. The missile, well directed as the spears of Homer's heroes, came full upon the bridge of Timothy's nose, and the fragile glass shivering, inflicted divers wounds upon his physiognomy, and at the same time poured forth a dark burnt-sienna-coloured balsam, to heal them, giving pain unutterable. Timothy, disdaining to lament the agony of his wounds, followed the example of his antagonist, and hastily seizing a similar bottle of much larger dimensions, threw it with such force that it split between the eyes of his opponent. Thus with these dreadful weapons did they commence the mortal strife.

The lovers of *good order*, or at least of fair play, gathered round the combatants, forming an almost impregnable ring, yet of sufficient dimensions to avoid the missiles. "*Go it, red-head!*" "*Bravo! white apron!*" resounded on every side. Draughts now met draughts in their passage through the circumambient air, and exploded like shells over a besieged town. Boluses were fired with the precision of cannon shot, pill-boxes were thrown with such force that they burst like grape and canister, while acids and alkalies hissed, as they neutralised each other's power, with all the venom of expiring snakes. "Bravo! white apron!" "Red-head for ever!" resounded on every side as the conflict continued with unabated vigour. The ammunition was fast expending on both sides, when Mr. Ebenezer Pleggit, hearing the noise, and perhaps smelling his own drugs, was so unfortunately rash, and so unwisely foolhardy, as to break through the sacred ring, advancing from behind with uplifted cane to fell the redoubtable Timothy, when a mixture of his own, hurled by his own red-haired champion, caught him in his open mouth, breaking against his only two remaining front teeth, extracting them as the discharged liquid ran down his throat, and turning him as sick as a dog. He fell, was taken away on a shutter, and it was some days before he was again to be seen in his shop dispensing those medicines which, on this fatal occasion, he would but too gladly have dispensed with.

Reader, have you not elsewhere read in the mortal fray between knights, when the casque has been beaten off, the shield lost, and the sword shivered, how they have resorted to closer and more deadly strife with their daggers raised on high? Thus it was with Timothy: his means had failed, and disdaining any longer to wage a distant combat, he closed vigorously with his panting enemy, overthrew him in the first struggle, seizing from his basket the only weapons which remained, one single vial, and one single box of pills. As he sat upon his prostrate foe, first he forced the box of pills into his gasping mouth, and then with the lower end of the vial he drove it down his throat, as a gunner rams home the wad and shot into a thirty-two pound carronade. Choked with the box, the fallen knight held up his hands for quarter; but Timothy continued until the end of the vial, breaking out the top and bottom of the pasteboard receptacle, forty-and-eight of anti-bilious pills rolled in haste down red-head's throat. Timothy seized his basket, and amid the shouts of triumph walked away. His fallen-crested adversary coughed up the remnants of the pasteboard, once more breathed, and was led disconsolate to the neighbouring pump; while Timothy regained our shop with his blushing honours thick upon him.

But I must drop the vein heroical. Mr. Cophagus, who was at home when Timothy returned, was at first very much inclined to be wroth at the loss of so much medicine; but when he heard the story, and the finale, he was so pleased at Tim's double victory over Mr. Pleggit and his messenger, that he actually put his hand in his pocket, and pulled out half-a-crown.

Mr. Pleggit, on the contrary, was any thing but pleased; he went to a lawyer, and commenced an action for assault and battery, and all the neighbourhood did nothing but talk about the affray which had taken place, and the action at law which it was said would take place in the ensuing term.

But with the exception of this fracas, which ended in the action not holding good, whereby the animosity was increased, I have little to recount during the remainder of the time I served under Mr. Cophagus. I had been more than three years with him when my confinement became insupportable. I had but one idea, which performed an everlasting cycle in my brain. Who was my father? And I should have abandoned the profession to search the world in the hope of finding my progenitor, had it not been that I was without the means. Latterly I had hoarded up all I could collect; but the sum was

small, much too small for the proposed expedition. I became melancholy, indifferent to the business, and slovenly in my appearance, when a circumstance occurred which put an end to my further dispensing medicines, and left me a free agent.

It happened one market day that there was an overdriven, infuriated beast, which was making sad havoc. Crowds of people were running past our shop in one direction, and the cries of "Mad bull!" were re-echoed in every quarter. Mr. Cophagus, who was in the shop, and to whom, as I have before observed, a mad bull was a source of great profit, very naturally looked out of the shop to ascertain whether the animal was near to us. In most other countries, when people hear of any danger, they generally avoid it by increasing their distance; but in England, it is too often the case, that they are so fond of indulging their curiosity, that they run to the danger. Mr. Cophagus, who perceived the people running one way, naturally supposed, not being aware of the extreme proximity of the animal, that the people were running to see what was the matter, and turned his eyes in that direction, walking out on the pavement that he might have a fairer view.

He was just observing, "Can't say—fear—um—rascal Pleggit—close to him—get all the custom—wounds—contusions—and"———When the animal came suddenly round the corner upon Mr. Cophagus, who had his eyes the other way, and before he could escape, tossed him right through his own shop windows, and landed him on the counter. Not satisfied with this, the beast followed him into the shop. Timothy and I pulled Mr. Cophagus over towards us, and he dropped inside the counter, where we also crouched, frightened out of our wits. To our great horror the bull made one or two attempts to leap the counter; but not succeeding, and being now attacked by the dogs and butcher boys, he charged at them through the door, carrying away our best scales on his horns as a trophy as he galloped out of the shop in pursuit of his persecutors. When the shouts and halloos were at some little distance, Timothy and I raised our heads and looked round us; and perceiving that all was safe, we proceeded to help Mr. Cophagus, who remained on the floor bleeding, and in a state of insensibility. We carried him into the back parlour and laid him on the sofa. I desired Timothy to run for surgical aid as fast as he could, while I opened a vein; and in a few minutes he returned with our opponent, Mr. Ebenezer Pleggit. We stripped Mr. Cophagus, and proceeded to examine him. "Bad case this—very bad case, indeed, Mr. Newland—dislocation of the os humeri—severe contusion on the os frontis—and I'm very much afraid there is some intercostal injury. Very sorry, very sorry indeed, for my brother Cophagus." But Mr. Pleggit did not appear to be sorry; on the contrary, he appeared to perform his surgical duties with the greatest glee.

We reduced the dislocation, and then carried Mr. Cophagus up to his bed. In an hour he was sensible, and Mr. Pleggit took his departure, shaking hands with Mr. Cophagus, and wishing him joy of his providential escape. "Bad job, Japhet," said Mr. Cophagus to me.

"Very bad, indeed, sir; but it might have been worse."

"Worse—um—no, nothing worse—not possible."

"Why, sir, you might have been killed."

"Pooh! didn't mean that—mean Pleggit—rascal—um—kill me if he can—sha'n't though—soon get rid of him—and so on."

"You will not require his further attendance now that your shoulder is reduced. I can very well attend upon you."

"Very true, Japhet;—but won't go—sure of that—damned rascal—quite pleased—I saw it—um—eyes twinkled—smile checked—and so on."

That evening Mr. Pleggit called in, as Mr. Cophagus said that he would, and the latter showed a great deal of impatience; but Mr. Pleggit repeated his visits over and over again, and I observed that Mr. Cophagus no longer made any objection; on the contrary, seemed anxious for his coming, and more so after he was convalescent, and able to sit at his table. But the mystery was soon divulged. It appeared that Mr. Cophagus, although he was very glad that other people should suffer from mad bulls, and come to be cured, viewed the case in a very different light when the bull thought proper to toss him, and having now realised a comfortable independence, he had resolved to retire from business, and from a site attended with so much danger. A hint of this escaping when Mr. Pleggit was attending him on the third day after his accident, the latter, who knew the value of the *locale*, also hinted that if Mr. Cophagus was inclined so to do, that he would be most happy to enter into an arrangement with him. Self-interest will not only change friendship into enmity, in this rascally world, but also turn enmity into friendship. All Mr. Pleggit's enormities, and all Mr. Cophagus' shameful conduct, were mutually forgotten. In less than ten minutes it was "*My dear Mr. Pleggit*, and so on," and "*My dear brother Cophagus.*"

In three weeks every thing had been arranged between them, and the shop, fixtures, stock in trade, and good will, were all the property of our ancient antagonist. But although Mr. Pleggit could shake hands with Mr. Cophagus for his fixtures and *good will*, yet as Timothy and I were not included in the *good will*, neither were we included among the *fixtures*, and Mr. Cophagus could not, of course, interfere with Mr. Pleggit's private arrangements. He did all he could do in the way of recommendation, but Mr. Pleggit had not forgotten my occasional impertinence on the battle of the bottles. I really believe that his *ill will* against Timothy was one reason for purchasing the *good will* of Mr. Cophagus, and we were very gently told by Mr. Pleggit that he would have no occasion for our services. Mr. Cophagus offered to procure me another situation as soon as he could, and at the same time presented me with twenty guineas, as a proof of his regard and appreciation of my conduct—but this sum put in my hand decided me: I thanked him, and told him I had other views, at present, but hoped he would let me know where I might find him hereafter, as I should be glad to see him again. He told me he would leave his address with me at the Foundling, and shaking me heartily by the hand, we parted. Timothy was then summoned. Mr. Cophagus gave him five guineas, and wished him good fortune.

"And now, Japhet, what are you about to do?" said Timothy, as he descended into the shop.

"To do," replied I; "I am about to leave you, which is the only thing I am sorry for. I am going, Timothy, in search of my father."

"Well," replied Timothy, "I feel as you do, Japhet, that it will be hard to part; and there is another thing on my mind—which is, I am very sorry that the bull did not break the rudimans, (pointing to the iron mortar and pestle,) had he had but half the spite I have against it, he would not have left a piece as big as a thimble. I've a great mind to have a smack at it before I go."

"You will only injure Mr. Cophagus, for the mortar will not then be paid for."

"Very true; and as he has just given me five guineas, I will refrain from my just indignation. But now, Japhet, let me speak to you. I don't know how you feel, but I feel as if I could not part with you. I do not want to go in search of my father particularly. They say it's a wise child that knows its own father—but as there can be no doubt of my other parent—if I can only hit upon her, I have a strong inclination to go in search of my mother, and if you like my company, why, I will go with you—always, my dear Japhet," continued Tim,

"keeping in my mind the great difference between a person who has been feed as an M. D., and a lad who only carries out his prescriptions."

"Do you really mean to say, Tim, that you will go with me?"

"Yes, to the end of the world, Japhet, as your companion, your friend, and your servant, if you require it. I love you, Japhet, and I will serve you faithfully."

"My dear Tim, I am delighted; now I am really happy: we will have but one purse and but one interest; if I find good fortune you shall share it."

"And if you meet with ill luck, I will share that too—so the affair is settled—and, as here come Mr. Pleggit's assistants with only one pair of eyes between them, the sooner we pack up the better."

In half an hour all was ready; a bundle each contained our wardrobes. We descended from our attic, walked proudly through the shop without making any observation, or taking any notice of our successors; all the notice taken was by Timothy, who turned round and shook his fist at his old enemies, the iron mortar and pestle; and there we were, standing on the pavement, with the wide world before us, and quite undecided which way we should go.

"Is it to be east, west, north, or south, Japhet?" said Timothy.

"The wise men came from the east," replied I.

"Then they must have travelled west," said Tim; "let us show our wisdom by doing the same."

"Agreed."

Passing by a small shop, we purchased two good sticks, as defenders, as well as to hang our bundles on—and off we set upon our pilgrimage.

I believe it to be a very general action, when people set off upon a journey, to reckon up their means—that is, to count the money which they may have in their pockets. At all events, this was done by Timothy and me, and I found that my stock amounted to twenty-two pounds eighteen shillings, and Timothy's to the five guineas presented by Mr. Cophagus, and three halfpence which were in the corner of his waistcoat pocket—sum total, twenty-eight pounds three shillings and three halfpence; a very handsome sum, as we thought, with which to commence our peregrinations, and, as I observed to Timothy, sufficient to last us for a considerable time, if husbanded with care.

"Yes," replied he, "but we must husband our legs also, Japhet, or we shall soon be tired, and very soon wear out our shoes. I vote we take a hackney coach."

"Take a hackney coach, Tim! we mustn't think of it; we cannot afford such a luxury; you can't be tired yet, we are now only just clear of Hyde Park Corner."

"Still, I think we had better take a coach, Japhet, and here is one coming. I always do take one when I carry out medicines, to make up for the time I lose looking at the shops, and playing peg in the ring."

I now understood what Timothy meant, which was, to get behind and have a ride for nothing. I consented to this arrangement, and we got up behind one which was already well filled inside. "The only difference between an inside and outside passenger in a hackney coach, is, that the one pays and the other does not," said I, to Timothy, as we rolled along at the act of parliament speed of four miles per hour.

"That depends upon circumstances: if we are found out, in all probability, we shall not only have our ride, but be *paid* into the bargain."

"With the coachman's whip, I presume?"

"Exactly." And Timothy had hardly time to get the word out of his mouth, when flac, flac, came the whip across our eyes—a little envious wretch, with his shirt hanging out of his trowsers, having called out, *Cut behind!* Not wishing to have our faces, or our behinds cut any more, we hastily descended, and reached the footpath, after having gained about three miles on the road before we were discovered.

"That wasn't a bad lift, Japhet, and as for the whip I never mind that with *corduroys*. And now, Japhet, I'll tell you something; we must get into a wagon, if we can find one going down the road, as soon as it is dark."

"But that will cost money, Tim."

"It's economy, I tell you; for a shilling, if you bargain, you may ride the whole night, and if we stop at a public house to sleep, we shall have to pay for our beds, as well as be obliged to order something to eat, and pay dearer for it than if we buy what we want at the cooks' shops."

"There is sense in what you say, Timothy; we will look out for a wagon."

"Oh! it's no use now—wagons are like black beetles, not only in shape but in habits, they only travel by night—at least most of them do. We are now coming into long dirty Brentford, and I don't know how you feel, Japhet, but I find that walking wonderfully increases the appetite—that's another reason why you should not walk when you can ride—for nothing."

"Well, I'm rather hungry myself; and, dear me, how very good that piece of roast pork looks in that window!"

"I agree with you—let's go in and make a bargain."

We bought a good allowance for a shilling, and after sticking out for a greater proportion of mustard than the woman said we were entitled to, and some salt, we wrapped it up in a piece of paper, and continued our course, till we arrived at a baker's, where we purchased our bread, and then taking up a position on a bench outside a public-house, called for a pot of beer, and putting our provisions down before us, made a hearty, and, what made us more enjoy it, an independent meal. Having finished our pork and our porter, and refreshed ourselves, we again started and walked till it was quite dark, when we felt so tired that we agreed to sit down on our bundles and wait for the first wagon which passed. We soon heard the jingling of bells, and shortly afterward its enormous towering bulk appeared between us and the sky. We went up to the wagoner, who was mounted on a little pony, and asked him if he could give two poor lads a lift, and how much he would charge us for the ride.

"How much can you afford to give, measters? for there be others as poor as ye." We replied that we could give a shilling. "Well, then, get up in God's name, and ride as long as you will. Get in behind."

"Are there many people in there already?" said I, as I climbed up, and Timothy handed me the bundles.

"Noa," replied the wagoner, "there be nobody but a mighty clever poticary or doctor, I can't tell which; but he wear an uncommon queer hat, and he talk all sort of doctor stuff—and there be his odd man and his odd boy; that be all, and there be plenty of room, and plenty o' clean *stra*'."

After this intimation we climbed up, and gained a situation in the rear of the wagon under the cloth. As the wagoner said, there was plenty of room, and we nestled into the straw without coming into contact with the other travellers. Not feeling any inclination to sleep, Timothy and I entered into conversation, *sotto voce*, and had continued for more than half an hour, supposing by their silence that the other occupants of the wagon were asleep, when we were interrupted by a voice clear and sonorous as a bell.

"It would appear that you are wanderers, young men, and journey you know not whither. Birds seek their nests when the night falls—beasts hasten to their lairs—man bolts his door. '*Propria quæ maribus*,' as Herodotus hath it; which, when translated, means, that

'such is the nature of mankind.' '*Tribuantur mascula dicas*,' 'Tell me your troubles,' as Homer says."

I was very much surprised at this address—my knowledge of the language, for I had studied the grammar with Mr. Brookes, told me immediately that the quotations were out of the Latin grammar, and that all his learning was pretence; still there was a novelty of style which amused me, and at the same time gave me an idea that the speaker was an uncommon personage. I gave Timothy a nudge, and then replied—

"You have guessed right, most learned sir; we are, as you say, wanderers, seeking our fortunes, and trust yet to find them—still we have a weary journey before us. '*Haustus horâ somni sumendum*,' as Aristotle hath it; which I need not translate to so learned a person as yourself."

"Nay, indeed, there is no occasion; yet am I pleased to meet with one who hath scholarship," replied the other. "Have you also a knowledge of the Greek?"

"No, I pretend not to Greek."

"It is a pity that thou hast it not, for thou wouldst delight to commune with the ancients. Esculapius hath these words—'Asholder—offmotton—*accapon*—pasti—venison,'—which I will translate for thee—'We often find what we seek when we least expect it.' May it be so with you, my friend. Where have you been educated? and what has been your profession?"

I thought I risked little in telling, so I replied, that I had been brought up as a surgeon and apothecary, and had been educated at a foundation school.

"'Tis well," replied he; "you have then commenced your studies in my glorious profession; still have you much to learn; years of toil, under a great master, can only enable you to benefit mankind as I have done, and years of hardship and of danger must be added thereunto, to afford you the means. There are many hidden secrets. '*Ut sunt Divorum, Mars, Bacchus, Apollo, Virorum*.'—many parts of the globe to traverse, '*Ut Cato, Virgilius, fluviorum, ut Tibris, Orontes*.' All these have I visited, and many more. Even now do I journey to obtain more of my invaluable medicine, gathered on the highest Andes, when the moon is in her perigee. There I shall remain for months among the clouds, looking down upon the great plain of Mexico, which shall appear no larger than the head of a pin, where the voice of man is heard not. '*Vocito, vocitas vocativi*,' bending for months towards the earth. '*As in presenti*,' suffering with the cold—'*frico quod fricui dat*,' as Eusebius hath it. Soon shall I be borne away by the howling winds towards the new world, where I can obtain more of the wonderful medicine, which I may say never yet hath failed me, and which nothing but love towards my race induces me to gather at such pains and risk."

"Indeed, sir," replied I, amused with his imposition, "I should like to accompany you—for, as Josephus says most truly, '*Capiat pillulæ duæ post prandium*.' Travel, is, indeed, a most delightful occupation, and I would like to run over the whole world."

"And I would like to follow you," interrupted Timothy. "I suspect we have commenced our *grand tour* already—three miles behind a hackney coach—ten on foot, and about two, I should think, in this wagon. But as Cophagus says, '*Cochlearija crush many summendush*,' which means, 'there are ups and downs in this world.'"

"Hah!" exclaimed our companion. "He, also, has the rudiments."

"Nay, I hope I've done with the *Rudimans*," replied Timothy.

"Is he your follower?" enquired the man.

"That very much depends upon who walks first," replied Timothy, "but whether or no—we hunt in couples."

"I understand—you are companions. '*Concordat cum nominative numero et persona*.' Tell me, can you roll pills, can you use the pestle and the mortar, handle the scapula, and mix ingredients?"

I replied that of course I knew my profession.

"Well, then, as we have still some hours of night, let us now obtain some rest. In the morning, when the sun hath introduced us to each other, I may then judge from your countenances whether it is likely that we may be better acquainted. Night is the time for repose, as Quintus Curtius says, '*Custos, boe, fur atque soccerdos*.' Sleep was made for all—my friends, good night."

Timothy and I took his advice, and were soon fast asleep. I was awakened the next morning by feeling a hand in my trowsers' pocket. I seized it, and held it fast.

"Now just let go my hand, will you?" cried a lachrymal voice.

I jumped up—it was broad daylight, and looked at the human frame to which the hand was an appendix. It was a very spare, awkward built form of a young man, apparently about twenty years old, but without the least sign of manhood on his chin. His face was cadaverous, large goggling eyes, high cheek bones, hair long, reminding me of a rat's nest, thin lips, and ears large almost as an elephant's. A more wo-begone wretch in appearance I never beheld, and I continued to look at him with surprise. He repeated his words with an idiotical expression, "Just let go my hand, can't you?"

"What business had your hand in my pocket?" replied I, angrily.

"I was feeling for my pocket handkerchief," replied the young man. "I always keeps it in my breeches' pocket."

"But not in your neighbour's, I presume?"

"My neighbour's!" replied he, with a vacant stare. "Well, so it is, I see now—I thought it was my own."

I released his hand; he immediately put it into his own pocket, and drew out his handkerchief, if the rag deserved the appellation. "There," said he, "I told you I put it in that pocket—I always do."

"And pray who are you?" said I, as I looked at his dress, which was a pair of tight cotton drawers, and an old spangled jacket.

"Me! why, I'm the fool."

"More knave than fool, I expect," replied I, still much puzzled with his strange appearance and dress.

"Nay, there you mistake," said the voice of last night. "He is not only a fool by profession, but one by nature. It is a half-witted creature, who serves me when I would attract the people. Strange in this world, that wisdom may cry in the streets without being noticed, yet folly will always command a crowd."

During this address I turned my eyes upon the speaker. He was an elderly looking person, with white hair, dressed in a suit of black, ruffles and frill. His eyes were brilliant, but the remainder of his face it was difficult to decipher, as it was evidently painted, and the night's jumbling in the wagon had so smeared it, that it appeared of almost every colour in the rainbow. On one side of him lay a large three-cornered cocked hat, on the other a little lump of a boy, rolled up in the straw like a marmot, and still sound asleep. Timothy looked at me, and when he caught my eye, burst out into a laugh.

"You laugh at my appearance, I presume," said the old man, mildly.

"I do, in truth," replied Timothy. "I never saw one like you before, and I dare say never shall again."

"That is possible; yet probably if you meet me again you would not know me."

"Among a hundred thousand," replied Timothy, with increased mirth.

"We shall see, perhaps," replied the quack doctor, for such the reader must have already ascertained to be his profession; "but the wagon has stopped, and the driver will bait his horses; if inclined to eat, now is your time. Come, Jumbo, get up; Philotas, waken him, and follow me."

Philotas, for so was the fool styled by his master, turned up some straw, and stuffed the end of it into Jumbo's mouth. "Now Jumbo will think he has got something to eat. I always wake him that way," observed the fool, grinning at us.

It certainly, as might be expected, did waken Jumbo, who uncoiled himself, rubbed his eyes, stared at the cover of the wagon, then at us, and without saying a word, rolled himself out of the wagon after the fool. Timothy and I followed. We found the doctor bargaining for some bread and bacon, his strange appearance exciting much amusement, and inducing the people to let him have a better bargain than perhaps otherwise they would have done. He gave a part of the refreshment to the boy and the fool, and walked out of the tap-room with his own share. Timothy and I went to the pump, and had a good refreshing wash, and then for a shilling were permitted to make a very hearty breakfast. The wagon having remained about an hour, the driver gave us notice of his departure; but the doctor was no where to be found. After a little delay, the wagoner drove off, cursing him for a *bilk*, and vowing that he'd never have any more to do with a "larned man." In the mean time, Timothy and I had taken our seats in the wagon, in company with the fool and Master Jumbo. We commenced a conversation with the former, and soon found out, as the doctor had asserted, that he really was an idiot, so much so, that it was painful to converse with him. As for the latter, he had coiled himself away to take a little more sleep. I forgot to mention, that the boy was dressed much in the same way as the fool, in an old spangled jacket, and white trowsers. For about an hour Timothy and I conversed, remarking upon the strange disappearance of the doctor, especially as he had given us hopes of employing us; in accepting which offer, if ever it should be made, we had not made up our minds, when we were interrupted with a voice, crying out, "Hillo, my man, can you give a chap a lift as far as Reading, for a shilling?"

"Aye, get up, and welcome," replied the wagoner.

The wagon did not stop, but in a moment or two the new passenger climbed in. He was dressed in a clean smock frock, neatly worked up the front, leather gaiters, and stout shoes; a bundle and a stick were in his hand. He smiled as he looked round upon the company, and showed a beautiful set of small white teeth. His face was dark, and sunburnt, but very handsome, and his eyes as black as coals, and as brilliant as gas. "Hey! player folk—I've a notion," said he, as he sat down, looking at the doctor's attendants, and laughing at us. "Have you come far, gentlemen?" continued he.

"From London," was my reply.

"How do the crops look up above, for down here the turnips seem to have failed altogether! Dry seasons won't do for turnips."

I replied that I really could not satisfy him on that point, as it was dark when we passed.

"Very true—I had forgotten that," replied he. "However, the barleys look well; but perhaps you don't understand farming?"

I replied in the negative, and the conversation was kept up for two or three hours, in the course of which I mentioned the quack doctor, and his strange departure.

"That is the fellow who cured so many people at ——," replied he; and the conversation then turned upon his profession and mode of life, which Timothy and I agreed must be very amusing. "We shall meet him again, I dare say," replied the man. "Would you know him?"

"I think so, indeed," replied Timothy, laughing.

"Yes, and so you would think that you would know a guinea from a halfpenny, if I put it into your hands," replied the man. "I do not wish to lay a bet, and win your money; but I tell you, that I will put either one or the other into each of your hands, and if you hold it fast for one minute, and shut your eyes during that time, you will not be able to tell me which it is that you have in it."

"That I am sure I would," replied Tim; and I made the same assertion.

"Well, I was taken in that way at a fair, and lost ten shillings by the wager; now, we'll try whether you can tell or not." He took out some money from his pocket, selected without our seeing, put a coin into the hand of each of us, closing our fists over it, "and now," said he, "keep your eyes shut for a minute."

We did so, and a second or two afterwards we heard a voice which we instantly recognised. "Nay, but it was wrong to leave me on the way side thus, having agreed to pay the sum demanded. At my age one walketh not without fatigue, '*Excipenda tamen querlam sunt urbium*,' as Philostratus says, meaning, 'that old limbs lose their activity, and seek the help of a crutch."

"There's the doctor," cried Timothy, with his eyes still shut.

"Now open your eyes," said the man, "and tell me, before you open your hand, what there is in it."

"A halfpenny in mine," said Tim.

"A guinea in mine," replied I.

We opened our hands, and they were *empty*.

"Where the devil is it?" exclaimed I, looking at Tim.

"And where the devil 's the doctor?" replied he, looking round.

"The money is in the doctor's pocket," replied the man, smiling.

"Then where is the doctor's pocket?"

"Here," replied he, slapping his pocket, and looking significantly at us. "I thought you were certain of knowing him again. About as certain as you were of telling the money in your hand."

He then, to our astonishment, imitated the doctor's voice, and quoted *prosody, syntax, and Latin*. Timothy and I were still in astonishment, when he continued, "If I had not found out that you were in want of employ, and further, that your services would be useful to me, I should not have made this discovery. Do you now think that you know enough to entor into my service? It is light work, and not bad pay; and now you may choose."

"I trust," said I, "that there is no dishonesty?"

"None that you need practise, if you are so scrupulous; perhaps your scruples may some day be removed. I make the most of my wares—every merchant does the same. I practise upon the folly of mankind—it is on that, that wise men live."

Timothy gave me a push, and nodded his head for me to give my consent. I reflected a few seconds, and at last I extended my hand. "I consent," replied I, "with the reservation I have made."

"You will not repent," said he; "and I will take your companion, not that I want him particularly, but I do want you. The fact is, I want a lad of gentlemanly address, and handsome appearance—with the very knowledge you possess—and now we will say no more for the present. By-the-by, was that real Latin of yours?"

"No," replied I, laughing; "you quoted the grammar, and I replied with medical prescriptions. One was as good as the other."

"Quite—nay, better; for the school-boys may find me out, but not you. But now, observe, when we come to the next cross road, we must get down—at least, I expect so; but we shall know in a minute."

In about the time he mentioned, a dark, gipsy-looking man looked into the wagon, and spoke to our acquaintance in an unknown language. He replied in the same, and the man disappeared. We continued our route for about a quarter of an hour, when he got out, asked us to follow him, and speaking a few words to the fool, which I did not hear, left him and the boy in the wagon. We paid our fare, took possession of our bundles, and followed our new companion for a few minutes on the cross road, when he stopped, and said, "I must now leave you, to prepare for your reception into our fraternity; continue straight on this road until you arrive at a lime-kiln, and wait there till I come."

He sprang over a stile, and took a direction verging at an angle from the road, forced his way through a hedge, and disappeared from our sight. "Upon my word, Timothy," said I, "I hardly know what to say to this. Have we done right in trusting to this man, who I am afraid is a great rogue? I do not much like mixing with these gipsy people, for such I am sure he belongs to."

"I really do not see how we can do better," replied Timothy. "The world is all before us, and we must force our own way through it. As for his being a quack doctor, I see no great harm in that. People put their faith in nostrums more than they do in regular medicines; and it is well known that quack medicines, as they call them, cure as often as others merely for that very reason."

"Very true, Timothy; the mind once at ease, the body soon recovers, and faith, even in quack medicines, will often make people whole; but do you think that he does no more than impose upon people in that way?"

"He may, or he may not; at all events, we need do no more, I suppose?"

"I am not sure of that; however, we shall see. He says we may be useful to him, and I suppose we shall be, or he would not have engaged us—we shall soon find out."

By this time we had arrived at the lime-kiln to which we had been directed, and we sat down on our bundles, chatting, for about five minutes, when our new acquaintance made his appearance, with something in his hand, tied up in a handkerchief.

"You may as well put your coats into your bundles, and put on these frocks," said he; "you will appear better among us, and be better received, for there is a *gathering* now, and some of them are queer customers. However, you have nothing to fear; when once you are with my wife and me, you are quite safe; her little finger would protect you from five hundred."

"Your wife! who, then, is she?" enquired I, as I put my head through the smock frock.

"She is a great personage among the gipsies. She is, by descent, one of the heads of the tribe, and none dare to disobey her."

"And you—are you a gipsy?"

"No, and yes. By birth I am not, but by choice, and marriage, I am admitted; but I was not born under a hedge, I can assure you, although I very often pass a night there now—that is, when I am domestic; but do not think that you are to remain long here; we shall leave in a few days, and may not meet the tribe again for months, although you may see my own family occasionally. I did not ask you to join me to pass a gipsy's life—no, no, we must be stirring and active. Come, we are now close to them. Do not speak as you pass the huts, until you have entered mine. Then you may do as you please."

We turned short round, passed through a gap in the hedge, and found ourselves on a small retired piece of common, which was studded with about twenty or thirty low gipsy huts. The fires were alight, and provisions apparently cooking. We passed by nine or ten, and obeyed our guide's injunctions, to keep silence. At last we stopped, and perceived ourselves to be standing by the fool, who was dressed like us, in a smock frock, and Mr. Jumbo, who was very busy making the pot boil, blowing at the sticks underneath till he was black in the face. Several of the men passed near us, and examined us with no very pleasant expression of countenance; and we were not sorry to see our conductor, who had gone into the hut, return, followed by a woman, to whom he was speaking in the language of the tribe. "Nattee bids you welcome," said he, as she approached.

Never in my life will the remembrance of the first appearance of Nattee, and the effect it had, be erased from my memory. She was tall; too tall, had it not been for the perfect symmetry of her form. Her face of a clear olive, and oval in shape; her eyes jetty black; nose straight, and beautifully chiseled; mouth small, thin lips, with a slight curl of disdain, and pearly teeth. I never beheld a woman of so commanding a presence. Her feet were bare, but very small, as well as her hands. On her fingers she wore many rings, of a curious old setting, and a piece of gold hung on her forehead, where the hair was parted. She looked at us, touched her high forehead with the ends of her fingers, and waving her hand gracefully, said, in a soft voice, "You are welcome," and then turned to her husband, speaking to him in her own language, until by degrees they separated from us in earnest conversation.

She returned to us after a short time, without her husband, and said, in a voice, the notes of which were indeed soft, but the delivery of the words was most determined; "I have said that you are welcome; sit down, therefore, and share with us—fear nothing, you have no cause to fear. Be faithful, then; while you serve him, and when you would quit us, say so, and receive your leave to depart; but if you attempt to desert us without permission, then we shall suspect that you are our enemies, and treat you accordingly. There is your lodging while here," continued she, pointing to another hut. "There is but one child with you, this boy, (pointing to Jumbo,) who can lay at your feet. And now join us as friends. Fleta, where are you?"

A soft voice answered from the tent of Nattee, and soon afterwards came out a little girl, of about eleven years old. The appearance of this child was a new source of interest. She was a little fairy figure, with a skin as white as the driven snow—light auburn hair, and large blue eyes; her dress was scanty, and showed a large portion of her taper legs. She hastened to Nattee, and folding her arms across her breast, stood still, saying meekly, "I am here."

"Know these as friends, Fleta. Send that lazy Num (this was Philotas, the fool) for more wood, and see that Jumbo tends the fire."

Nattee smiled, and left us. I observed she went to where forty or fifty of the tribe were assembled, in earnest discourse. She took her seat with them, and marked deference was paid to her. In the mean time Jumbo had blown up a brisk fire; we were employed by Fleta in shredding vegetables, which she threw into the boiling kettle. Num appeared with more fuel, and at last there was nothing more to do. Fleta sat down by us, and parting her long hair which had fallen over her eyes, looked us both in the face.

"Who gave you that name, Fleta?" enquired I.

"They gave it me," replied she.

"And who are they?"

"Nattee, and Melchior, her husband."

"But you are not their daughter?"

"No, I am not—that is—I believe not."

The little girl stopped short, as if assured that she had said too much, cast her eyes down on the ground, and folded her arms, so that her hands rested on each opposite shoulder.

Timothy whispered to me, "She must have been stolen, depend upon it."

"Silence," said I.

The little girl overheard him, and looking at him, put her finger across her mouth, looking to where Num and Jumbo were sitting. I felt an interest for this child before I had been an hour in her company; she was so graceful, so beautifully feminine, so mournful in the expression of her countenance. That she was under restraint was evident; but still she did not appear to be actuated by fear. Nattee was very kind to her, and the child did not seem to be more reserved towards her than to others; her mournful, pensive look, was perhaps inherent to her nature. It was not until long after our first acquaintance that I ever saw a smile upon her features. Shortly after this little conversation, Nattee returned, walking with all the grace and dignity of a queen. Her husband, or Melchior, as. I shall for the present call him, soon joined us, and we sat down to our repast, which was excellent. It was composed of almost every thing; sometimes I found myself busy with the wing of a fowl, at another the leg of a rabbit—then a piece of mutton, and other flesh and fowl, which I could hardly distinguish. To these were added every sort of vegetable, in which potatoes predominated, forming a sort of stew, which an epicure might have praised. I had a long conversation with Melchior in the evening, and, not to weary the reader, I shall now proceed to state all that I then and subsequently gathered from him and others, relative to the parties with whom we were associating.

Melchior would not state who and what he was previous to his having joined the fraternity of gipsies; that he was not of humble birth, and that he had, when young, quitted his friends out of love for Nattee, or from some other causes not to be revealed, he also acknowledged. He had been many years in company with the tribe, and although, as one received into it, he did not stand so high in rank and estimation as his wife, still, from his marriage with Nattee, and his own peculiar qualifications and dexterity, he was almost as absolute as she was.

Melchior and Nattee were supposed to be the most wealthy of all the gipsies, and, at the same time, they were the most liberal of their wealth. Melchior, it appeared, gained money in three different characters; as a quack doctor, the character in which we first saw him; secondly, as a juggler, in which art he was most expert; and, thirdly, as a fortune teller, and *wise man*.

Nattee, as I before mentioned, was of very high rank, or caste, in her tribe. At her first espousal of Melchior she lost much of her influence, as it was considered a degradation; but she was then very young, and must have been most beautiful. The talents of Melchior, and her own spirit, however, soon enabled her to regain, and even add still more to, her power and consideration among the tribe, and it was incredible to what extent, with the means which she possessed, this power was augmented.

Melchior had no children by his marriage, and, as far as I could judge from the few words which would escape from the lips of Nattee, she did not wish for any, as the race would not be considered pure. The subdivision of the tribe which followed Nattee, consisted of about forty men, women, and children. These were ruled by her during the absence of her husband, who alternately assumed different characters, as suited his purpose; but in whatever town Melchior might happen to be, Nattee and her tribe were never far off, and always encamped within communication.

I ventured to question Melchior about the little Fista; and he stated that she was the child of a soldier's wife, who had been brought to bed, and died a few hours afterwards; that, at the time, she was on her way to join her husband, and had been taken ill on the road—had been assisted by Nattee and her companions, as far as they were able—had been buried by them, and that the child had been reared in the camp.

In time the little girl became very intimate, and very partial to me. I questioned her as to her birth, telling her what Melchior had stated; for a long while she would not answer; the poor child had learned caution even at that early age; but after we were more intimate, she said, that which Melchior had stated was *not true*. She could recollect very well living in a great house, with every thing very fine about her; but still it appeared as if it were a dream. She recollected two white ponies—and a lady, who was her mamma—and a mulberry tree, where she stained her frock; sometimes other things came to her memory, and then she forgot them again. From this it was evident that she had been stolen, and was probably of good parentage; certainly if elegance and symmetry of person and form could prove blood, it never was more marked than in this interesting child. Her abode with the gipsies, and their peculiar mode of life and manners, had rendered her peculiarly precocious in intellect; but of education she had none, except what was instilled into her by Melchior, whom she always accompanied when he assumed his character as a juggler. She then danced on the slack-wire, at the same time performing several feats in balancing, throwing of oranges, &c. When Melchior was under other disguises she remained in the camp with Nattee.

Of Num, or Philotas, as Melchior thought proper to call him, I have already spoken. He was a half-witted idiot, picked up in one of Melchior's excursions, and, as he stated to me, so did it prove to be the fact, that when on the stage, and questioned as a fool, his natural folly, and idiotical vacancy of countenance, were applauded by the spectators as admirably assumed. Even at the ale-houses and taverns where we stopped, every one imagined that all his folly was pretence, and looked upon him as a very clever fellow. There never was, perhaps, such a lachrymose countenance as this poor lad's, and this added still more to the mirth of others, being also considered as put on for the occasion. Stephen Kemble played Falstaff without stuffing—Num played the fool without any effort or preparation. Jumbo was also "picked up;" this was not done by Melchior, who stated, that any body might have him who claimed him; he tumbled with the fool upon the stage, and he also ate pudding to amuse the spectators—the only part of the performance which was suited to Jumbo's taste, for he was a terrible little glutton, and never lost any opportunity of eating, as well as of sleeping.

And now, having described all our new companions, I must narrate what passed between Melchior and me, the day after our joining the camp. He first ran through his various professions, pointing out to me that as juggler he required a confederate, in which capacity I might be very useful, as he would soon instruct me in all his tricks. As a quack doctor he wanted the services of both Tim and myself in mixing up, making pills, &c., and also in assisting him in persuading the public of his great skill. As a fortune-teller, I should also be of great service, as he would explain to me hereafter. In short, he wanted a person of good personal appearance and education, in whom he might confide in every way. As to Tim, he might be made useful, if he chose, in various ways; amongst others, he wished him to learn tumbling and playing the fool, when, at times, the fool was required to give a shrewd answer on any point on which he would wish the public to be made acquainted. I agreed to my own part of the performance, and then had some conversation with Timothy, who immediately consented to do

his best in what was allotted as his share. Thus was the matter quickly arranged, Melchior observing, that he had said nothing about remuneration, as I should find that trusting to him was far preferable to stipulated wages.

We had been three days in the camp when the gathering was broken up, each gang taking their own way. What the meeting was about I could not exactly discover; one occasion of it was, to make arrangements relative to the different counties in which the subdivisions were to sojourn during the next year, so that they might know where to communicate with each other, and at the same time not interfere by being too near; but there were many other points discussed, of which, as a stranger, I was kept in ignorance. Melchior answered all my questions with apparent candour, but his habitual deceit was such, that whether he told the truth or not was impossible to be ascertained by his countenance. When the gathering dispersed we packed up, and located ourselves about two miles from the common, on the borders of a forest of oak and ash. Our food was chiefly game, for we had some excellent poachers among us; and as for fish, it appeared to be at their command; there was not a pond or a pit but they could tell in a moment if it was tenanted—and if tenanted, in half an hour every fish would be floating on the top of the water, by the throwing in of some intoxicating sort of berry; other articles of food occasionally were found in the caldron; indeed, it was impossible to fare better than we did, or at less expense. Our tents were generally pitched not far from a pool of water; and, to avoid any unpleasant search which sometimes would take place, every thing liable to detection was sunk under the water until it was required for cooking; once in the pot, it was considered as safe. But with the foraging, Timothy and I had nothing to do; we participated in the eating, without asking any questions as to how it was procured. My time was chiefly spent in company with Melchior, who initiated me into all the mysteries of cups and balls—juggling of every description—feats with cards, and made me acquainted with all his apparatus for prepared tricks. For hours and hours was I employed by his directions in what is called "making the pass" with a pack of cards, as almost all tricks on cards depend upon your dexterity in this manœuvre. In about a month I was considered as a very fair adept; in the mean time, Timothy had to undergo his career of gymnastics, and was to be seen all day tumbling and retumbling, until he could tumble on his feet again. Light and active, he soon became a very dexterous performer, and could throw a somerset either backwards or forwards, walk on his hands, eat fire, pull out ribbons, and do fifty other tricks to amuse a gaping audience. Jumbo also was worked hard, to bring down his fat, and never was allowed his dinner until he had given satisfaction to Melchior. Even little Fleta had to practise occasionally, as we were preparing for an expedition. Melchior, who appeared determined to create an effect, left us for three days, and returned with not only dresses for Timothy and me, but also new dresses for the rest of the company; and shortly afterwards, bidding farewell to Nattee and the rest of the gipsies, we all set out—that is, Melchior, I, Timothy, Fleta, Num, and Jumbo. Late in the evening we arrived at the little town of ——, and took up our quarters at a public-house, with the landlord of which Melchior had already made arrangements.

"Well, Timothy," said I, as soon as we were in bed, "how do you like our new life and prospects?"

"I like it better than Mr. Cophagus's *rudimans*, and carrying out physic, at all events. But how does your dignity like turning Merry Andrew, Japhet?"

"To tell you the truth, I do not dislike it. There is a wildness and a devil-may-care feeling connected with it which is grateful to me at present. How long it may last I cannot tell; but for a year or two, it appears to me that we may be very happy. At all events, we shall see the world, and have more than one profession to fall back upon."

"That is true; but there is one thing which annoys me, Japhet, which is, we may have difficulty in leaving these people when we wish. Besides, you forget that you are losing sight of the principal object you had in view, that is, of 'finding out your father.'"

"I certainly never expect to find him among the gipsies," replied I, "for children are at a premium with them. They steal from others, and are not very likely therefore to leave them at the Foundling. But I do not know whether I have not as good a chance in our present employment as in any other. I have often been thinking that, as fortune-tellers, we may get hold of many strange secrets; however, we shall see. Melchior says that he intends to appear in that character as soon as he has made a harvest in his present."

"What do you think of Melchior, now that you have been so much with him?"

"I think him an unprincipled man, but still with many good qualities. He appears to have a pleasure in deceit, and to have waged war with the world in general. Still he is generous, and, to a certain degree, confiding; kind in his disposition, and apparently a very good husband. There is something on his mind which weighs him down occasionally, and checks him in the height of his mirth. It comes over him like a dark cloud over a bright summer sun, and he is all gloom for a few minutes. I do not think that he would *now* commit any great crime; but I have a suspicion that he has done something which is a constant cause of remorse."

"You are a very good judge of character, Japhet. But what a dear little child is that Fleta! She may exclaim with you—Who is my father?"

"Yes, we are both in much the same predicament, and that it is which I believe has so much increased my attachment to her. We are brother and sister in misfortune, and a sister she ever shall be to me, if such is the will of Heaven. But we must rise early to-morrow, Tim; so good night."

"Yes, to-morrow it will be juggle and tumble—eat fire—um—and so on, as Mr. Cophagus would have said; so good night, Japhet."

The next morning we arrayed ourselves in our new habiliments; mine were silk stockings, shoes, and white kerseymere knee breeches, a blue silk waistcoat loaded with tinsel, and a short jacket to correspond of blue velvet, a sash round my waist, a hat and a plume of feathers. Timothy declared I looked very handsome, and, as the glass said the same as plain as it could speak, I believed him. Timothy's dress was a pair of wide Turkish trowsers, and red jacket with spangles. The others were much the same. Fleta was attired in small, white satin, Turkish trowsers, blue muslin and silver embroidered frock, worked sandals, and her hair braided and plaited in long tails behind, and she looked like a little sylph. Melchior's dress was precisely the same as mine, and a more respectable company was seldom seen. Some musicians had been hired, and handbills were now circulated all over the town, stating that Mr. Eugenio Velotté, with his company, would have the honour of performing before the nobility and gentry. The bill contained the fare which was to be provided, and intimated the hour of the performance, and the prices to be paid for the seats. The performance was to take place in a very large room attached to the inn, which, previous to the decadence of the town, had been used as an assembly-room. A platform was erected on the outside, on which were placed the musicians, and where we all occasionally made our appearance, in our splendid dresses, to attract the wonder of the people. There we strutted up and down, all but poor little Fleta, who appeared to shrink at the display

from intuitive modesty. When the music ceased, a smart parley between Melchior and me, and Philotas and Timothy, as the two fools, would take place; and Melchior declared, after the performance was over, that we conducted ourselves to admiration.

"Pray, Mr. Philotas, do me the favour to tell me how many people you think are now present?" said Melchior to Num, in an imperative voice.

"I don't know," said Num, looking up with his idiotical, melancholy face.

"Ha! ha! ha!" roared the crowd at Num's stupid answer.

"The fellow 's a fool!" said Melchior to the gaping audience.

"Well, then, if he can't tell, perhaps you may, Mr. Dionysius," said I, addressing Tim.

"How many, sir? Do you want to know exactly and directly?"

"Yes, sir, immediately."

"Without counting, sir?"

"Yes, sir, without counting."

"Well, then, sir, I will tell, and make no mistake; there 's *exactly as many again as half*."

"Ha! ha! ha!" from the crowd.

"That won't do, sir. How many may be the half?"

"How many may be the half? Do you know yourself, sir?"

"Yes, sir, to be sure I do."

"Then there 's no occasion for me to tell you."

"Ha! ha! ha!"

"Well, then, sir," continued Melchior to Philotas, "perhaps you'll tell how many ladies and gentlemen we may expect to honour us with their company to-night."

"How many, sir?"

"Yes, sir, how many."

"I'm sure I don't know," said Num, after a pause.

"Positively you are the greatest fool I ever met with," said Melchior.

"Well, he does act the fool as natural as life," observed the crowd. "What a stupid face he does put on!"

"Perhaps you will be able to answer that question, Mr. Dionysius," said I to Tim.

"Yes, sir, I know exactly."

"Well, sir, let 's hear."

"In the first place, all the pretty women will come, and all the ugly ones stay away; and as for the men, all those who have got any money will be certain to come; those who hav'n't, poor devils, must stay outside."

"Suppose, sir, you make a bow to the ladies."

"A very low one, sir?"

"Yes, very low indeed."

Tim bent his body to the ground, and threw a somerset forward. "There, sir, I bowed so low that I came up on the other side."

"Ha! ha! capital!" from the crowd.

"I've got a round turn in my back, sir," continued Tim, rubbing himself. "Hadn't I better take it out again?"

"By all means."

Tim threw a somerset backwards. "There, sir, all 's right now. One good turn deserves another. Now I'll be off."

"Where are you going to, sir?"

"Going, sir! Why, I left my lollipop in the tinder-box, and I'm going to fetch it."

"Ha! ha! ha!"

"Strike up, music!" and Master Jumbo commenced tumbling.

Such was the elegant wit with which we amused and attracted the audience. Perhaps, had we been more refined, we should not have been so successful.

That evening we had the room as full as it could hold. Mr. Velotté, *alias* Melchior, astonished them. The cards appeared to obey his commands—rings were discovered in ladies' shoes—watches were powdered and made whole—canary birds flew out of eggs. The audience were delighted. The entertainment closed with Fleta's performance on the slack wire; and certainly never was there any thing more beautiful and graceful. Balanced on the wire in a continual, waving motion, her eyes fixed upon a point to enable her to maintain her position, she performed several feats—such as the playing with five oranges, balancing swords, &c. Her extreme beauty—her very picturesque and becoming dress—her mournful expression and downcast eyes—her gentle manner, appeared to win the hearts of the audience; and when she was assisted off from her perilous situation by Melchior and me, and made her graceful courtesy, the plaudits were unanimous.

When the company dispersed I went to her, intending to praise her, but I found her in tears. "What is the matter, my dear Fleta?"

"O nothing! don't say I have been crying—but I cannot bear it—so many people looking at me. Don't say a word to Melchior—I won't cry any more."

I kissed and consoled her; she threw her arms round my neck, and remained there with her face hid for some time. We then joined the others at supper. Melchior, much pleased with our success, and highly praising the conduct of Timothy and myself, which he pronounced was, for the first attempt, far beyond his expectations.

We continued to astonish all the good people of ——— for five days, when we discovered the indubitable fact, that there was no more money to be extracted from their pockets, upon which we resumed our usual clothes and smock frocks, and, with our bundles in our hands, set off for another market town, about fifteen miles distant. There we were equally successful, and Melchior was delighted with our having proved such a powerful acquisition to his troop; but not to dwell too long upon one subject, I shall inform the reader that after a trip of six weeks, during which we were very well received, we once more returned to the camp, which had located within five miles of our last scene of action. Every one was content—we were all glad to get back and rest from our labours. Melchior was pleased with his profits, poor little Fleta overjoyed to be once more in the seclusion of her tent, and Nattee very glad to hear of our good fortune, and to see her husband. Timothy and I had already proved ourselves so useful, that Melchior treated us with the greatest friendship and confidence—and he made us a present out of the gains, for our exertions; to me he gave ten, and to Timothy five pounds.

"There, Japhet, had you hired yourself I should not have paid you more than seven shillings per week, finding you in food; but you must acknowledge that for six weeks that is not bad pay. However, your earnings will depend upon our success, and I rather think that we shall make a much better thing of it when next we start, which will be in about a fortnight; but we have some arrangements to make. Has Timothy a good memory?"

"I think he has."

"That is well. I told you before that we are to try the 'Wise Man,'—but first we must have Nattee in play. To-morrow we will start for ———," mentioning a small quiet town about four miles off.

We did so, early the next morning, and arrived about noon, pitching our tents on the common, not far from the town; but in this instance we left all the rest of our gang behind. Melchior's own party and his two tents were all that were brought by the donkeys.

Melchior and I, dressed as countrymen, went into the town at dusk, and entered a respectable sort of inn, taking our seats at one of the tables in the tap-room, and, as we had already planned, after we had called for beer, commenced a conversation in the hearing of the others who were sitting drinking and smoking.

"Well, I never will believe it—it's all cheat and trickery," said Melchior, "and they only do it to pick your pocket. Tell your fortune, indeed! I suppose she promised you a rich wife and half a dozen children."

"No, she did not," replied I, "for I am too young to marry; but she told me what I know has happened."

"Well, what was that?"

"Why, she told me that my mother had married again, and turned me out of doors to work for my bread."

"But she might have heard that."

"How could she? No, that's not possible; but she told me I had a mole on my knee, which was a sign of luck. Now how could she know that?"

"Well, I grant that was odd—and pray what else did she promise you?"

"Why, she said that I should meet with my dearest friend to-night. Now that does puzzle me, for I have but one in the world, and he is a long way off."

"Well, if you do meet your friend, then I'll believe her; but if not, it has been all guess work; and pray what did you pay for all this—was it a shilling, or did she pick your pocket?"

"That's what puzzles me—she refused to take any thing. I offered it again and again, and she said, 'No; that she would have no money—that her gift was not to be sold.'"

"Well, that is odd. Do you hear what this young man says?" said Melchior, addressing the others, who had swallowed every word.

"Yes," replied one; "but who is this person?"

"The queen of the gipsies, I am told. I never saw such a wonderful woman in my life—her eye goes right through you. I met her on the common, and as she passed she dropped her handkerchief. I ran back to give it her, and then she thanked me, and said, 'Open your hand and let me see the palm. Here are great lines, and you will be fortunate;' and then she told me a great deal more, and bid God bless me."

"Then if she said that, she cannot have dealings with the *devil*," observed Melchior.

"Very odd—very strange—take no money—queen of the gipsies," was echoed from all sides.

The landlady and the bar-maid listened with wonder, when who should come in, as previously agreed, but Timothy! I pretended not to see him, but he came up to me, seizing me by the hand, and shaking it with apparent delight, and crying, "Wilson, have you forgot Smith?"

"Smith!" cried I, looking earnestly in his face. "Why so it is. How came you here?"

"I left Dublin three days ago," replied he, "but how I came here, into this house, is one of the strangest things that ever occurred. I was walking over the common, when a tall handsome woman looked at me, and said, 'Young man, if you will go into the third public-house you pass, you will meet an old friend, who expects you.' I thought she was laughing at me, but as it mattered very little in which house I passed the night, I thought, for the fun of the thing, I might as well take her advice."

"How strange!" cried Melchior, "and she told him the same—that is, he would meet a friend."

"Strange—very strange—wonderful—astonishing!" was echoed from all quarters, and the fame of the gipsy was already established.

Timothy and I sat down together, conversing as old friends, and Melchior went about from one to the other, narrating the wonderful occurrence till past midnight, when we all three took beds at the inn, as if we were travellers.

The report which we had circulated that evening induced many people to go out to see Nattee, who appeared to take no notice of them; and when asked to tell fortunes, waved them away with her hand. But, although this plan of Melchior's was, for the first two or three days very expedient, yet, as it was not intended to last, Timothy, who remained with me at the inn, became very intimate with the bar-maid, and obtained from her most of the particulars of her life. I, also, from repeated conversations with the landlady, received information very important, relative to herself and many of the families in the town; but as the employment of Nattee was for an ulterior object, we contented ourselves with gaining all the information we could before we proceeded further. After we had been there a week, and the fame of the gipsy woman had been marvellously increased—many things having been asserted of her which were indeed truly improbable—Melchior agreed that Timothy should persuade the bar-maid to try if the gipsy woman would tell her fortune: the girl, with some trepidation, agreed, but at the same time, expecting to be refused, consented to walk with him over the common. Timothy advised her to pretend to pick up a sixpence when near to Nattee, and ask her if it did not belong to her, and the bar-maid acted upon his suggestions, having just before that quitted the arm of Timothy, who had conducted her.

"Did you drop a sixpence? I have picked up one," said the girl, trembling with fear as she addressed Nattee.

"Child," replied Nattee, who was prepared, "I have neither dropped a sixpence, nor have you found one—but never mind that, I know that which you wish, and I know who you are. Now what would you with me? Is it to enquire whether the landlord and landlady of the Golden Lion intend to keep you in their service?"

"No," replied the girl, frightened at what she heard; "not to enquire that, but to ask what my fortune will be?"

"Open your palm, pretty maid, and I will tell you. Hah! I see that you were born in the west—your father is dead—your mother is in service—and—let me see—you have a brother at sea—now in the West Indies."

At this intelligence, all of which, as may be supposed, had been gathered by us, the poor girl was so frightened that she fell down in a swoon, and Timothy carried her off. When she was taken home to the inn, she was so ill that she was put into bed, and what she did say was so incoherent, that, added to Timothy's narrative, the astonishment of the landlady and others was beyond all bounds. I tried very hard to bring the landlady, but she would not consent; and now Nattee was pestered by people of higher condition, who wished to hear what she would say. Here Nattee's powers were brought into play. She would not refuse to see them, but would not give answers till she had asked questions, and, as from us she had gleaned much general information, so by making this knowledge appear in her questions to them, she made them believe she knew more. If a young person came to her, she would immediately ask the name—of that name she had all the references acquired from us, as to family and connections. Bearing upon them she would ask a few more, and then give them an abrupt dismissal.

This behaviour was put up with from one of her commanding presence, who refused money, and treated those who accosted her, as if she was their superior. Many came again and again, telling her all they knew, and acquainting her with every transaction of their life to induce her to prophesy, for such she informed them was the surest way to call the spirit upon her. By these means we obtained the secret history of the major part, that is, the wealthier part of the town of ———; and although the predictions of Nattee were seldom given, yet when given, they were given with such perfect and apparent knowledge of the parties, that when she left, which she did about six weeks after her first appearance, the whole town rang with accounts of her wonderful powers.

It will appear strange that Melchior would not permit Nattee to reap a harvest, which might have been great;

but the fact was, that he only allowed the seed to be sown that a greater harvest might be gathered hereafter. Nattee disappeared, the gipsies' tent was no longer on the common, and the grass, which had been beaten down into a road by the feet of the frequent applicants to her, was again permitted to spring up. We also took our departure, and rejoined the camp with Nattee, where we remained for a fortnight, to permit the remembrance of her to subside a little—knowing that the appetite was alive, and would not be satisfied until it was appeased.

After that time Melchior, Timothy, and I, again set off for the town of ———, and stopping at a superior inn in another part of the town, dressed as travellers, that is, people who go about the country for orders from the manufacturers, ordered our beds and supper in the coffee-room. The conversation was soon turned upon the wonderful powers of Nattee, the gipsy. "Nonsense," said Melchior, "she knows nothing. I have heard of her. But there *is* a man coming this way (should he happen to pass through this town) who will surprise and frighten you. No one knows who he is. He is named the Great Aristodemus. He knows the past, the present, and the future. He never looks at people's hands—he only looks you in the face, and *woe be to them who tell him a lie*. Otherwise, he is good-tempered and obliging, and will tell what will come to pass, and his predictions never have been known to fail. They say that he is hundreds of years old, and his hair is white as silver." At this information many expressed their doubts, and many others vaunted the powers of the gipsy. Melchior replied, "that all he knew was, that for the sum of two guineas paid down, he had told him of a legacy left him of six hundred pounds, which otherwise he would never have known of or received." All the town of ——— being quite alive for fortune-telling, this new report gained wind, and after a week's sojourn, Melchior thought that the attempt should be made.

We accordingly packed up, and departed to another market town. Timothy, dressed in a sombre suit of black, very much like an undertaker, was provided with a horse, with the following directions: to proceed leisurely until he was within half a mile of the town of ———, and then to gallop in as fast as he could, stop at the best inn in the place, and order apartments for the Great Aristodemus, who might be expected in half an hour. Every thing in this world depends upon appearances, that is, when you intend to gull it; and as every one in the town had heard of the Great Aristodemus, so every one was anxious to know something about him, and Timothy was pestered with all manner of questions; but he declared that he was only his courier, and could only tell what other people said; but then what other people said, by Timothy's account, was very marvellous indeed. Timothy had hardly time to secure the best rooms in the hotel, when Melchior, dressed in a long flowing silk gown, with a wig of long white hair, a square cap, and two or three gold chains hanging from his neck, certainly most admirably disguised, and attended by me in the dress of a German student, a wig of long brown locks hanging down my shoulders, made our appearance in a post-chaise and four, and drove up to the door of the inn, at a pace which shook every house in the street, and occasioned every window to be tenanted with one or more heads to ascertain the cause of this unusual occurrence, for it was not a very great town, although once of importance; but the manufactures had been removed, and it was occupied by those who had become independent by their own exertions, or by those of their forefathers.

The door of the chaise was opened by the obsequious Timothy, who pushed away the ostlers and waiters, as if unworthy to approach his master, and the Great Aristodemus made his appearance. As he ascended the steps of the door, his passage was for a moment barred by one whose profession Melchior well knew. "Stand aside, excise-man!" said he, in a commanding voice. "No one crosses my path with impunity." Astonished at hearing his profession thus mentioned, the excise-man, who was the greatest bully in the town, slipped on one side with consternation, and all those present lifted up their eyes and hands with astonishment. The Great Aristodemus gained his room, and shut his door; and I went out to pay for the chaise and order supper, while Timothy and the porters were busy with our luggage, which was very considerable.

"My master will not see any one," said I to the landlord; "he quits this town to-morrow, if the letters arrive which he expects by the post; therefore, pray get rid of this crowd and let him be quiet, for he is very tired, having travelled one hundred and fifty miles since the dawn of day."

When Tim and I had performed this duty, we joined Melchior in his room, leaving the news to be circulated. "This promises well," observed Melchior; "up to the present we have expended much time and money; now we must see if we cannot recover it tenfold. Japhet, you must take an opportunity of going out again after supper, and make enquiries of the landlord what poor people they have in the town, as I am very generous, and like to relieve them; you may observe, that all the money offered to me for practising my art, I give away to the poor, having no occasion for it." This I did, and we then sat down to supper, and having unpacked our baggage, went to bed, after locking the door of the room, and taking out the key.

The next morning we had every thing in readiness, and as the letters, as the reader may suppose, did not arrive by the post, we were obliged to remain, and the landlord ventured to hint to me, that several people were anxious to consult my master. I replied, that I would speak to him, but it was necessary to caution those who came, that they must either offer gold—or nothing at all. I brought his consent to see one or two, but no more. Now, although we had various apparatus to use when required, it was thought that the effect would be greater, if, in the first instance, every thing was simple. Melchior, therefore, remained sitting at the table, which was covered with a black cloth, worked with curious devices, and a book of hieroglyphics before him, and an ivory wand, tipped with gold, lying by the book. Timothy standing at the door, with a short Roman sword buckled round his belt, and I, in a respectful attitude, behind the Great Aristodemus.

The first person who was admitted was the lady of the mayor of the town; nothing could be more fortunate, as we had every information relative to her and her spouse, for people in high places are always talked of. Aristodemus waved his hand, and I brought forward a chair in silence, and motioned that she should be seated. Aristodemus looked her in the face, and then turned over several leaves, until he fixed upon a page, which he considered attentively. "Mayoress of ——, what wouldst thou with me?"

She started, and turned pale. "I would ask ——"

"I know; thou wouldst ask many things, perhaps, had I time to listen. Amongst others, thou wouldst ask if there is any chance of thy giving an heir to thy husband. Is it not so?"

"Yes, it is," replied the lady, fetching her breath.

"So do I perceive by this book; but let me put one question to thee. Wouldst thou have blessings showered on thee, yet do no good? Thou art wealthy—yet what dost thou and thy husband do with these riches? Are ye liberal? No. Give, and it shall be given. I have said."

Aristodemus waved his hand, and the lady rose to withdraw. A guinea was in her fingers, and her purse in her hand; she took out four more, and added them to the other, and laid them on the table.

"'Tis well, lady; charity shall plead for thee. Artolphe, let that money be distributed among the poor."

I bowed in silence, and the lady retired.

"Who will say that I do not good?" observed Melchior, smiling, as soon as she was gone. "Her avarice and that of her husband are as notorious as their anxiety for children. Now, if I persuade them to be liberal, I do service."

"But you have given her hopes."

"I have, and the very hope will do more to further their wishes than any thing else. It is despair which too often prevents those who have no children from having any. How often do you see a couple, who, after years waiting for children, have at last given up their hope, and resigned themselves to the dispensations of Providence, and then, when their anxiety has subsided, have obtained a family? Japhet, I am a shrewd observer of human nature."

"That I believe," replied I; "but I do not believe your last remark to be correct—but Timothy raps at the door."

Another lady entered the room, and then started back, as if she would retreat, so surprised was she at the appearance of the Great Aristodemus; but as Timothy had turned the key, her escape was impossible. She was unknown to us, which was rather awkward; but Melchior raised his eyes from his book, and waved his hand as before, that she should be seated. With some trepidation she stated, that she was a widow, whose dependence was upon an only son now at sea; that she had not heard of him for a long while, and was afraid that some accident had happened; that she was in the greatest distress—"and," continued she, "I have nothing to offer but this ring. Can you tell me if he is yet alive?" cried she, bursting into tears; "but if you have not the art you pretend to, O do not rob a poor, friendless creature, but let me depart!"

"When did you receive your last letter from him?" said Melchior.

"It is now seven months—dated from Bahia," replied she, pulling it out of her reticule, and covering her face with her handkerchief.

Melchior caught the address, and then turned the letter over on the other side, as it lay on the table. "Mrs. Watson," said he.

"Heavens! do you know my name?" cried the woman.

"Mrs. Watson, I do not require to read your son's letter—I know its contents." He then turned over his book, and studied for a few seconds. "Your son is alive."

"Thank God!" cried she, clasping her hands, and dropping her reticule.

"But you must not expect his return too soon—he is well employed."

"Oh! I care not—he is alive—he is alive! God bless you—God bless you!"

Melchior made a sign to me, pointing to the five guineas and the reticule; and I contrived to slip them into her reticule, while she sobbed in her handkerchief.

"Enough, madam; you must go, for others require my aid."

The poor woman rose, and offered the ring.

"Nay, nay, I want not thy money; I take from the rich, that I may distribute to the poor—but not from the widow in affliction. Open thy bag." The widow took up her bag, and opened it. Melchior dropped in the ring, and taking his wand from the table, waved it, and touched the bag. "As thou art honest, so may thy present wants be relieved. Seek, and thou shalt find."

The widow left the room with tears of gratitude; and I must say, that I was affected with the same. When she had gone, I observed to Melchior, that up to the present he had toiled for nothing.

"Very true, Japhet; but depend upon it, if I assisted that poor woman from no other feelings than interested motives, I did well; but I tell thee candidly, I did it from compassion. We are odd mixtures of good and evil. I wage war with fools and knaves, but not with all the world. I gave that money freely—she required it; and it may be put as a set-off against my usual system of fraud, or it may not—at all events I pleased myself."

"But you told her that her son was alive."

"Very true, and he may be dead; but is it not well to comfort her—even for a short time, to relieve that suspense which is worse than the actual knowledge of his death? Sufficient for the day is the evil thereof."

It would almost have appeared that this good action of Melchior met with its reward, for the astonishment of the widow at finding the gold in her reticule—her narrative of what passed, and her assertion, (which she firmly believed to be true,) that she had never left her reticule out of her hand, and that Melchior had only touched it with his wand, raised his reputation to that degree, that nothing else was talked about throughout the town, and, to crown all, the next day's post brought her a letter and remittances from her son; and the grateful woman returned, and laid ten guineas on the black cloth, showering a thousand blessings upon Melchior, and almost worshiping him as a supernatural being. This was a most fortunate occurrence, and as Melchior prophesied, the harvest did now commence. In four days we had received upwards of £200, and we then thought it time that we should depart. The letters arrived which were expected, and when we set off in a chaise and four, the crowd to see us was so great, that it was with difficulty we could pass through it.

BIRTH-PLACE OF GOLDSMITH.

Pallas-more, the birth-place of Goldsmith, is in the parish of Forghany, county Longford. Sir Walter Scott calls it Fernay, but this is a mistake. The hamlet of Pallas-more lies about three miles from Ballymahon, and about a mile from the high road which leads to Edgworthstown and the eastern part of the county. I walked up a green lane, and across some fields, and found myself at the hamlet. Goldsmith's house is not now in existence; there is only to be seen some small part of the wall of a fence, which seems to have enclosed the orchard. The site of the house is a little triangular field, overgrown with weeds and long grass. A few large ash-trees are scattered here and there; and close by are a few cottages, a little pond, and a very old orchard, with very old pear-trees in it, from which young Oliver most likely was wont to regale himself. From this spot there is a gentle slope down to some low meadows, through which flows the river Inny. The country round is a fruitful enclosed country of corn and pasture. Such is the spot, such the scenes, amidst which the infant genius of Goldsmith was nursed, and where he passed his early childhood. But it is supposed that when his father, who was probably curate of the chapel of ease at Forghany, was promoted to a benefice in Roscommon, Oliver was put to school at Ballymahon, where, upon the death of his father, Mrs. Goldsmith came and resided. Entries are now to be seen in a grocer's books, of articles furnished to Mrs. Goldsmith.

From the Quarterly Review.

Japan, voorgesteld in Schetsen over de Zeden en Gebruiken van dat Rijk; byzonder over de Ingezetenen der Stad Nagasaky. Door G. F. Meijlan, Opperhoofd aldaar. Amsterdam. 1830.

Bijdrage tot de Kennis van het Japansche Rijk. Door J. F. van Overmeer Fischer, Ambteenaar van Neêrlandsch Indie. Amsterdam. 1833.

It is hardly necessary to remind our readers that, from the year 1657, when the Portuguese were expelled from Japan, of all the nations of Europe the Dutch alone have been allowed access to the group of islands which constitute that empire. That this exclusive privilege has been ever confined within narrow limits, we knew from Kæmpfer and all the older authorities. From the works now under consideration, we learn that these limits have been progressively and recently narrowed, and that the trade which they still permit has so far declined under the discouragement and increasing jealousy of the natives, as to have become rather matter of curiosity and habit, than of commercial profit to the Hollander. Unconnected as our own country is, and must expect long to remain, by any bond of intercourse or communion with this extensive empire and singular people, we yet think that the majority of our readers will share with us the satisfaction and interest with which we receive any information, however scanty and imperfect, on this subject, from those who are alone enabled to afford it. We say advisedly, that we are likely to remain excluded from all means of investigation of our own.* In one instance, indeed, in the present century, our flag has waved in the harbour of Nagasaki, as we shall hereafter state, and with what result. We are aware also, that Sir Stamford Raffles, that great promoter of oriental enterprise, had his yearnings in that direction, and that the instructions for the late expedition to the Chinese seas embraced the contingency of an attempt at intercourse with Japan. We think it, however, much more likely that the sole remaining link between Europe and Japan, the Dutch connection, should be severed by violence or obliterated by disuse, than that either force or persuasion should devise a new one between this country or any of its dependencies and that empire; that New Holland, Borneo, or Central Africa, have a fairer chance of being diplomatised or dragooned into hospitality or submission towards us, within any period to which the speculation of mortal man can reasonably extend. The Dutch themselves, indeed, are confined to a solitary factory, and Decima, as a residence, presents means for the study of the three islands, little superior to those which the Isle of Sheppey would afford to a foreigner in this country, even though he were favoured with a biennial visit from the governor of Sheerness, and allowed about as often to make an excursion to Canterbury in a sedan chair, closely watched and attended by a body of the new police. The once annual visit of the deputies from the Dutch factory has been reduced to a quadrennial one—and it is at best a mere retreading of the route pursued by Kæmpfer, under circumstances and ceremonies precisely similar. Still the Dutch are the only Europeans permitted to inhabit that commercial prison, and to perform that unvaried journey, and whether a residence in Decima, and a pilgrimage to Jeddo, elicit new facts, or produce little more than a confirmation of those on record, we feel, in either case, thankful to any of them who, like Messrs Meylan and Fischer, will communicate their observations to the world. The two works in question are, indeed, locked up in a language which finds few students and fewer translators in this country or even on the continent: but these are not times when we expect Dutchmen to show complaisance to foreign nations, by abandoning their own language, and we are, therefore additionally pleased—to see them cultivating their national literature.

Mr. Meylan, the first author on our list, has resided for many years in the Dutch factory, where, we believe, he at this moment holds the situation of opperhoofd, or president. The unpretending title of "Sketches of Japan" would become a work more desultory and less instructive than the one before us. Into a thin octavo a great deal of information has been compressed; and the writer's observations are so concise and judicious, as to prove that the art of *book-making* is one which has been brought to little perfection at Decima. The volume of Mr. Fischer is a quarto, which, by its excellence of type and paper, and the singular beauty of its illustrations —being fac-similes of drawings by native Japanese artists—is of rank to figure on the shelves of an English collector, albeit as ignorant of Dutch as many collectors are of the languages in which the volumes they arrange on their shelves are composed. Mr. Fischer has resided nine years at Decima, and, in the year 1822, attended the president of the factory as secretary, on his journey to the metropolis. That he was zealous in his endeavours to profit by his opportunities for amassing information is proved by the volume before us, as well as by a splendid collection of Japanese curiosities which he succeeded in conveying to Amsterdam, and which, having lately been purchased by the King of Holland, is, we believe, like other similar possessions of that most munificent and judicious royal collector, open to the public at the Hague.

If the difficulty of learning any thing about Japan excite our curiosity, what we do learn of it is no less calculated to raise our wonder, and in some respects even our envy. Situated apart from either continent, between the old world and the new, it enjoys an immunity from almost the possibility of foreign aggression. It is true that

* It is worthy of remark that to English skill and courage the Dutch owe *their* first access to Japan. The Erasmus, the first Dutch ship which ever reached that coast in 1599, was piloted by William Adams. For his most curious and interesting adventures in that country, where his skill in mathematics and ship-building procured him a long but honourable detention, see *Harris's Collection of Voyages*, vol. i. p. 856. He deserves a high place in the list of the heroes of naval discovery and enterprise, and equally so among the diplomatists of commerce and civilisation.

tradition, and what to the European eye seems a strong resemblance, point to the main land of China as the primitive source of its language, religion, and customs, and that the introduction of these must imply conquest, if not discovery and original occupation. But these are events lost in the night of antiquity; and it appears that from the commencement of its annals, whenever an attempt at invasion has been made, the natural difficulties of access have been a sufficient protection; the current, the shoal, and the typhoon, have spared the Japanese Drakes and Effinghams all occasion for exhibiting their valour against the Tartar armadas of times within the record of history.* A country, for whose natural features Mr. Fischer finds his nearest European comparison in the Maggiores, Comos, and Luganos of northern Italy—cultivated like a garden to the summit of its hills; a climate under which the principal productions of the tropics grow side by side with those of southern Europe; a territory indented by seas, and intersected by lakes and rivers, swarming with every animal production of the water: a soil on which the radish attains the Brobdignag weight of sixty pounds, and the blossom of the plum expands to the size of an English cabbage rose;—and all this tenanted by thirty-four millions of people, living under a despotism, and that despotism not the will of an individual, but the fiat of rigid but stedfast, severe but immutable law, which, for at least two centuries past, has kept the community as free from civil dissension as from foreign invasion:—such is the picture presented to us by the most recent visiters to the shores of these *fortunate islands*. Do they not deserve the name, and ought even we, in the pride of our hearts, to spurn the fanciful parallel which some writers have drawn between Japan and Great Britain? The comparison can, indeed, be pursued little further than respects the magnitude of insular sovereignty, the difficulties in the way of invasion from without, and a threefold geographical demarcation, extant, indeed, more distinctly in the case of the three islands of Nipon, Sicoco, and Kisnu, than in that of England, Scotland, and Ireland. Where, however, in the well ordered empire of Japan Proper can we find the counterpart of Ireland? Where is the Japanese Connaught? Which of her sixty-eight peaceful provinces represents Tipperary? When has a Budhist been insulted by a follower of Sinto? What voice has been raised to repeal the union between Nankaydoo and Saykadoo, or to pronounce that Tookaydoo shall no longer contain the centre of government for both?

It would be idle, however, to suppose that, upon closer observation, darker features in the condition of these islands should not present themselves; nor is it to be imagined that the state of prosperous stagnation which all accounts concur in describing as the result of their social institutions, can be purchased except by a large sacrifice of mental freedom, and almost every prospect of further advancement. The summary which is to be gathered from these volumes of the *history* of Japan contains little that is not to be found in Kæmpfer. There are points connected with that history, on which the archives of the Dutch factory might be supposed to have preserved information of some interest; but they are subjects on which, even in that case, Dutch writers may be excused (if any *suppressio veri* be excusable) for avoiding to dwell—we mean the expulsion of the Portuguese, and the bloody extermination of Christianity. Few portions of the religious history of the world would be more interesting than a faithful record of these events. In the annals of Christianity, few examples have occurred of a triumph so rapid, followed by destruction so complete. Whether the force of circumstances *compelled* the Jesuits, who were agents of that great conversion, to associate themselves with a party in the civil feuds which then distracted Japan, or whether they did so voluntarily and in pursuance of the alleged practice of that order—of which their first apostle Xavier was a joint founder with Loyola—may be doubtful; certain it is that in an evil hour they took their part in the dispute, and perished. Japanese tradition attributes to them as a cause and justification of their fall, their rapacity and sensuality. This we doubt—those vices are usually the attendants of long and undisputed possession, rather than the circumstances in which these missionaries of a religion struggling into life were placed. It is likely that the hostility of their Dutch rivals may have magnified individual instances of such errors, and that the zeal of triumphant persecution may have perpetuated the imputation. It is also clear that the conduct of the Dutch, in conveying the fatal intelligence of the alleged designs of the Jesuits, was influenced rather by commercial jealousy, than by any indignation at the errors of their doctrine or the vices of those who preached it. Mr. Fischer admits that the Dutch were compelled to join in the persecution against the stubborn remnant of the Christian host, who, after the expulsion of the Portuguese in 1637, took refuge in the province of Sinabara. The siege, however, being converted into a blockade, the vessel furnished by the Dutch was, as they allege, allowed to return. The Christians preferred death to surrender, and 40,000 men are said to have perished on both sides before the extermination was effected. The magnitude of the holocaust affords some measure of the depth and tenacity with which Christianity had struck its roots into a soil, where it would now appear that little less than miracle can ever replant it.

From some of the Dutch accounts, we gather that the Hollanders, in the ardour of their rivalry with the Portuguese, nearly overreached themselves; for the latter, when they found that Christianity was placed under ban, informed the government, to its great surprise, that the Dutch themselves were *Christians*.* How the protestant Hollanders escaped being thus forcibly ab-

* This was the case in 1281, when the Japanese rejected the yoke of the Tartar conqueror of China, Che Tsou. He fitted out an expedition of 100,000 men from Corea, but his fleet was dashed on the island of Firando, and not a tenth part of his ships escaped destruction.

* See Valentyn—Description of the Old and New East Indies, vol. iv. article Japan.

sorbed into the bosom of the Romish church and sharing the honours of martyrdom, does not exactly appear, but we suspect that some of the tales, however often contradicted, of compulsory insults to the cross, had their origin in real events of this period. It is certain that the Dutch have ever since been confined to the area of the fan-like Decima, and that an imperial order is still read to them, on the great occasions of meeting between the governor of Nagasaki and the president of the factory, enjoining them to refrain from all communication with the Portuguese—a trifling circumstance, which proves satisfactorily to our minds the happy ignorance of the Japanese as to the modern politics of Europe; or, perhaps, a still wiser resolution, to affect an utter ignorance about them. In 1673, when an English ship was sent to attempt a revival of intercourse with Japan, the first question asked was whether it was long since the English king had married a daughter of the King of Portugal. This alliance was made the pretext of the total refusal of the Japanese to permit any revival of English intercourse.

It appears that the religious opinions of Japan may be classed under two great divisions, the Sinto and Boedso, the former being the sect which has been *established* from time immemorial in the country, the latter being understood to include the numerous modes of religious belief which have been imported from other countries. Mr. Meylan divides it into the Brahminical doctrine of Xaca, and the Chinese as established by Confucius. We cannot follow Mr. Meylan through his curious sketch of the various sects into which the followers of the Boedso are again subdivided, but we quote some of his remarks on the fact of the total and entire absence of religious dissension in a country containing some dozen established churches, of which the one of the highest acknowledged antiquity bears but a small numerical proportion to the others, if we can judge, by the ecclesiastical statistics of Nagasaki, of those of the empire at large. Out of sixty-one temples in that city and its environs, only seven belong to the Sinto persuasion.

"Never," says Mr. Meylan, "do we hear of any religious dispute among the Japanese, much less discover that they bear each other any mutual hate on religious grounds. They esteem it, on the contrary, an act of courtesy to visit from time to time each other's gods and do them reverence. While the Koeboe sends an embassy to the Sinto temple at Tsie, to offer prayers in his name to the invisible God, he assigns, at the same time, a sum for the erection of temples to Confucius; and the spiritual emperor allows strange gods imported from Siam or China, to be placed for the convenience of those who may feel a call to worship them, in the same temples with the Japanese. If it be asked whence this tolerance originates, and by what it is maintained: I reply from this, that worshippers of all persuasions in Japan acknowledge and obey one superior, namely, the Dayrie or Spiritual Emperor. As the representative and lineal descendant of God on earth, he is himself an object of worship, and as such, he protects equally all whose object it is to venerate the Deity; the mode of their so doing being indifferent to him. Let it not be thought that I prize this tolerance too high, nor let the cruel persecutions of the Christians in Japan be objected to me; I ask whether this toleration was not one of the causes which so far facilitated the introduction of Christianity there; but that which with me is conclusive is, that could the preachers of the gospel in Japan have been tolerant as the Japanese; had they not abided in the fast conviction that the belief in Christ was the only true road to salvation; and had they not in that conviction mocked and despised the gods of the country; could it have been possible that the bishops chosen from the first missionaries should have receded from insisting on their right of total independence, and could they have consented to place themselves under the protection of God's representative on earth, which the Japanese acknowledge in their Dayrie; lastly, could they have forborne to meddle in affairs of politics and government, then would no persecution of Christianity, in all human probability, have taken place, and perhaps, at this moment, the more perfect doctrine of Jesus would have triumphed over that of Confucius." —p. 79.

Whatever may be the merits of the plan thus, somewhat late indeed, suggested by our philosophical Opperhoofd, we own our surprise that the Jesuits did not hit upon it, except, perhaps, as far as abstinence from politics is concerned.

Before we quit this subject we must advert to a statement which we do not remember to have seen elsewhere than in the sketches of Mr. Meylan. He relates that a faith usually classed among those of Brahminical origin, and which had once been nearly universal in Japan, has, from its near resemblance in its doctrines to the form of Christianity introduced by the Portuguese, been involved in one and the same ruin. Its doctrines appear to have comprised the *existence, death, and resurrection of a Saviour born of a virgin*, with almost every other essential of Christianity, including the belief in the trinity. If this be a true statement and correct description, and if we then add to it the tradition that this form of religion was introduced under the reign of the Chinese emperor Mimti, who ascended the throne in about the fiftieth year of the Christian era, can we avoid admitting the conclusion that some early apostle reached the eastern extremity of Asia, if not the islands themselves of Japan?

The allusion in the foregoing passage to the person of the Dayrie, otherwise called the Mikaddo, the *spiritual emperor* of Japan, brings us to the consideration of its government; and it must be admitted that institutions which, for more than two centuries, have afforded some thirty-six millions of men the blessings of profound peace, accompanied by security of property, and a considerable share of the other elements of worldly prosperity, are not an unworthy subject of contemplation. For imitation we cannot, indeed, propose them to European readers. Whatever may be our opinion of the existing state of things, under the reform bill and the present administration, we cannot look forward to the establishment of Lord Durham as Koeboe at St. James's, or the installation of Dr. Maltby as Dayrie of Canterbury, enjoying the spiritual supremacy of the protestant, Roman catholic, unitarian, and Jewish churches, to be held by him and his heirs for ever. It is well known, however, that a form of government bearing a near resemblance to the result of such a proceeding as the above, is established in Japan on a footing which seems to set at defiance all speculation as

to its probable continuance. The system, indeed, is not, we are told, based on long prescription, and its apparent stability is to be ascribed solely to the success of its working and the wisdom with which its foundations were laid. From the close of the sixteenth century, when the Japanese *maire du palais*, Tayko Sama, separated the empire into its two lay and spiritual divisions, civil war has ceased, the pageant of government has been played on without interruption by the two principal actors and their subordinates, and the operations of the real executive have been continued with all the regularity and precision of machinery. The founder of these institutions must surely have been no ordinary legislator. The sceptre which he wielded has indeed become a bauble in the hands of his descendants, for the koeboe or lay emperor, equally with his spiritual counterpart, wears out his life in one long dream of ideal sovereignty: and so profound and subtle is the spell of habit, custom, and etiquette which wraps them in that charmed sleep, that it is impossible to anticipate the period of its dissolution, or the process by which it can be broken.

Mr. Fischer, indeed, hazards the conjecture, that by a quarrel between the koeboe and the dayrie, and by such an event alone, can any innovation or revolution ever take place in the existing political institutions of Japan. His conjecture, however, does not extend to the nature of the contingency which could ever bring about the collision. If apprehension, indeed, imply the existence of danger, and if caution indicate that apprehension, the frailty of those institutions might well be inferred; for suspicion and distrust prevail through every link of the social chain, and the precautions against foreign aggression, so apparent in their treatment of the only nations with whom intercourse is permitted, the Dutch and Chinese, are fully equaled by those adopted against innovation or disturbance within. A system of espionage extends itself throughout the empire, which embraces not only every public functionary, including the emperor himself, but every component part of society, down to the divisions of five families, into which—somewhat after the fashion introduced into England by our own great Saxon legislator—the population is every where divided. The dayrie resides a perpetual prisoner in his palace in the city of Miako, except on the rare occasion of a visit to the temple of Tsiwoinjo. Mr. Fischer doubts the tales in circulation of his being precluded from setting his foot to the earth, or allowing the sun to shine upon him; but that so old a sojourner and so close an observer should only *doubt* on such a subject, and not be able at once to contradict these stories, seems to us confirmation strong that such, or still closer restrictions, prevail. He is allowed, we are glad to learn, the solace—shall we call it?—of a wife and twelve concubines, and such diversion as music, poetry, and study, can afford. His pipe is smoked but once, and the dishes from which he has eaten are broken, like the tea-cup which Dr. Johnson threw into the fire; but Mr. Fischer adds, that these articles are economically provided of the simplest manufacture, and it is reported that no great substantial expense is permitted for the support of this shadow of sovereignty. When he dies, the event is sedulously concealed till his successor is fully installed in office, and the cry is raised of "Live the dayrie!" without even the preliminary half of the old French formula, "the dayrie is dead." The court is formed of a long hierarchy of spiritual officials. Among these are the kwanbakf, who represents the dayrie's person and executes his functions. From this office the koeboe is excluded. To the third spiritual office in rank, or sadayzin, he—the temporal sovereign—is sometimes admitted, as was the case with the reigning koeboe in 1822, on the occasion of his having completed fifty years of sovereignty. It ranks him with the gods, and no layman, from the time of Tayko Sama, had been before so honoured.

This lay emperor is, like the dayrie, shut up in the palace of Jeddo, in itself a city equal in size to Amsterdam. On the supposition that the affairs of his subjects are beneath his notice and dignity, he is surrounded by a circle of guards and ceremonies, which effectually prevent him from employing his royal leisure in any such ignominious pursuit. All other places of residence must appear mean and unworthy in comparison with the royal palace, and he is therefore never allowed to leave it.

The real executive is in the hands of seven councillors or ministers of the first class, six of the second, and two other ministers of the nature of inquisitors, whose peculiar province it is to guard against the slightest revival of the Christian religion in the empire. This council is presided over by a prime minister, and in case of irreconcileable difference of opinion among its members, the question is submitted to the arbitration—not of the emperor, but—of his three nearest relations, including always the heir apparent. With this council communicate the governors of the sixty-eight provinces into which Tayko Sama divided the empire, or rather the two secretaries of the said governors, to whom the real administration is confided. The nominal governments are hereditary, and are usually so burthensome and expensive to the occupant, that he takes the opportunity of committing his office to his son, the moment the latter arrives at years of discretion. It is necessary, therefore, in practice, to commit the real power to more experienced hands. The two secretaries take alternate turns of annual residence at the seat of their government and at the palace of Jeddo, their wives and families constantly remaining as hostages in the latter. While in their provinces, they are surrounded by the strictest precautions of etiquette and ceremony, are compelled to abstain from all intercourse with the other sex, and their hours of rising, eating, sleeping, going out, &c., are prescribed by rigid and invariable rule. Besides these provincial governments or counties with their lord-lieutenants and secretaries, the empire contains a certain number of royal cities under separate governors subject to similar regulations. The spies of the government are selected from every class of society, and it is said that Fouché or Savary might have studied with advantage in this vast

seminary of secret intelligence. Mr. Meylan, who professes to confine his reports principally to the city of Nagasaki, and to facts which have come under his personal observation, devotes one of his most interesting sketches to the local administration of that place, which is one of the above mentioned imperial cities. Here we find the system of espionage pervading the minuter divisions of society, to an extent, perhaps, never paralleled in any other country of the globe.

"Not only," says Mr. Meylan, "is the head of every family answerable for his children, his servants, and the stranger within his gates, but the city being divided into collections of five families, every member of such division is responsible for the conduct of the others, and in consequence, that which, according to European ideas, would be the height of indiscretion, becomes here the duty of every man, for every extraordinary occurrence which falls out in an household is reported by four curious witnesses to the members of the civil administration. House arrest is usually the penalty of the irregularities thus reported, and a severe one. The doors and windows of the offender's house are closed, generally for a hundred days, his employments are suspended, salary, if any, stopped, and the friend and the barber alike forbidden entrance. Every household is held bound to produce a man capable of bearing arms; a division of five constitutes a company; twenty-five such companies are arrayed under an officer, and constitute a brigade of six or seven thousand men; and thus the force of the city, apart from the regular military, or police, can be presently mustered. Guard-houses are established in every street, in which a guard is on duty every night, and on occasions of festivity or other cause of popular concourse, by day, each street has a rail or barrier at its issues, and can consequently be cut off from communication with the rest of the city at a moment's notice."

On the effects of this highly artificial system as to the prevention of crime, Mr. Meylan does not profess to decide, but he states that property and person are singularly secure, and that corporal punishment is rare. The latter circumstance, however, he is inclined to attribute to three causes; *viz.* to the severity of the law, its strict execution where guilt is proved, and the reluctance—there being no public prosecutor—of individuals to come forward as complainants in cases of a graver description.

The national character of the Japanese, as represented by our authors, is such as we might anticipate of a people largely endowed with the good things of this world, and utterly secluded from the remainder of the globe. Pride, sensuality, and ignorance, are its marking features, and this people and the Chinese reverse our western adage of *omne ignotum pro magnifico*, or substitute for the latter the word *ignobili*: for the profound ignorance of the rest of the world which involves these two great branches of the Tartar family appears to produce nothing but a complaisant assurance of their own superiority, and the most unmitigated contempt for the nations whose existence is darkly known to them. Over the Chinese, indeed, the Japanese possess one great advantage, in the access, which their learned men obtain and cultivate, to one language at least of modern Europe, the Dutch, which we suspect is better understood at Jeddo than in Paris; but in every other respect their communications with that nation can only tend to exalt their national arrogance, by the contemplation of the humble and abject posture which the Dutch are satisfied to assume in their dealings with them. It is probable, also, that the information their curiosity may occasionally extract from such a source as to other nations, tends to mislead rather than instruct. This national attribute of pride is also based on the universal belief that they are directly descended from the gods. With respect to their sensuality, it appears such as might be expected from a country which affords every means of indulgence, and where religion presents no check, nor custom any impediment of disguise. Nagasaki affords, we are told, for a population of 70,000 souls, sixty temples, and seven hundred tea-houses or public brothels; but were we to apply the same relative statistical test to the Christian capitals of Holland and England—we say nothing of the more decorous but extensive profligacy of Paris—would the result be more favourable? In Japan, at least, custom admits, after a season, the female inmates of these haunts into the bosom of society, and they become, it is said, exemplary wives and mothers. From this source, also, the inhabitants of the European factory obtain a certain class of female servants, who are said to attach themselves with strict fidelity to their masters for the time being.

Our readers are probably aware that the life of the Dutch resident is otherwise one of professed celibacy, no female being allowed to arrive on board of the annual vessel. Neither are any of the Japanese, who may be hired as male servants, allowed to remain in the factory between sunset and sunrise. "How then," asks Mr. Meylan, with innocent *naiveté*, "could the Dutch resident otherwise manage to procure any domestic comfort in the long nights of winter, his tea-water, for instance, were it not for these *inmates*?" The argument is, we admit, unanswerable, as to mere menial offices, but, as to the more tender services which are hinted at, we suspect that the wives left behind in Holland or Batavia would *not* concur in its cogency—nor do we suppose that Mr. Meylan would extend to those ladies a similar indulgence, even though they could affect a similar excuse.

The great feature of the social polity of Japan is the hereditary nature of all employments, avocations, and situations in life, and the consequent absence of most of those incentives of ambition which form the life-blood of European society. The population is divided into eight classes:—1. The reigning princes or governors. 2. The nobility. 3. The priests. 4. The military. 5. The civil officers, in which class Mr. Meylan includes the polite circles, &c. 6. The traders. 7. The handicraftsmen. 8. The labourers. Among all these there is but one profession, which, like the Parias of India, appears to remain under ban, or stigma, viz. that of the tanners. All intercourse with these is shunned and forbidden, and the executioners are chosen exclusively from their ranks. The three first lay classes claim the honourable but somewhat cumbrous privilege of wearing two sabres; the fifth, which includes surgeons, physicians, and generally those who practise what we

call a liberal profession, are obliged to content themselves with one sample of that favourite weapon. Their soldiers for the two last centuries have fortunately had little occasion to try its edge, but they, in common with the great mass of the classes who wear it, are said to be tremendously expert in its use. The manufacture of the article is also brought to a degree of excellence which Damascus itself in its best days could hardly surpass, and which Birmingham may despair to equal. This may be judged of from specimens in the museum of the Hague. If the Turk boast of being able to cut off the head of a camel with this two-handed engine, it is said that the Japanese professors can divide a fellow-creature through the middle at a blow. A favourite weapon is preserved as an heir-loom for ages, and a good one on sale frequently reaches the price of a thousand florins, or little short of a hundred pounds. This weapon is regarded with a kind of superstitious reverence. It is the constant companion of every individual of the classes entitled to wear it, even from his fifth year, when the Japanese youth is solemnly invested with it. When laid aside at meals or on other domestic occasions, it is always deposited close to the person of the owner, and he is careful neither to stumble against nor step over it. Fencing, the manège, and archery, are a part of the education of the upper classes, and in the latter they excel. With respect to "other appliances of war," they are said to have acquired little knowledge or use of artillery, previous to the general pacification of the empire, and little advance can have been since made in the art of the gunner, the engineer, or the tactician. Their fortified defences are hence far superior to any means of attack, which, in the event of renewed civil war, could be brought against them. The specimens of their arms which the Dutch have found means to export have been so obtained in evasion of a strict prohibitory law. The museum at the Hague contains a very fine suit of mail, with a vizor or mask of steel, the exact resemblance of the face of a Punchinello, and adorned with mustachios of bristles. We have seen another such in a museum at St. Petersburg. The barrels of their fire-arms are of equal excellence and beauty, but they are all matchlocks; their powder is very indifferent.

From our author's accounts we should rank the Japanese among the

> "Souls made of fire and children of the sun,
> With whom revenge is virtue."

Forgiveness of an injury Mr. Meylan asserts to be unknown, or only known to be stigmatized as a weakness or a sin. Of their courage it would be hard to speak, the article not having been tested on a large scale for two centuries. Mr. Meylan states, that in the armies of the infant Dutch East India Company were many Japanese soldiers, who did excellent service, and he believes them to be far braver than the other nations of the East. Suicide is frequent; and the duellist of Europe, however desperate, is far excelled, in our judgment, by the Japanese, who, in the presence of applauding, and frequently imitating relations and friends, rips up his own abdomen to escape dishonour. This was the conduct and fate of the governor of Nagasaki in 1808, when an English frigate found an entrance into that harbour, detained as prisoners the Dutch who boarded her, and demanded—in that ignorant and wanton violation of the religious law of the country which we regret to say so often marks the conduct of British adventurers—fresh beef as their ransom. The beef was supplied, but the governor, as soon as the Dutch under his protection were relanded, anticipated disgrace and ruin by the suicidal process above mentioned, and, as we have heard, others of his house swelled the sacrifice. We cannot too seriously inculcate upon our countrymen the folly and injustice of which they are too often guilty in endeavouring to subject the nations they happen to visit to their own very peculiar habits and practice. Mr. Meylan concludes that, in the case referred to, the governor deemed himself too weak to attack the vessel. It is certain that he was taken by surprise, for access to the harbour for a ship without a pilot is considered next to impossible, and the Dutch annual vessel is always towed in by native boats. We have heard, however, that the English captain, warned of his danger by the Dutch whom he had thus unjustifiably detained, only escaped in time, for that within a few hours fourteen thousand armed men were mustered on the coast, and that more than a hundred junks had been collected for the purpose of being sunk in the only channel by which the frigate could regain the open sea.

Among the better features of the Japanese character, that of filial piety appears to be the most conspicuous. The domestic virtues of the women are also highly extolled. In virtue of one of those laws established by the stronger party, while the man is allowed concubines *ad libitum*, adultery in the female is punished with death; but it is not for chastity alone, thus terribly enforced, that the Japanese wives are praised by Mr. Fischer, but also for their patience and ability as managers in households, which the pride of the husbands, rejecting all means of livelihood but the employment to which they have succeeded by birth, frequently reduces to extreme difficulty. For the rest, the station of the female in Japan is that which is allotted to her in Europe. She presides at the feast and adorns the social meeting. The samsie or guitar is even more invariably a part of female education than the piano in England; its touch is the signal for laying aside ceremony and constraint—and tea, sakki,* and good fellowship, become the order of the evening.

If we assume the perfection of the arts of tillage and manufacture as a test of civilisation, Japan may at least compete with any oriental nation. Mr. Meylan places it higher than any. He extols their field cultivation, but they appear to neglect their great opportunities for horticulture, as far as the kitchen and the dessert are concerned. As florists they are conspicuous, and the beauty of the productions of the soil in this department is known to every possessor of a greenhouse, and

* A spirit distilled from rice, the principal or only intoxicating beverage of Japan.

proprietor of a camelia. The singular art of producing miniature samples of the larger products of vegetation, unknown, we believe, in Europe, is practised by them to an extraordinary degree.* Mr. Meylan speaks as an eye-witness of a box offered for sale to the Dutch governor, three inches long by one wide, in which were flourishing a fir-tree, a bamboo, and a plum-tree, the latter in blossom. The price demanded was twelve hundred florins. Sharing with the Indian the religious prejudice against the slaughter of the cattle tribes, and indeed against the use of butcher's meat in general, pasturage and all its products they totally neglect; but the buffalo is used for tasks of burthen, and when it dies a natural death, its horns and hide are applied to the purposes usual among other nations. This perhaps is the source of the degradation in which the tanners are held. They have an aversion to fat or grease, which strongly distinguishes their cookery from that of the Chinese, and we may add the Tartar family in Europe. Poultry is much cultivated; pheasants and various sorts of game afford the squires of Japan ample occupation in their pursuit. The staple of their animal food, however, is afforded by their seas and rivers; and every product of both, says Mr. Meylan, from the whale to the cockle, is turned to account, down even to the whalebone itself, which is scraped and powdered into a ragout. This dish, as well as the raw dolphin, eaten with soy, sakki, and mustard, although Mr. Fischer speaks favourably of it, we can spare without envy to the Japanese, and the gentlemen of the factory. The stork, a bird which somehow has contrived to ingratiate itself with a large portion of the human race, for its domestic habits and services, and general social character, is respected here as in Holland and Calcutta.

"In a memorandum," says Mr. Meylan, "laid before the Dutch governor-general at Batavia, in 1744, is contained a calculation, from which it appears that at the beginning of the seventeenth century, when the trade with Japan was an open one, the export of gold and silver was ten millions of Dutch florins per annum," (about 840,000*l.*) This export was first contracted, and in 1680 finally forbidden. The same calculation goes on to say, that in the course of sixty years, the export of gold and silver must have amounted to the enormous value of from three to six hundred millions (from twenty-five to fifty millions sterling). If we consider that, in addition to this gold and silver, Japan produces a large quantity of copper, of which the Dutch have in some years carried off from thirty to forty thousand pekuls;† and if we add to this a large quantity of steel and iron; but above all, that all these metals are every where esteemed for their high degree of purity; we must conclude that the Japanese are not altogether unskilled in the arts of the miner, the smelter, and the refiner. They appear, however, to be open to the imputation of working their mines in a careless and extravagant manner, and are believed now to have reduced them to a state of great exhaustion. This circumstance is said to have been made use of by a pretended friend to the Dutch, in the councils of the koeboe, to bring about the limitation of their trade in 1790. "The cause of our friendship with the Hollanders," said he, "is trade, and the trade is supported by copper. If the one be exhausted, the other must fail. Is it not wise, then, to perpetuate our friendship by allowing only so much copper to be issued as our mines may be able for ever to afford? The mines are not like the hair of men, which being cut off groweth again, but, on the contrary, resemble his bones, which, if taken away, cannot be replaced." These arguments produced a restriction from two annual ships to one, which, however, in 1820, was mitigated, and the number of vessels and amount of copper again increased. In addition to the national manufactures, for many of which Japan has been long so famous with us, and one of which bears the name of the empire that furnishes it, the Japanese now imitate many of the finer works of European skill: telescopes, thermometers, and clocks, are manufactured at Nagasaki. One of the latter, by the description of Mr. Meylan, manufactured there as a present for the emperor, in 1827, must have rivaled those complicated productions of German chronometrical art, which usually tell us every thing but the hour. It was five feet in length, and three high; it exhibited a varied landscape, and a golden sun; on the striking of the hour a bird clapped its wings, a mouse issued from a cave and climbed the mountain, a tortoise crept forward to point the hour on the dial. Alas! that the bird should, with oriental inattention to perspective and proportion, have been bigger than the tree on which it sat! Alas! that the mouse should have climbed in an instant the representative of a mountain many thousand feet high!

Of the art of design as practised among them Mr. Fischer observes:—

"This art appears to have developed itself, to a certain degree, in very early times. Many screens and decorated walls in their temples bear the marks of remote antiquity, although it is hardly possible to ascribe any of them, as do the Japanese, to the eleventh century.

"I have never heard of a good portrait painter in Japan, and am of opinion that a reluctance exists among their artists to devote themselves to this branch of their profession, founded on superstitious feelings. In all such works their attention is principally directed to accuracy in the details of costume and general air; the face is never a likeness."

Their Tartar brethren of St. Petersburg, whose criticism on the noble portrait of Alexander, by Lawrence, was first directed to the great painter's delineation of his imperial majesty's epaulettes, crosses, and ribbons, displayed similar feelings with respect to the fine arts.

The illustrations of Mr. Fischer's book, all copied from the productions of artists at Nagasaki, would alone be sufficient to prove that their painters are enabled to give their works much of that exquisite beauty of finish which delights the Dibdins in our illuminated missals, the offspring of monkish leisure. Of their lacquered ware, which

* For the mode of effecting this as practised in China, the reader may consult an interesting work lately published—"Wanderings in New South Wales, &c." by G. Bennet, vol. ii. chap. 5.

† The pekul is about 133lbs.

bears with us the name of the country that produces it, we need only say that the specimens which reach Europe are rarely such as would be considered of any thing but very inferior quality in Japan. The royal collection at the Hague bears witness equally to the dexterity of their artisans in many various departments. We remember observing, that the common chests which had been used to pack the articles for conveyance to Europe, and made of camphor wood, were equal in the finish of their execution to the finer cabinet work of the Gillows and Morells of London.

Theatrical entertainments are much followed, and they are far superior to those of the Chinese in respect to scenery and decorations. Their plays admit a Shakspearian mixture of the tragic and comic in the same piece, and an equally licentious—as the old French school would say—violation of the unities.

"Their leaders of the orchestra," says Mr. Fischer "if they deserve the name, are usually blind. They belong to a certain union or fraternity of blind persons, who bear the name of Fekis."

The founder of this society, tradition says, was a Prince Senmimar, who wept away his sight for the loss of a mistress. There is, however, another equally romantic version. Their theatres are much frequented, but the player's profession lies under that disrepute to which the irregularities of conduct incident to his mode of life have more or less condemned it in most countries, and from which the talents and virtues of many of its members have been insufficient among us fully to rescue it. The Japanese ladies take an advantage of the opportunities for display afforded by a side-box, which we suggest to the milliners of London and their fair cutsomers, as worthy of introduction during the opera season.

"The ladies," says Mr. Fischer, "who frequent the theatre, make a point of changing their dresses two or three times during the representation, in order to display the richness of their wardrobe; and are always attended by servants who carry the necessary articles of dress for the purpose."

Printed programmes of the piece under representation are always in circulation, and we doubt not that a Japanese playgoer, descending from his *norimon* at the box entrance, for they have three tiers, is saluted with an invitation to buy a book of the play, which Mr. Mathews, if he could once hear it, would imitate with his usual ludicrous fidelity.

They are altogether a gay and social people, and their somewhat cumbrous modes of politeness, and their addiction to compliment, appear but to promote good fellowship. Witness this description of Mr. Fischer:—

"In the great world the young ladies find delight at their social meetings in every description of fine work, the fabrication of pretty boxes, artificial flowers, birds and other animals, pocket-books, purses, plaiting thread for the head-dress, all for the favourite use of giving as presents. Such employment are in use to wile away the long winter evenings. In the spring, on the other hand, they participate with eagerness in all kinds of out-door and rural amusements. Of these the choicest are afforded by the pleasure-boats, which, adorned with the utmost cost and beauty, cover their lakes and rivers. In the enjoyment of society and music they glide in these vessels from noon till late in the night, realising the rapturous strain of the author of Lalla Rookh:—

Oh best of delights as it every where is,
To be near the loved one, what a rapture is his,
Who by moonlight and music thus idly may glide
O'er the lake of Cashmere with that one by his side!"

Mr. Moore will be pleased to find that his music has charms even for the Batavian exiles of Decima.

"This," continues his admirer, "is an enjoyment which can only be shared under the advantages of such a climate and scenery: viz. the climate of Nice and the scenery of Lugano. Their lakes and rivers are after sunset one blaze of illumination, as it were, with the brightly coloured paper lanterns displayed in their vessels. They play, meanwhile, that game with the fingers, which has been perpetuated from classic times in Italy. A floating figure is also placed in a vase of water; as the water is stirred by the motion of the boat, the figure moves. The guests sing to the guitar the strain "Anatoya, modamada," "He floats, he is not still," till at last the puppet rests opposite some one of the party whom it sentences to drain the sakki bowl, as the pleasing forfeit of the game. All this stands out in cheerful contrast to the dull debaucheries of the men, and the childish diversions of the women, among other oriental nations. The female sex, at least, have greatly the advantage over the scandal of the Turkish bath; and the man has equally with the Turk the resource of his pipe, in the intervals of those better enjoyments which the admission of the female sex into society afford him, and which are prohibited to the Musulman."

Foreign commerce being forbidden, their vessels are limited by law to such a construction as suits a coasting voyage, and necessitates them to run for one of their numerous harbours on the appearance of bad weather. The largest are described by Mr. Fischer as about one hundred Dutch feet in length, from twenty-five or thirty beam, and drawing six feet of water. Mr. Gutzlaf reports that he saw three Japanese barks lying in the harbour of Loo Choo, whose crews were anxious for communication with the strangers, which was only prevented by the mandarins of the island. It is probable that these islands and the coasts of the inhospitable Yesso are the usual limit of their navigation. Although, however, that navigation be by law confined to their own coasts, or a few islands not far distant, voyages of discovery have occasionally taken place by express command of the emperor. It appears from Valentyn's work (vol. v. part 2, p. 20), that, in the year 1686, a junk having sailed on such a voyage to the eastward, returned, after long absence, to Nagasaki. Its navigators would appear to have entertained a notion that he had reached the coast of New Holland, for hearing that, among the servants of the Dutch factory, there were some who had been born there, he sought for and interrogated them as to the manners and appearance of the natives. The parties could but imperfectly understand each other, but it was gathered from the Japanese captain's narration, that after sailing for many days eastward, and finding the sea still open, he had determined to put about. A storm, however, drove him farther on his original course,

till he reached a land, which his description led the Dutch to conclude to have been the coast of America, between the 40th and 50th degrees of north latitude. This is the last enterprise of the kind on record. We should like to see the Memoirs of some Japanese Basil Hall, who should have discovered the mouths of the Seine and Thames, and given some account of the barbarians who inhabit those distant regions.

Corea, a country far less known to us at present than Japan, was once under the acknowledged dominion of the latter. That dominion having fallen into abeyance during the Japanese civil wars, was reclaimed towards the end of the sixteenth century, but appears now reduced to some slight relations of commercial intercourse and feudal tribute. Tsusima, an island situated midway between the two countries, has a Japanese garrison; and it is there that the ambassadors of Corea are received, on the occasion of the accession of a new sovereign to the throne of Japan. Mr. Fischer had opportunities of seeing at Nagasaki some of the Corean barks which are occasionally driven on the southern coast of Japan. He describes the appearance of their crews, and the construction of their vessels, as indicative of a very low state of civilisation. The state of this country, and that of Yesso, is well calculated to confirm the Japanese in the notion of their superiority over other nations. The latter island was partially subdued in the year 1443, and was then nominally divided into provinces, but the interior has probably never been penetrated. It is tenanted by a hunting population, and, extending northwards into Kamschatkadale latitudes, is wrapt in Cimmerian barbarism. It appears to form a link of occasional communication with the Kurile islands under the dominion of Russia. It was to the principal commercial establishment on this island, Matzmai, that the Russian captain, Golovnin, was conveyed a prisoner in 1811. He was not liberated till full and formal satisfaction was obtained under the seal of the governor of Irkutzk, disavowing the proceedings of the Russian lieutenant, Chowstoff, who had committed some acts of plunder and incendiarism on the Japanese coast of Segalien. The Dutch assert that to the strangers in general whom stress of weather or obvious accident drives upon their coast, the Japanese show every hospitality consistent with a strict surveillance during their necessary stay and the facilitation of their departure. Mr. Gutzlaf is certainly right in stating, that, though the good will of China might open a wild field of eastern commerce to Great Britain in Loo Choo, Corea, and Cochin China, their consent would be no passport to Japan. Such an approximation could, in fact, only increase the jealousy of the latter, and would perhaps occasion the final exclusion of the Dutch.

The works of our authors being inaccessible to the generality of English readers, we regret the more that we can give but a brief notice of their remarks on the literature and scientific progress of the Japanese. Mr. Fischer has himself done much for future knowledge in the particular of their language, in recovering the traces of a work, the produce of long labour during the period when the war with England had cut off the Dutch residents from intercourse with Europe. We allude to the Dictionary of Mr. Doef, prepared with the permission of the Japanese government, and the assistance of ten native interpreters. This circumstance is the more remarkable, as the study of the Japanese language is generally forbidden to foreigners. A perfect copy was lost on the voyage to Europe; another exists, much prized and honoured, in the imperial library at Jeddo. Mr. Fischer, however, in 1822, discovered at Decima the original notes, and in 1829 had finished the work of restoration. We shall be glad to hear of its safe arrival in Europe.

Astronomy, or at least the inspection of the heavenly bodies and their movements, is, as usual with nations residing under a clear atmosphere, much pursued. Whether they have profited by their intercourse with Dutch literature, so far as to adopt a correct system of the science, Mr. Fischer does not state, but they are familiar with our chronometers, telescopes, and other instruments of observation, and measure their mountains with the barometer. In medicine their proficiency is small, and their prejudices forbid the study of anatomy. We have, however, condescended to borrow from them the use of the moxa, and, as we believe, the practice of acu-puncturation. Education, such as it is, is extended in public schools to all classes, and in no country in the world, perhaps, is the art of writing so universally diffused. It is strange that a nation which possesses over the Chinese the inestimable advantage of an alphabet, should waste time in the study of the language of those neighbours, considering it as the learned one. They are great collectors of articles of rarity, both natural and artifical, and their dilettanti rival our own in their pursuits of coins and pictures. The governor of the province of Tamba possesses a fine collection of European coins, and, in Jeddo, Mr. Fischer saw a collection of old European engravings, which had been preserved one hundred and fifty years in the family of the proprietor. Their museums contain many specimens of factitious monsters, mermen, serpents with the feet of birds attached, &c. One of the said monsters, made up of a salmon and a monkey, was not long since exhibited as a "a merman" in Piccadilly. Their taste in jewellery extends only to the metals, and their precious stones are rarely polished, or applied to the purpose of ornament or exchange.

There are at present, as Mr. Fischer informs us, but eight of his countrymen living who have personally visited the capital of this vast empire. We have already observed that the strict adherence of the Japanese government to precedent and usage, with respect to the quadrennial embassy from the Dutch factory to Jeddo, makes each visit a mere repetition of the former; and the circle of ceremony and precaution, which ever surrounds the travellers, allows, to the most acute, little means of adding to the observations of his predecessors. Some extracts, however, from Mr. Fischer's Narrative of his Fifty Days' Journey may not be unwelcome to our readers. We must premise that the embassy took place in the year 1822, and consisted of the Dutch presi-

dent of the factory, M. J. Cock Blomhoof, our author, who accompanied it as secretary, and Dr. Tullingh, physician to the factory. They started on the 6th of February, attended, as usual, by an *opper banjoost*, or superior Japanese officer, with three subordinates, three interpreters of different ranks, and a train of baggage-bearers, amounting to about one hundred men, and twenty horses; the latter being principally loaded with the bedding of the persons of rank, who themselves travelled in the easy and convenient litters of the country, called norimons. Additional baggage and provisions, not wanted for immediate use, were sent forward some days before, by sea, as far as Osacca on the principal island. The embassy was constantly preceded by two Japanese cooks, one to prepare the dinner at some convenient point of the day's progress, the other the supper at the resting-place for the night.

"On the 8th," says Mr. Fischer, "at Sinogi, we visited the hut of an old man, who from his youth had taken delight in beholding the passage of the Dutch. He was nearly ninety, and had seen our countrymen pass by upwards of forty times, and seemed to think himself fortunate in having lived to witness the transit of another embassy."

They reached, on the 12th, Kehura, a sea-port town on the channel which separates the great island of Nipon from that on which Nagasaki is situated, and distant about 180 miles from the latter city. They crossed, on the 13th, to Simineseky, the westernmost point of Nipon; from which, after waiting till the 22d for a favourable wind, they pursued their voyage along the coast eastward, for 117 miles, to the city of Moero, where they landed. After passing through many great and populous towns, among others Osacca, where, however, the press of the curious and the enforcement of etiquette prevented them from leaving their litters to make their observations on foot, as they wished, they reached, on the 7th of March, Foegimie, the last stage preceding Miako, the residence of the spiritual emperor.

"From Foegimie," says Mr. Fischer, "to Miako, a distance of two leagues, we passed through a continuous street of shops and manufactories. The magazines of earthenware, of grain, of game, and poultry, the tea-houses, sakki breweries, &c. are not to be numbered; and the animation caused by the crowd of passengers made this part of our journey most interesting. In Miako we were better lodged than in Osacca, and received an equally interminable number of visits. Miako, sometimes called Kioto, is the seat of the dayrie, and is computed to contain 600,000 inhabitants. The temples are beautiful: as well as the aspect of the river, which flows through the city, and the fertile environs. The women of this place are accounted the handsomest of the empire; and the arts and sciences are held in the first estimation. It is the place of rendezvous for strangers from all parts of the empire, who flock to it for the purpose of pilgrimage to the temple of Tsie, or to make their provision of the manufactures of the place. It is accounted the paradise of Japan, and specially famed for its salubrity."

The travellers appear to have been treated with respect by all whom they encountered on the road, and generally at their halting-places with the cordial and good-humoured hospitality which attends a welcome guest. The access of numerous visiters seems to have been no where impeded by any jealousy on the part of the government. In some places their entertainment was of a particularly affectionate description.

"On the 20th," says Mr. Fischer, "our journey lay through a very hilly district, and the ways were steep and difficult. The traveller is more agreeably surprised to find, in this fatiguing part of his course, resting-places, from which damsels, as amiable as they are comely, run forth to offer him spring-water, tea, and other refreshments, and to compel him to a few moments of repose in their abodes. We halted on the mountain in one of those tea-houses, where the privileges common to other travellers fell to our lot; and could not but concede to our Japanese friends, that the reputation of the fair sex for beauty in this district was fully borne out. Reason enough, here as usually, to grace our fair entertainers with the souvenir of a ring, a hair-pin, or other trifle. It is from this place that we obtain the first view of the renowned Fozie mountain, which raises its snow-clad summit above its fellows, and hides it in the clouds."

This mountain is elsewhere described as between 11,000 and 12,000 French feet in altitude, and as a volcano which has been for not more than a century quiescent. It is held in great affection by the Japanese, and constantly figures in the works of their artists and the pages of their poets and romance-writers; a distinction well merited by the beauty of its scenery and the fertility of its environs.

The embassy, which had left Nagasaki on the 6th of February, on the 27th of March reached Sinagawa, the Kensington or Kentish Town of the Japanese capital; which reminds the author, by the animation of its streets, and the multitude and splendour of its shops, of London.

"Long before we reached Sinagawa, we advanced, through the press of a crowded population, along broad streets, which may all be considered as belonging to Jeddo; and our progress to our resting-place occupied about two hours, at a steady and rapid pace. Nagasak-kya, the place appointed for our lodging, is situated close to the imperial palace, which forms the centre of the city. The diameter of the latter may be reckoned at from five to six leagues in extent."

Once arrived here, the travellers found themselves much in the situation of state-prisoners—permitted, indeed, to receive official visits, but allowed to issue from their residence only on the occasion of their audience of the emperor, and surrounded in their abode by spies in various shapes and disguises. Among these visiters were some who understood Dutch—viz. the imperial under-interpreter, several physicians, and the imperial astrologer, who rejoiced in the apposite name of Globius. These eagerly availed themselves of the opportunity afforded them for obtaining scraps of European information, and the strangers doubtless equally laboured to increase their knowledge of Japan. This intercourse with the natives, although under constant supervision and regulation on the part of the government, was so far unrestrained, that the lodging of the embassy was usually crowded with guests till a late hour of the night; and though the letter of the Japanese law forbade the female sex to enter its precincts, that ingenuity of curiosity which in

England has penetrated behind the throne in the house of peers, and insinuated itself into the ventilator of the commons, triumphed equally at Jeddo. It sometimes happened that a single male visiter came attended by six ladies—a circumstance which Mr. Fischer states by no means tended to protract the consumption of certain stores of liqueurs and confectionary which such occasions brought into play. Presents were interchanged according to the rank of the parties. A Dutch word or two written on the fan, as a substitute for an album, satisfied many of small pretensions. The secretaries of the government of Sadsuma brought an offering of twelve beautiful birds, fifteen rare plants, two lapdogs, two rabbits, with silks and other articles, conveyed in cages and cases which in value and beauty far exceeded their contents.

On the 6th of April, the great purpose of the mission was accomplished in the formal audience —to which the head of the embassy alone is admitted—of the emperor. The president is, however, attended to the threshold of sovereignty by his two European companions. After entering the palace, and waiting for an hour in a saloon, where they were exposed to the only circumstances savouring of impertinence or insult of which Mr. Fischer has, in his entire narrative, to complain, they entered the hall of audience, which he thus describes:—

"It is very large, but simple, and without pomp of decoration. They pointed out to us, facing the entrance, an elevated spot destined for the appearance of the emperor; on its left hand, the places for the princes of the blood, and the imperial councillors, according to their rank. Although every part of the palace, seen by us, is remarkable for elaborate and beautiful construction, as well as for a general air of grandeur in comparison with other buildings, this part of it is too particularly set apart for public occasions to allow of much display of pomp and luxury. The proportions of the doors and shutters are colossal, and the Japan work, gilding, and carving, rich, yet simple. When we returned to the ante-chamber a heavy storm arose, which fortunately lasted but for a moment, as otherwise the audience would probably have been postponed, seeing that his imperial majesty has a great dread of thunder. At eleven o'clock the president was summoned to his audience, from which he returned in about half an hour. The whole ceremony consisted in his making his compliment in the Japanese fashion from the spot appointed, and remaining, for a few seconds, with his head bowed to the matted floor, till the words "Capitan Hollanda" were cried aloud. A deep silence reigned, only interrupted by a gentle murmur, with which the Japanese express profound reverence. The governor of Nagasaki, and the chief interpreter, were the only persons who accompanied the president, and gave him the signal of permission to depart, which is effected, like his entrance, in an inclined posture, so that the party is aware indeed of the presence of a number of persons, but without violating the rules of Japanese politeness, cannot look about him, or indulge his curiosity as to surrounding objects which might deserve it."

On the whole, though occasionally oppressed with visits, and once exposed to a scientific examination from a whole faculty of royal astrologers (as was the physician of the embassy to a five hours' interrogatory from sixteen of his brother professors), Mr. Fischer speaks in the highest terms of the kindness and hospitality with which he was treated during his stay at Jeddo. Some of his friends put his risible faculties to the test by the compliment of appearing at his quarters in Dutch apparel, of ancient and various date and fashion.

We wish we could afford more of our pages to this remote and remarkable people; but for the present we must stop. We leave them to the complacent enjoyment of the conviction, that they are the first of nations, and the eldest descendants of the Deity. We leave them satisfied of their absolute and universal excellence, wanting no change—"least of all, such change as we could give them,"—and tenacious of the maxim, "that the commands of their emperor are like the sweat of man's body, which once exuded, returns not again to its source;" and we only further subjoin the well-balanced summary of their character with which Mr. Meylan closes his interesting volume:—"Cunning, polite, suspicious, reserved, sensual, impatient, haughty, superstitious, revengeful, cruel in cold blood, on the one side; on the other, just and honest, patriotic, exemplary in the relations of parent and child, firm friends, and *probably* not deficient in courage."

NAPOLEON AND THE TYROLESE.—During the campaign of 1809 Napoleon arrived at Brünn, in Moravia. He had to pass the Old Gate: a steep ascent leads to this gate, contiguous to which stand several houses. One of these houses was occupied by a mechanic, as a dwelling and workshop. Among his journeymen there was a native of Tyrol, an industrious and worthy fellow, but, like all his countrymen, a furious enemy to Napoleon and the French. On the morning that the Emperor rode to the Spielderg, the Tyrolese was missing. His comrades were just talking of him, when the apprentice entered the shop, and mentioned that he had seen the Tyrolese at the window of the loft. This awakened curiosity, and the master went up to the loft to look after the man. There he found him kneeling at the window, with a gun ready cocked lying before him, and his eyes fixed on the road by which Napoleon must necessarily pass. As the house stood on the declivity of the hill, consequently lower than the gate, the Emperor on horseback, at the moment when he came up to the gate, would have been nearly on a line with the window where his humble foe had posted himself; and the distance would have been so small, that scarcely any marksman, and least of all a Tyrolese, could have missed his aim. A few minutes after the master had disarmed his workman, Napoleon passed the gate, and rode down the hill.

ADA BYRON, the only living offspring of the illustrious poet, though scarcely fourteen, inherits, it is said, the genius of her father, and has written a wild dramatic romance which lately appeared at the Victoria Theatre. She is also about publishing a five act tragedy, called the "Deceived One, or the Fate of Geraldine."

THE EXPERIENCES OF RICHARD TAYLOR, ESQ., OR, LIFE IN LONDON.*

CHAP. IV.

YOUNG MRS. ROBERTS'S THREE CHRISTMAS DINNERS.

Though an old bachelor myself, I have always had a fancy for visiting new-married people. I cannot, however, pretend that I have been able to approve of above half the unions my young friends are pleased to form. But whether I approved the marriage or not, where I liked the parties, and the deed was done, I have always found it pleasant to visit them, as soon as the first blush of the affair was past, and the sober household-moon rising over that of honey, or of treacle and butter. I like to look upon the first home, however humble, in which the young bride has shrined so many fond hopes; and to witness the effects of the heart-taught taste, which has adorned her bower in the brick and mortar wilderness. Then there are to be seen the little tokens of the affection and good-will of distant friends, which surround her like trophies and tributes. There is, too, the indescribable flutter of a vanity, now first divided between her own pretty person, decked in its bridal garniture, and her pretty sofas and window hangings; both repressed by the matronly dignity of a woman to whom belongs, of sole right, a certain number of silver spoons and china cups and saucers, and the whole consolidated by the awful responsibility of her who bears three small *keys of office*, and has a six inch account book, "to chronicle small beer," locked in a new rosewood eighteen inches desk, and who, you see by her face, nobly resolves to do her duty, as becomes a married woman, who has to spend money, and keep house for herself and another. There may be and there are many giddy-headed, shallow-hearted creatures, who feel all the vanity, with none of the tremendous responsibility of this condition. My business, at present, is not with them.

It was my good fortune, in 1821, to pay my devoirs to three newly married women, on one frosty October morning: one of them in humble life, the two others in what is called the middle rank of society. Of these marriages I had heartily approved one,—that of my friend Joseph Greene; while I was doubtful of Mr. George Roberts's matrimony, and had openly disapproved, and so far as my advice went, opposed the wedding of Sally Owen. This Welsh girl was educated in a public charity; and, from ten years old to eighteen, lived first as an apprentice, and then a voluntary servant, under the same roof with myself, enjoying in her early discipline the vigilant superintendence of notable Nurse Wilks. From our abode she went into a better, that is to say, a more lucrative service; but our house she considered her home —her rendezvous on *her day-out*, and in all seasons of trial and difficulty. While with us, Sally was chiefly noticeable as a well-tempered, industrious girl, who cheerily scrubbed and dusted all day, and sang like a lark, "Far beyond the mountains," and other Welsh airs. In her new service she became more prudent and less girlish, which increased my concern when she came formally to announce her marriage. No folly that girls like her can possibly commit in the way of matrimony, will ever excite my surprise. Her intended husband was a boot-maker. He could make his couple of guineas a week, *if he liked to keep steady;* and needed never be out of employment *if he chose to work. Ifs* and *buts* spoil many a good charter: and it proved so with Sally Owen, who wept all night over my warnings and Nurse Wilks's scolding prophecies, and married in the morning in very tolerable spirits.

This was all past by two months or more, and I visited her tidy single room, not to hear more of her husband's faults, but much better pleased to listen to her shy praise of his kindness and *steadiness;* and that in one week he had earned fifty shillings! and placed it in her hand. I hoped she would take care of it, and so with good wishes embodying good advice, I left my compliments for Mr. Hardy, the extraordinary boot-maker, who could work miracles when he liked; and placed my gift of Franklin's life on a little rack above Sally's drawers.

Joseph Greene was a member of the Society of Friends. He was the eldest son of my old friend Joseph Greene, the draper, to whose long established business he had lately succeeded. About the same time a courtship, if such it might be called, of some three or four years' duration, had been brought to a close by Joseph marrying, with the full approbation of all concerned, the eldest daughter of a cloth manufacturer in Yorkshire, who I need not say was a member of the same society. The fair quaker I found endowed with a competent share of the comely and intelligent looks which distinguish the females of her beneficent sect. I was pleased with her manners, her conversation, her comfortable and well arranged abode; pleased, but not yet particularly interested, nor in the least charmed. Perhaps, I was too late of paying my marriage visit to this serenely sensible person, who, for aught that I saw, might have been married for seven years.

So far as human beings may dare to calculate on the course of human events, it was clear that this was to be a *soberly* happy couple, and theirs a flourishing household, established on the sure basis of prudence, mutual esteem, rational affection, competence of the means of a moderate life, perhaps a little romantic *love* also, though for this last I cannot swear; but certainly with a deep and holy sense of the duties and claims of the condition upon which they had deliberately entered, obtained by the discipline of a life, and enforced by the customs of their sect, and the sanctions of their peculiar institutions. Chance had thrown my third bride into the next door of the neat row of new houses, one of which, while their house was building, formed the temporary abode of Joseph and Rachel Greene. She was now the two months' wife of Mr. George Roberts, my brother's confidential clerk, whom I had known from a foolish boy,—who had, indeed, grown up with and among us. He was now neither a fool nor a boy; he was instead a sensible, and singularly acute fellow, above thirty; yet it had pleased him to fall in love, in the previous month of July, with a very pretty young woman, a governess in a school at Hastings, to whom he had carried a letter, and whom he had seen afterwards at church, and met two or three times during his sea-side sojourn. My brother and his wife, to whom Roberts was more than an ordinary *attaché*, thought the thing a more "foolish affair" than they might have done some twenty years before; but Roberts had certainly a right to please himself,—which he did, by marrying at Michaelmas, and laying out his savings, and a little more, in furnishing smartly the house next door, as I have said, to Joseph Greene. He insisted that I should come to see, he did not exactly say, admire *his* wife and *his* house; and I complied willingly. I had already seen her at a party given by my sister, in honour of "the foolish marriage." She was a lively, and almost a handsome, black-eyed girl, about twenty; and if not what ladies would allow to be a fashionable looking, she was at least showy and dressy; vain enough quite, and occasionally affected in her manners, though not yet wholly encrusted with either the scruf sugar-work or frost-work of an incurable affectation. Although the assumed fine *personage* would rise, and obtrusively come between one and the natural lady, it was not yet difficult to doff the shadow aside and come at the true woman.

* Continued from Museum for January, 1835, p. 75.

Mrs. George Roberts, like, I fear, ten thousand others of my countrywomen, had married with little more knowledge of the duties of her new condition, than belonged to the marriage dresses, the cake and cards, her ring, at which she glanced fifty times by the hour, her bracelets and combs, and the other paraphernalia of her rank and state. Yet there was occasionally that about her which did not show a woman to whom nature had denied either heart or mind, and I hoped she had fallen into tolerably good hands.

In those digital acquirements, named accomplishments, young Mrs. Roberts was no mean proficient. She also read French, and a little Italian, and had a natural talent for music, and, moreover, an ill-toned brass-mounted new cabinet piano-forte, which formed the principal ornament of the small drawing-room, into which I was ushered, by a fluttering girl in a wedding cap and top-knot. It was a temple worthy of the goddess; yet the general effect at this time, while every thing wore the gloss and freshness of novelty, was airy, and so to speak, *tasteful—French*, or Anglo-Gallican: and I suppressed the cynical idea, forced by an involuntary comparison of this apartment, with Rachel Greene's roomy bed-chamber, on the other side of the party-wall,—and the question, "How will all these *flimsies* look two years hence, —mistress included?" At present all was glittering, if not golden; and "brightly blue" muslin draperies, coarse gilding and lacker, and spider-limbed, crazy jointed chairs and sofas,—painted, and varnished imitations of expensive woods,—made up the inventory, and—all obtained prodigious bargains!

"As we can't afford to give many dinner parties, it don't much signify for the dining-parlour," said George, with the prudent air so becoming in a young husband. "And as we have only a limited sum to lay out in furniture, we have made any thing do for the family room down stairs, to have this one nice for Maria's little parties."

"But where the deuce are you to sleep?—This is your neighbour Greene's chamber through the wall there. Is your house larger?"

"Self-same every way—but the Greenes have no drawing-room—there is a very good small antechamber —what signifies where people sleep?"

"Then this is the *show-room*. It really looks pretty to-day—*humph*."

"It was so good of Mr. Roberts to leave the decorating of this apartment to myself," said the bride. "I so love a bright, delicate, pale, but not too pale, blue." We all looked around us admiringly at chairs, and squabs, and pillows, all "beautifully, brightly blue," and at the flowered muslin curtains, bordered with blue, and at every thing festooned with bunches of "bonny blue ribbons," even to Maria's dark hair. On her varnished work-table, with its blue silk bag, were blue bell-ropes, the twisting and twining of which formed her present employment. On other tables were volumes of neatly bound little books, and vases of artificial flowers, and cards of wedding guests; and the chimney-piece, was profuse of "ladies' work," in its numerous conceits, and flimsy varieties. But the most striking, and to me the most provoking part of the details, was the small portable grate, placed within a large new, bronzed, and lackered one, in which smouldered and smoked a few small coal, contrasting dismally with the clear-burning fire and cheerful fireside, I had, on this chill, lowering day, left in the next house. I am not yet done with these details. Upon the spider-legged work-table, which a puff of air might have overturned, lay the lady's cambric-laced pocket handkerchief, bordered by her nicely clean French gloves, which had been taken off, that she might prosecute the bell-pull industry; and on the handkerchief, a very pretty purse made of gold and purple twist, with a *rich* clasp and tassel; half-sovereigns and sixpences glancing brightly through, ready to start forth, prompt to do the hests of the fair owner as long as they lasted. I had no right nor wish to be *sulky*, nor yet to anticipate evil. There was nothing positively wrong, though there might be indications of excess of right. There certainly was nothing irreclaimable, nothing that a year's *tear and wear*, with its attendant experience, might not rectify. My friend George was so evidently delighted and charmed with his wife, his house, his domestic happiness and good fortune, that I could not be otherwise. I could also see that the household virtues, with their concomitant vices, were budding already in the thoughtful heart of his bride.

I would have been content with something quieter this morning than the lilac silk frock, one of the principal bridal dresses and my brother's present, put on to do me honour; but then the motive was so good. Mrs. Roberts was already half aware that frugality was a *virtue*, hence the *bad* fire—and industry a *duty*, hence the blue bell-roping, till the poor girl was herself blue with cold.

"You have been calling on our neighbour, Mrs. Greene," said Roberts.

"Is she so very pretty?" enquired the lady. "The quaker ladies are all imagined so handsome; that odd dress of theirs attracts attention to their faces,—yet I am sure it is not in the least becoming."

"Not in the least, only convenient, and *comfortable* as *clothing*. I wish their female costume were more elegant. But I beg pardon. My friend Joseph's wife is not *very* pretty. She looks the mild, intelligent, amiable young woman which I am certain she is. Her face is very *English*, both in features, and in its serene beauty of expression,—the real, not the *beau-ideal*, English beauty of modern artists."

"The quakers are not musical, I believe?"

"No?—I am sorry they are not.—I do not mean exactly musical, that is now an odious hackneyed phrase; but that those whom nature has attuned to the harmonies of sound, are not allowed to follow her bent. There can be no true wisdom in obliterating the gift of a fine ear, or a delicious voice, because it may sometimes be abused. Rachel Greene has a bookcase where your piano-forte stands. I should like to see both where there is taste and leisure."

"They seem to have very nice furniture though; very *expensive* furniture," rejoined the lady. The subject had become of importance to the young housekeeper, with whom sofas and tables were fairly dividing empire with gowns and bonnets, and threatening to subvert their reign.

"Perhaps the quakers think dear things cheapest. They have excellent, substantial, and even handsome mahogany furniture in sufficient quantity. This *tasty* little drawing-room corresponds to their family chamber. They have no flowery muslin draperies,—gilding or imitation work:—black hair-cloth chairs, and couches; and window curtains, and carpets of some warm colour and substantial fabric—I cannot tell you what all they have."

"And they have no best room," cried Mrs. Roberts, glancing round with triumph on her arrangement.

"They have, and keep it for themselves," cried George laughing. "That is so like broadbrim."

"I presume they may imagine themselves best entitled to the use of their own house. 'Greatest, happiest principal,'—hey George!—Sleep in a dog-hole all the year round, to have a handsome apartment to receive one's pleasant idle friends, once a month or so."

"One can't do without *one* apartment to keep neat for company. Roberts insists on making this our ordinary sitting-room; but as it is fitted up that cannot *prudently* be."

I admired the emphasis, and did not despair of Mrs. Roberts yet comprehending the true import of the word

graced with it. Another trifling incident I noted. Rachel Greene had herself taken from her small sideboard, the glasses and bright *silver* salver required when the refreshment of cake and a glass of wine was offered me. She had but one servant girl, who had come up with her from Yorkshire. Maria Roberts had exactly the same complement of domestic help; but the temporary bell-pull gave way, in sounding the alarm to the kitchen for the supply of our wants, and considerable bustle, misunderstanding, and delay occurred, before the gaudy japan equipage was forthcoming. When I took leave, Roberts told me laughingly, that I must come often to lecture his wife. I had a foreboding that the lectures might be required sooner than he anticipated. The question with me was, did Mrs. Roberts seem a woman likely to profit by elder experience in league with her own; and as I saw no reason to despair of her, but in her energy, activity, and liveliness quite the reverse, I frequently repeated my visits, and always found her busily employed in one useless way or another.

The first grand marriage dinner followed close on the completion of the fittings-up, the covering of the ottomans with blue, and the suspension of the blue bell-ropes. I could not resist it. My brother's wife, with prudent consideration of a very small house, took only one daughter to represent the five who were to appear at tea. Mrs. Roberts had spared neither time, nor thought, nor labour. She had given her orders with spirit; and freely drawn upon the thrice replenished gold and purple purse. The result was, every thing considered, and fair allowance made, a very *genteel entertainment*. True, we were sadly crowded:—many things were forgotten, several lacked of the thousand-and-one articles necessary to English *stylish* dinners; and there occurred numerous casualties. Several compulsory levies were made during dinner on the glass and plate stores of Rachel Greene. But on the whole, though the thing did not work so well, where *hired* cook, *hired* footman, *hired* char-woman, hired every thing were strange and awkward, as where there is a well-drilled establishment, we got through the day, and night, without affording materials to Theodore Hook for a chapter on bourgeois pretension; leaving on the field of action three imitation rosewood chairs dislocated, and two broken, many stains on the bright blue furniture, compelled for the day to do parlour duty, with a large lot of cracked china and glass, and several plated forks reported missing.

"What's the good of Roberts giving such expensive fine dinners?" said my ungrateful brother, (who had praised the venison to the skies, and been helped twice) as we drove home. "His wife is but a child, poor thing, but he should have more sense. I must tell Master George this won't do."

My sister made her ordinary good-natured excuses. "It was the first entertainment—a marriage dinner; people must be like their neighbours."

"Well, well; all very good, Anne; but we shall see." What selfish suspicious wretches prudent men in business are! James was already thinking of another clerk.

On my future calls upon Mrs. Roberts, I found her always at work, busily employed, as if for daily bread, in embroidering caps and habit shirts, or altering and repairing her own dresses. One day in the end of March, as I find by my diary, I visited Mrs. Roberts, after having called upon her neighbour, Rachel Greene. Indeed I never went to see the one lady without calling for the other. Both appeared alike anxious to fulfil their duties; both were economical and *industrious;* but with how different an understanding of the domestic virtues! Maria Roberts was, beyond all doubt, the most laborious of these fair neighbours. By twelve o'clock or earlier, any day that I called, I found Rachel, all the arrangements completed that took her to the kitchen, seated in her parlour with her *plain work*. All her work I found was what women call *plain work;* making or repairing useful garments—often of very ugly shapes—without seeming to consider that one kind of useful *seam* had greater pretensions to gentility or elegance than another. Her work was very often neighboured by a book, for, as she modestly told me, this year, she had more reading leisure than she could in future look to have. At a regular hour she went abroad for her accustomed exercise, and generally brought home my friend Joseph to their early dinner.

"How I envy my neighbour—her walking and reading leisure!" said Maria, with whom I was now so intimate that she pursued her *ungenteel* work in my presence. "She looks always as if she had nothing to do—nothing to trouble her." The placid pair were passing, arm in arm, into their dwelling, accompanied by an elderly friend from the country, who had come on chance to share their family dinner.

"Why don't you make leisure—what are you always doing? Your family is exactly the size of Mrs. Greene's; your labours less in one way, for Rachel is a *martinet* about her house and furniture. She is making her new tables all looking-glasses. You tell me you have given up parties—what are you always doing?"

"Doing! Mr. Taylor; I wish you knew the half of it; but gentlemen never do understand ladies' work. I wish school girls only knew what married life is,—with a small income,—(a sigh.) I have not opened my instrument these six weeks; I have not looked into a book; indeed, I have given up the newspaper, it was so expensive, and such a waste of time, as Roberts sees it at his chambers. It is always *sew, sew, sewing*, as you see; but I don't repine at this. It is necessary that I should be industrious, and I rather like it." And she pinched, plaited, and held off, at arms' length, some part of the lilac silk dress which she was adapting to a new spring fashion, the garment having the misfortune to have been made in the extreme mode of the last October. I could perceive it was a tough job, and one which required both patience and affection for the work.

> The flirtish form to poor materials lent,
> And one poor robe through fifty fashions sent—

How much of female time is consumed in this way,—time, valuable for health, for knowledge, for social enjoyment, for really productive labour is thus destroyed!

"Maria, when we obtain that nicely balanced constitution of king, *Ladies*, and commons, of which we have so often talked, I hope Rachel Greene, representative of the women of this district, will bring in a bill, decreeing that when a dress is once made in the proper form, there it shall remain till worn out, or, at least, till it require to be turned. I will have no re-modelling, no adaptations to new style. How many mornings will this piece of gear cost you now?"

"Mornings! ay and evenings, Mr. Taylor,—four or five at the least, I assure you. If I have it finished before Easter Sunday it is all I expect;" and she again turned it over, and plaited away.

"Fit preparation for that festival! Let us count the cost. Four or five long delightful walks in these bracing, invigorating, spring mornings—exhilarating to health and spirits even in London streets. A great many hours of pleasant, useful, or serious reading;—storing knowledge for future days; ay, and several long evenings, in which you might have indulged your own taste and that of your friends, with some very good music, which you can give them when you like—no lady better."

"It is hard!"—(*a sigh*)—"But you know I work from *principle*—from a sense of duty. I can't afford to pay a dress-maker."

"Fashion anew a lilac silk gown from principle!—*Umph!*"

"From a principle of economy, Mr. Richard!"—(pee-

sickly)—"What can I do? I brought Roberts no fortune—I must be industrious;" and the needle flew, while the colour rose. How could I be displeased? I blamed my own severity, and gave her virtue the praise it merited; for here was the virtue of industry, however unenlightened and misdirected.

"Your good opinion, I am sure, is very flattering to to me. Mr. Roberts has told me so much good of you; and I am so strange here, and inexperienced, that I am most grateful for your advice. I have been so much benefited by your conversation and knowledge already. It was you first gave me the motive to industry, by showing me how expensive every thing is in London."

"I am afraid I have blundered exceedingly, or else my patient has misunderstood my directions. If this sort of work *must* be done, it would, in my opinion, be better economy, better sense, better every thing, to pay for it ten times over, than ruin your health, waste your spirits, and sacrifice the comforts of your domestic arrangements in this way." Her colour rose yet higher, as we both looked round the somewhat littered parlour, in which Mr. Roberts was in a short time expected to dinner.

My remonstrances were not yet of any effect. My young friend was acquiring a young housewife's passion for *work*. She was what the women call neat-handed. She was inventive, ingenious, and loved to be fashionably dressed; and her whole time was accordingly spent in fabricating ornaments for her own person or her house. Hannah More speaks somewhere of six weeks of the precious time of an immortal creature being spent in embroidering a child's cap. She should have said—not by a poor creature who, to sustain the life of her own infant, must labour thus to decorate the child of some more fortunate woman, but by ladies commanding money as well as leisure. If Mrs. Roberts took not above a month to her christening-cap, it was because she was a very deft, and indefatigable needle-woman. Hardly was she earning the praise bestowed upon her by the good-natured of her own sex, of being a remarkably genteel, nicely-dressed young woman, and so excellent an economist!—the ill-natured sneered at the foolish attempt of a person such as she! striving to appear like one of thrice her fortune; and they perhaps were in the right.

CHAPTER V.—DUTY.

I have often been amused by the meaning women attach to particular words, and among others, to the stern word *Duty*,—that principle by which the stars are kept from "going wrong," and households from being converted into dens of dirt and discomfort. One morning, on my way to Roberts's house, I called upon one of my numerous dowager acquaintances, to pay my respects to a niece of a certain age then with her on a visit. I pretend to some skill in female works, for which, with my learned friends, I plead the example of Rousseau. When I had satisfied myself, or at least the lady, about the astonishing progress made by her pupils in the country, to whom my sister Anne had recommended her, I examined and admired her work.

"And such industry, Mr. Richard!" cried the aunt. "In the ten days she has been here, she has done as much as will trim five! and yet we go about all day."

"My dear aunt," cried the younger lady, bridling, yet with a modest blushing disclamature of all superhuman virtue, "I am only doing my DUTY."

The *duty* was twisting tape into a zig-zag form, to make a railing for the bottom of her five new petticoats.

When I walked to Rachel Greene's I met her at the door, going out to visit the infant school she had assisted to organise in this neighbourhood, and which she anxiously and unostentatiously superintended. She invited me to accompany her, and I asked permission to take young Mrs. Roberts. I wished much that these neighbours were better friends. "Certainly," said Rachel cheerfully; "these visits will soon form to her, as they already do to me, a delightful DUTY. I have of late taken a great fancy to watch children. I wish friend Roberts and I were better neighbours. I used to love to hear her through the party-wall singing her hymns and psalms; but I think she has given that up." Here was unexpected liberality, Perhaps Maria's music might be only Italian melodies or opera songs; but I was not going to tell that to Rachel. Maria could not go with us; she regretted it sincerely; "but all this must be done before dinner." She was making up a head-dress for an evening party—to save money—"You would not have me desert my *duty*?"

"Certainly not; but think beforehand, I would have you, of the kind of duties you lay upon yourself." Maria watched our return, and tapped on the window as soon as I had left my fair friend within doors "Oh, that sweet, serene Rachel Greene," she cried, half laughing; "how I do envy her!"

"Had you seen her in the last hour you might."

"Nay, I shall be jealous too. Roberts gets as bad as yourself, we shall have green-eyed monsters among us I can tell you, if we cannot be Greene."

"Why not be as *green* as desirable?"

"Is it the soft vernal grass, or bright apple, or brilliant emerald, green you would have me? Really, Mr. Taylor, you could not wish me to turn quaker?"

"Clearly not, unless your reason and conscience bid you; I don't intend to turn quaker, myself, but I would like to see you turn a *rational*, for which I am sure nature intended you, Maria, and from the friends you may obtain excellent hints. With what you call your limited income, how much comfort and leisure a quaker family could command; but how much more enjoyment you could command with your accomplishments and taste." There was, with me, one decided superiority which Maria held over my friend Rachel. Her different mode of education, and scope of reading and lively fancy, made her understand all my allusions, whether playful or sarcastic. This had at once established a certain correspondence and sympathy between us, even when we quarrelled. But if Rachel did not always perceive the point of my illustrations, Maria was far more backward in apprehending the force of my reasoning, when directed against her own notions and practices. It was in vain that I strove to convince her that the household god she had set up under the name of duty, was an ugly misshapen idol, blubber-lipped and with squinting eyes, consuming the time and wealth of its votaries in the besotted rites of a stupid and blinded idolatry. In vain I talked to her of the slavery to which she was hourly condemning herself. She could not yet renounce her idol worship.

"I wish we were as rich as the Greenes, Mr. Taylor," said she, "and then I should be so happy to visit your infant school, or walk or read, or be social,—but at present"———

"Why, at present you spend more money than Rachel Greene."

"You don't say so! This last year, to be sure, has been a dreadfully extravagant year; the outset always must; and that shocking expensive dinner!"

"I can at once tell you what Rachel Greene's housekeeping cost in the last six months."

"Does she talk to you of her family affairs? I thought that had been indelicate, improper, in money concerns."

"So English people in general seem to think. Money is the only thing of which they must not speak, because they are eternally thinking of it, because it occupies their whole souls, and because, poor creatures! they really feel it a disgrace and crime not to have a very great deal of filthy lucre—or what is thought a great deal for them.

Why else may not people talk with as much candour and frankness about their incomes as they do about their children, or any thing else nearly pertaining to them?"

"Family matters! Mr. Taylor?"

"Ay, family matters is the name. Be assured, Maria, it is either selfishness, insincerity, or coldness, that prevents *family matters* from being the topic most frequently talked over of all matters between true friends. These are interests, which, above all others, 'come home to *women's* business and bosoms.'"

(*A long deep sigh, followed by a pause.*)

"I believe that, Mr. Taylor: but you perceive how the world goes"——

"The world of England?"——

"All one sees, hears, or reads, forbids the sort of frankness, and the notions you hold. No one writes a book on education, on domestic morals, on household economy, or even on cookery, but what is adapted to wealthy persons,—Miss Edgeworth and Rousseau included. Their systems are all concocted for people worth at least 500*l.* a year;—and they require much more."

"I wish we had better elementary or guide-books, Maria. Your remark is acute, and far more just than many that are made by the critics on these works. Hannah More was an honest woman, when she said *Hints for the Education of a young Princess*, limiting her book to one individual. All works on education hitherto published, ought, in common honesty, to be entitled, *Treatises for training the children of the Rich*:—or books of counsel for the wealthy. We have no systems for the *many*—but still we have our "old experience"—

"To what does it *attain* in my case, sir?" My young friend smiled upon me with so much sweet earnestness, that I could not help vowing my best efforts to aid in solving her difficulty.

"With certain *data* to something like absolute certainty, Maria. For example, how much domestic comfort of the extrinsic kind, a family of three or four persons in London may secure for 200*l.* a year. Or take any British or Irish town, and vary our estimates from 15 to 25 per cent. You wont live 25*l.* per cent cheaper in Kerry or Lerwick than in London, believe me Maria—nor in any continental town I ever knew; though you may vary your style of living, you may *retrench*. If London is not a *cheap* place to those who wish to make it so, then is the division of labour mockery,—cheap carriage and the principle of *competition* all *humbug*. But London *is* a *cheap* place, cheaper than Boulogne, or the Norman islands, if you please to exercise your understanding aright—and exorcise, cast out, the Demon *Fashion*, and the Imp *Style*."

"To return to the *data*, Mr. Richard," said my fair friend. She really stuck better to a text than most women.

"The *data*, madam, in the present case, is £197 15*s.* 8½*d.* I found it in Rachael Greene's little book."

"Sordid creatures!" exclaimed Mrs. Roberts, "with an income like theirs to spend so little! For what do they hoard?"

"You are unjust, Maria. You take their highest rate of income. So do all enterprising gentlemen who afterwards grace the bankrupt list. My friend Joseph Greene's income, unlike my friend Mr. Roberts's, is fluctuating. This year his profits may be £500; next year £150, or less. Bad times have come on all retail dealers, and threaten to continue. His father made much more money in the same trade and shop. Now, Joseph and his wife in their honeymoon"——

"A quaker honeymoon!" cried Maria, in scornful mirth. "Fancy a pair of quaker turtles!" (*a scornful, hollow laugh.*)

"Call it what you will, Mrs. Roberts; it was the time of the first sensible, prudent, affectionate, and confidential talk between my friends, Joseph and Rachel Greene, by their own fireside, in the first month of their marriage: then and there they struck the average of the profits of our friend Joseph's trade, and resolved that £200 a year was all that could be reasonably afforded for household expenses."

"Sordid!" again exclaimed Maria.

"Far from it. The only circumstance I ever heard Rachel Greene regret—and she speaks most frankly of her means of life, not considering that there is any difference between £50 a year and £50,000, where each is the sole product of honest industry and diligence—is that she cannot know exactly at the end of each year how much is over—to be laid up, as she said, 'where moth and rust cannot corrupt, nor thieves break through.' She already guesses, I suspect, that our friend Joseph admires a different kind of investment. All her own savings, I know, she devotes to deeds of benevolence. Her heart, like the hearts of most women, is naturally compassionate. She even gives to common beggars, and forgets the far-seeing wisdom of her sect, and of the political economists. One day I checked her. 'Alas!' was her reply, 'that poor old man's pale, emaciated face tells me a true story. Shall not we *women* apply the lenitive, till you *philosophers* cure the distemper; because that poor man may perhaps be so far an impostor, shall I harden my heart against my fellow-creature—my fellow-immortal? Him who, as a Christian, I am bound to hope, shall share the joys of heaven with me—shall I withhold from him my wretched pittance on earth? Is this to do the will of Him who maketh his sun to shine and his rain to descend, alike upon the just and the unjust?"——

"Amiable woman! I was base to doubt her worth," cried my young friend, in whose eyes tears had gathered. "How shall I resemble her? Where learn like her to know and do my duty?"

However unfit I may be to give counsel, I am not the man to hear such an appeal with indifference.

"I have been surprised," I continued, "to find how nearly friend Rachel hit the mark in her expenditure. But she would not spend more—did not wish to spend much less. She has an excellent idea of the prices and values of all ordinary commodities, and of how much of every thing is required in a family of a certain number; and this, with the domestic discipline, frugality, and good management, which the uniform, regular habits of the quakers, and of many quiet English families, give their women as it were by hereditary right."

"Management!" Maria's ear mechanically caught the word. "Can you show me Mrs. Greene's system?"

"I cannot—probably it is not what you would call a system.

A few good instincts, and a few plain rules,

Maria, derived from her Yorkshire granddames. 'Economy,' says Johnson—no economist himself—'is a very nice thing—one man's coat wears out much sooner than another's.' Neatness, regularity—above all, order, and the absence of vanity—must be essential to her system. I believe that young housekeepers often fail from want of knowledge of the principles of arithmetic."

"Of ciphering, Mr. Taylor? Nay, I can challenge the whole quaker and housekeeping world there! I got three prizes at school for ciphering."

"But can you apply your knowledge, fair lady? Can you tell me in a moment how much a young couple, whose annual income is under £300 a year—call it for safety £270—may afford to expend on one dinner? Come, now, by any rule you please? *Experience—practice* is best—I mean without forestalling their income, an increase of their family rendering a certain enlargement of expenditure necessary." Poor Maria fluttered and coloured, tears again gathering to her eyes. I

cannot say whether *management* or maternity now preponderated in her heart.

"I cannot yet tell; but I fear not so much as this." She had unlocked the little desk, and taken out the *book* so thumbed and studied, and so mysterious in the frightful totals which it cast up out *of nothing*. To me the amount was at least not astonishing, as I was quite aware to what an enormous expense her absurdly extravagant first entertainment must have come; the soups, the fish, the game, the jellies, the creams, the dessert, the wines, the hundred-and-one incidental charges, which any woman less clever and anxious to probe to the bottom of the evil would have overlooked and slurred over; but which here stood in a formidable array of figures. *Plunder* ought to have formed a considerable *item* I dare say; but it was not entered under this head. It is always fortunate to make a good smashing loss at once, which may startle one, and put one on one's guard. "£18. 5s. 3d.; well, I don't think that so far out of the way, considering the good *style* in which the thing was done. Some things appear very reasonable—other items extravagant enough. A monstrous quantity of Epping butter; but good cookery requires good oiling; nothing in the world goes sweetly at first without it."

"And we gave a very nice, genteel evening party with the left things—ham, cakes, jellies, and other things."

"And that is a *per contra*."

"Oh! Mr. Taylor, a *per contra* to this abominable bill! No, no!—I am grieved and ashamed to look at it. How useful to me were half that money at present to get decencies and necessary comforts; no wonder Roberts says I cannot manage." This was unlooked for humility. "I dare say Mrs. Greene could have given half a dozen dinners with that money?"

"Probably a whole dozen, Maria, all good of their kind, too; but then the party would have been small, in conformity to the house, the attendants, the income, the number of *real* friends; to economy, good sense, and true social enjoyment."

"I see it all, Mr. Richard; Roberts was right in saying I can manage no more than a baby—no more than a baby! Think of that, sir; you who have seen how I have laboured for eight months out of the twelve I have been here, injuring my health, as you have told me often, and spending almost nothing upon myself: to be sure, I was fully equipped last year. I declare, when I have been chilled to death, tortured with chilblains and threatened with rheumatism, I have denied myself a shovel of coals in my chamber, to economise; while Mrs. Greene has a good fire every cold evening, and her chamber so much more comfortable than mine, as they have no drawing-room; but let the quaker ladies alone for taking care of themselves."

"To how much does *almost nothing* come, Maria?" was my rejoinder. "You must forgive my freedom, since you invite my counsel. Let us see." The little book was again produced. I was aware of one *irresistible* French summer bonnet and scarf, and an indispensable autumn evening shawl; but as it turned out, there were fifty other trifles, bits of lace, and joining lace, morsels of ribbon, scraps of gauze, gloves, shoes, &c. &c. that came, when summed up, to above £8. Maria was in astonishment. Her dexterous ciphering had never suggested any thing like this. "What you say of my friend Rachel's extravagance in fire and *comfort*, is quite like her good sense. She keeps possession of her own house for her own self; lives to her own feelings, her own conscience, even to her own comfortable bodily sensations, rather than to idle people's eyes, or to fashion and vanity; and is she not right?"

"That Mrs. Pantagus almost made me buy that bonnet and scarf, one day that she did me the honour to introduce me to her own *milliner*. I know it was wrong, too, to purchase *French* things. We should encourage the lace-makers and embroideresses of our own country."

I smiled involuntarily. "Now," she continued, "the quaker ladies give no encouragement to the industry of their own sex. They wear no lace, embroidery, or fancy articles. Now, surely it is right for women to encourage the industry of their own sex; and all ladies, you say, have a right to buy whatever they like and can afford."

"Which conscience and understanding approve:—clearly, Maria."

"Now, were we all to turn quakers, the whole factory-women would be thrown idle, with all the lace-workers."

"Not idle; only differently, and, I am sure, better employed, in their own households, as daughters, wives, and mothers, for such rational length of time daily, as neither trenched on health or enjoyment, and the mental culture, without which the condition of the human being, even with lace and embroidery, is but little above that of the beast which perishes. You blame the quaker ladies for not buying lace and embroidery; do you know any thing of the state of the poor women engaged in that manufacture, or in what you term fancy articles, married as well as single women?"

"Not much; only I know they work amazingly cheaply: so cheaply, that if I were as rich as Mrs. Greene, I would always buy, never make. That *thing*, as, like an ungallant gentleman, you term my beautiful *canezou*, has cost me six weeks' labour; and I could buy it in a cheap shop in the city for £1. 2s."

"And certainly not the half of that sum went to the poor creature, who sat bundled up fourteen or sixteen hours a day, poking her eyes out working it, earning from 6d. to 8d. daily. Have you ever had an opportunity of visiting the cottages or town-dwellings of the lace-workers in Buckinghamshire, Nottinghamshire, or Northampton county?—always abodes of discomfort and penury, often of actual starvation—where the natural order of things is very frequently inverted, the husband arranging the house, that the hands of the sickly, slatternly wife, may not be rendered unfit for the delicate employment on which her children's bread depends.

The free maids that weave their lace with bones,

are among the most miserable of the slaves of civilisation; and its chains press upon and gall us every one, the rich as well as the poor. But let me not say civilisation—it is a fashion, vanity, madness, I really mean. Society cannot be too highly civilised. I would see it rise to far higher enjoyments among its Marias, than this everlasting *ornamenting*, and needle and scissor work."

My young friend took up a book, with an arch glance at me. "This is a favourite writer with you, sir. What says he—'I love ornament! all nature is full of it.'"

"And so do I, love the ornament with which all nature is full: its colours, odours, forms; all its exquisite beauty, intricate or palpable, universal or minute—cannot be enough admired and glorified. Flowers, 'the stars of earth;' stars, 'the poetry of heaven;' these are ornaments I love—and for this, among a million reasons, that their beauty is immutable, unchanging. The rose has been the '*red, red rose*,' with the same rich foliage, since it first blossomed in Eden. The pale lily has risen on the self-same graceful stem, since the general mother, 'fairest of her daughters,' first bent her dewy eyes upon that flower of Paradise. So, when you quote Leigh Hunt against me, Maria, in favour of changeful fashions, as well as profuse ornament, you must quote in the spirit. If the rose chose to prank herself every season in new garniture, and sported yellow flowers with blue leaves, and brown with white the next, I should tire even of her: if the lily forsook her slender stem and pearly white tint—her Naiad beauty—to flaunt in crimson, with glossy

leaves, I would be for instantly deposing her as the queen of flowers:—yea if Jupiter himself—

'The star of Jove, so beautiful and large,'

chose to astonish the nations by rising to-night, angular in shape, with a deep, sapphire radiance, and to-morrow in flame-coloured taffata, I would vote him a huge bore—and any thing but an *ornament* to the heavens. The analogy between the ornament of which all nature is full, and the perpetually changing, gaudy, inappropriate artificial ornaments of vanity and fashion, does not in the least hold, or rather it makes for me."

"Then you would not discard all beautiful, all magnificent things,—nor even our pretty decorations?"

"Certainly I would not,—only ugly trumpery, useless trash, to which you make yourselves slaves."

"Lace, for example, that exquisite fabric which Rousseau admired so much?"

"The *Man of Nature* was, in many things, a very sophisticated, artificial personage, Maria,—almost a coxcomb. I have no objection to your lace, and delicate needlework; though, in my arcadia—my ideal republic—the beauty, health, and spirits of one order of the women shall never be sacrificed, that another may wear a thing about her face which Rachel Greene looks very pretty without, and Maria Roberts also."

"A compliment by implication! I shall value it were it but for the rarity," said my laughing companion. "Well, though our caps and veils cost something, pink bows, and *brides* included, the quaker ladies don't dress,—*clothe* themselves,—I beg pardon—for nothing. In the quality and fineness of the material, they are perfect *exquisites*."

"A consequence of really enlightened economy. Mrs. Greene seriously asked me one day if I could, in this part of London, recommend her to a *dear* shop. Persons with whom a fashion lasts till a garment wears out, show good sense in making it of such materials as are worth bestowing labour upon. But let us reckon now, Maria, the real difference of money-cost between your lace English cap, and Rachel's snug quaker one; or, say, between it and the tasteful veil of thin muslin, the becoming head-dress of a Genoese girl."

"I presume the Genoese head-gear like the quakers—(like, and yet how unlike!)—may cost 2s. or 3s.; mine, my own labour, *brides* and bows included, at least 25s; so there is a clear 21s. or more, for Rachel Greene to hoard, which I distribute in encouraging manufactures, you perceive, sir."

"To spend on her *infant school*, as like, Maria; or very probably in fuel or flannel petticoats for the poor creatures who have become sickly, and prematurely old, spending their life in fabricating ornaments for more fortunate women."

Maria sighed at this view of the question. "I do envy the rich, and the *Friends*, their means of benevolence."

"Don't be content with envying—*attain*; go to the fountain-head. The means of enlightened benevolence are in every one's power. Begin with my amiable young friend, Maria Roberts; emancipate her, in the first place, from her profitless, thankless toils, and this will be one great good gained."

"If the *world* would only come to your way of thinking, Mr. Taylor:—the first edict, I assure you of your king, *ladies*, and commons, which commands more rational conduct"——

"Unfortunately edicts won't do it." There was consequently no more to be said. What Maria called the *world* was still too strong for her. She was more and more its reluctant and repining slave; but not the less fettered that her very restiveness made the chain gall and fester in her flesh.

Before I saw Mrs. Roberts again, she had suffered from a severe rheumatic fever, produced by the cold sifting airs of her attic chamber; and by imagining that it was absolutely necessary to have furs to wear abroad, while flannel and fleecy hosiery might be dispensed with, not being *visible*, which, by the by, seems the practical belief of two-thirds of the female world, where both cannot be obtained.

Towards the end of the year tradesmen's bills, of all sorts and sizes, came tumbling in. Every new bill was a fresh surprise; yet their items were like housemaids' newspaper characters, *undeniable*. Maria studied, and summed, and filed, but could not cipher away the startling amount; and now mistaking the reverse of wrong for right, as far astray as ever, and more offensively, the small coals were meted out by scuttlefuls, the salt by cupfuls, she counted the candle ends, and reckoned the potatoes. The small joint was charred for want of fire and Epping moisture, the pie-crust smelt of rancid kitchen stuff. Roberts, in an angry fit, vowed that he would dine at an ordinary, and the maid mutinied. Another was procured—*cheap*,—an awkward country lass, who, hitherto accustomed to handle only wooden pails and buckets, broke all more brittle wares. Roberts was for the time appeased. Indeed, if he had not, he must have been a savage,—for poor Maria, almost killed with mental anxiety and efforts at management, gave birth to her first child; and, to save expense, dismissed her nurse so soon, and was taken so seriously ill in consequence, that my sister instantly procured a country nurse for her infant, and another for herself, scolding the unhappy Roberts for his senselessness; and making such inroads on Maria's savings and plans of retrenchment and economy, as I fully believe retarded her recovery.

By the middle of February Maria was restored to health—pale and meagre enough, but quite well as she vowed; and she brought home her child, from affection and economy, to be what old Irish and Scotish nurses call brought up "by the pan and the spoon,"—and English ones, "by the hand."

The christening feast and annual holiday-dinner were to be consolidated this year in furtherance of economy and retrenchment. Maria had given up her needle. She was now an active housewife. Long were the consultations we held. "I will show you a different bill from last year's," said she to me with harmless exultation in her newly acquired knowledge,—"You shall see how I will *manage!*"

I had no wish to damp her ardour, nor yet to check the current of her self-teaching. *Painful* experience I saw it was to turn out, but not the less wholesome in its effects. Her first dinner had been the *senselessly-ostentatious;*—her second was to be the most disgusting of all, the worst of mistakes, the *shabby-genteel*. I reserve its mortifying details and consequences for another chapter.

ROYAL SOCIETY.

The annual meeting of the Royal Society was held on Monday at the apartment of the society in Somerset House. In the absence of the Duke of Sussex, J. B. Lulback, Esq. took the chair; and after some preliminary business had been disposed of, the medals were distributed; the first to Mr. Lulback, for his papers and observations on tides; the second to Mr. G. Lyell, for his geological researches; and the third to Signor Pianna, for his astronomical observations. A letter was afterwards read from the Duke of Sussex, stating that he was aware of having been for some time an inefficient president, and that, should his indisposition unfortunately continue, rather than compromise the interests of the society, he should, previously to the next election of officers, deem it to be his duty, painful as such an event would be to his feelings, to tender his resignation of the office of president. The ballot for officers then took place.

London Athenæum.

From the Foreign Quarterly Review.

LIFE AND LABOURS OF CUVIER.

1. *Eloge de M. le Baron Cuvier.* Par. C. L. Laurillard. Conservateur du Cabinet d'Anatomie au Museum d'Histoire Naturelle de Paris. 1832. 8vo.
5. *Notice Historique sur les Ouvrages de M. le Baron Cuvier.* Par G. L. Duvernoy, D. M. P. &c. &c. 1834. 8vo.
3. *Eloge du Baron Cuvier.* Par M. E. Pariset, Secrétaire Perpétuel de l'Académie Royale de Médecine. 1834. 8vo.
4. *Mémoires sur le Baron Georges Cuvier, publiés en Anglais* par Mistress Lee, *et en Français* par M. Théodore Lacordaire. 1833. 8vo.

No private death within our recollection occasioned a more deep, general, and permanent concern than that of the eminent person, to record the particulars of whose life the above works have been written. For a time after it occurred, a feeling was left in men's minds as if the very course of natural science must be arrested by it; and vain as such a feeling must be—for the course of science can never wholly depend upon any individual, however wonderfully endowed—it not unnaturally arose out of the impression which so capacious an intellect as that of Cuvier made on the age in which its manifestation was permitted.

A long cessation of the rude excitements incidental to a state of war has left men more open to such impressions, and to the true glories of science an undisputed claim. Our enthusiasm now waits on the merits of the improvers of knowledge, and the fact speaks well for the age of which it embodies the character. To follow with eagerness the unavoidable devastations and outrages of conquest, to peruse with savage wonder the daily reports of all that legal carnage and unrestrained physical force can effect upon mankind, is no longer the accustomed occupation of a large part of the thinking world. After a quarter of a century of military glory, nations have leisure to ask to what end their triumphs have led, and what increase of happiness, what social blessings, have been purchased by so much bloodshed. The conquests which now excite our interest are those achieved in the fields of science, where victory scatters flowers and fruits—is not followed by exactions and sorrows that wring comfort from human hearts, but by happiness and pure delights. The force of which we now contemplate the prodigious effects, is that of the instructed mind of man. We applaud, whilst he lives, the philosopher who reads the heavens and the earth; and we grieve for him when death removes him from the world he improved. We weave the brightest wreath and costliest crown for those who benefit their fellow creatures, and the fresh leaves adorn their memory unspotted by cruelty and crime.

Certainly, of all those of whom enlightened nations have had to mourn the loss in this age, none was more deserving of their attachment, none did more for them, none performed his duty upon earth more efficiently and with more marked effects, none more advanced the thoughts of the philosophers of his time, or left the influence of his labours more visible on the labours commencing when his own were ending, than Cuvier. He not only lives in his works; his spirit is yet with us: even in death he is in the front of those who are advancing, and his very remains lead them on to the rich rewards of new discovery.

The journals of science and of literature throughout all Europe have shown the anxiety of different classes of writers to do justice to his greatness. His various acquirements, equally vast and minute, his multiplied labours, his elevated views, his private virtues, have furnished to each admirer so many topics of just eulogy. The naturalist, the moralist, the orator, the statesman, have each acknowledged the sympathy which binds them all to a man in whom every variety of merit seemed to be united, and whose eloquence equally adorned and enforced the philosophy of science and of life. His attached friends, and the pupils who reverenced and loved him, have felt that the contemplation of such a character charmed and elevated their own, and have lingered over reminiscences, before which all that was mean, or indolent, or unintellectual, fled away. The publications before us are but a few of the offerings laid upon his tomb, but they are sincere and precious. M. Laurillard, the conservator of the Cabinet of Anatomy in the Museum of Natural History of Paris, was a co-operator with Cuvier in several of his most important investigations, drew many of the figures which illustrate his works, and is entrusted with the publication of some of his manuscripts. M. Duvernoy is the professor of natural history at Strasburg, and deems no means so powerful to excite a noble enthusiasm in his pupils as that of setting before them Cuvier's example. M. Pariset is a distinguished physician of Paris, who has often been honoured with important public commissions, and whose attainments and eloquence render him a proper organ for the expression of admiration and gratitude on the part of a profession to which the labours of the naturalist had presented many valuable facts and opened great generalisations. Mrs. Lee's book, already well known in our own language, is the record of an accomplished friend, who, exhibiting in her appreciation of the writings and public services of Cuvier, a delicacy, a discrimination, an extent of information, and a modesty, most honourable to her sex, has also painted him as he was in private life, and in the bosom of his family, amidst the tranquil occupations of his study, or when sustaining as became him the domestic griefs which in his later years overshadowed him; and she has done this with a fidelity and a pathos to which we think the sympathy and tears of many readers must have borne an unsuspicious testimony.

From these publications might be collected ample biographical materials, which would be read with much interest; but these for the most part have already been laid before the English reader. Their perusal has, however, reminded us of Cuvier's claims to be commemorated, not only by those who love science, but by all to whom intellectual excellence, or even the pleasures of an elevated literature afford any gratification. When death has put a period to the

efforts of exalted individuals, exposed even by that exaltation to some misrepresentation, we may reflect, not without profit, on their earliest efforts, on their maturer performances, and on the hopes and thoughts which animated them until death extinguished all that mortal efforts can reach, or left the least perishable results to be transferred to successive minds for slow and complete development. We shall only mention such particulars of Cuvier's life as cannot be separated from a view of his intellectual progress. He was a native of Montbéliard, then the chief town of a principality belonging to the Dukes of Würtemberg. His parents were not in easy circumstances, his father being a half-pay officer, who, after forty years' service, was unable to afford to his son more than the common advantages of provincial school education. At fifty years of age he had married a young and accomplished woman, who became the mother of George Cuvier, and by whom his early years were guarded with affectionate and judicious care. Her more than parental solicitude for his mental improvement justifies us in adding the instance of Cuvier to the many examples of distinguished men who, perhaps, owed a considerable share of their greatness to the attainments and character of a mother of superior understanding. History presents us with numerous instances of this nature, and they seem the more curious when contrasted with an equally well established fact, that the children of very eminent men have seldom been distinguished for ability, and have frequently proved either feeble in mind, or of precocious talents and a fragile and unenduring frame. In many families rendered illustrious by one great name, the father and grandfather of the distinguished member of the family were men of good understanding, without being brilliant; but after the great man, the line has immediately and sensibly declined. The physiological hypothesis may be, that the offspring of men devoted to the pursuit of fame in arduous paths, are necessarily of imperfect organisation; or that there is some law which, permitting an ascending scale of intellect to render families eminent in a generation, checks their vain aspirations after perpetuity of influence, by withdrawing the gift when it has reached a certain elevation, leaving the proud edifice of their fame, which once they flattered themselves would reach the heavens, a mere unfinished monument. However this may be, Cuvier's mother was worthy to bear such a son. She watched over his infirm infancy with the tenderest care, and she saw and directed the developement of his wonderful faculties. "The joys of parents," says Bacon "are secret;" and great, although it may have been unexpressed and inexpressible, must have been the joy of such a mother watching such a son. He was singularly diligent and thoughtful, and when no more than ten years old was not only a delighted reader of Buffon, but faithfully copied all the plates, and coloured them according to the descriptions which he read. Accustomed as we are to speak of Cuvier as the great interpreter of the animated parts of nature, it is a pleasure to read that his affection for this admirable parent was cherished by him to the latest period of his life, and that nothing gave the great philosopher and harassed minister more delight than when some friendly hand had placed in his apartment the flowers which his mother had taught him in his youthful days to love.

An injustice done to his boyish merits caused him to abandon Tübingen, the first place selected for his education, and the church, to which he was then destined. With happier auspices he was sent to the Académie Caroline, under the more especial patronage of Charles, Prince of Würtemberg. This prince, after wasting some years in a vain imitation of the extravagances of Louis XIV., devoted much of his time and attention to the promotion of education, and founded the above-mentioned academy at Stuttgard, which, although commonly called the military school, and placed under a kind of military regulation, was in reality a school of public functionaries and statesmen. The young Cuvier's various talents, or rather his vast capacity, which had already become perceptible, were diligently exercised in a wide range of studies, including every subject connected with social and political economy; and to these it was doubtless owing that, in after life, when he entered upon so many and such diversified public duties, he was found to be well acquainted with all that he undertook. The pupils of the academy, instructed in every branch of knowledge that was especially useful to men destined to govern or direct the affairs of communities, became in many instances the ministers of the various courts of Germany, and even of that of Russia. Cuvier had acquired an equal knowledge of state affairs; but at Stuttgard, as before and ever after, his chief attention was given to natural history. He read the best authors, collected specimens, drew and coloured insects, birds and plants, in his hours of recreation.

Yet he was again to be the sport of accident. Injustice had alienated him from Tübingen, and the limited circumstances of his family made it necessary for him to remove from Stuttgard before he could be appointed to any public situation. In these circumstances he took what appeared to his companions the desperate resolution of becoming a tutor in a private family (that of the Count d'Héricy) in Normandy.

But as injustice could not prevent the development of his talents, so neither could any combination of unfavourable circumstances condemn them to indolence or obscurity. As a poor tutor in a retired part of Normandy, at the age of twenty-one, he laid the foundations of that fame which was to fill the ear of the world. The residence of the family, of which he had the charge of the only son, was not distant from the sea, and the study of marine animals became a part of his occupation. Even then he was enabled to make the fossil remains found in the neighbourhood, no longer mere objects of wonder, eloquently instructive, revealing something of the ancient history of the mysterious earth. He compared the living species of sea-animals with those found in digging the earth; and the dissection of a species of cuttle-fish led him to study the anatomy of molluscous animals. Whilst making diligent re-

cords of knowledge for his own use, he was actually rectifying the mistakes or oversights of naturalists of the highest name, and reducing the classification of the lower forms of animals, heretofore in confusion, to lucid order.

We can only pretend to trace the leading events which favoured the development of M. Cuvier's talents, and would refrain, with whatever difficulty, from encroaching on the task of his biographer, to whose pages we must refer the reader for innumerable particulars highly deserving of perusal and reflection. Among the relaxations of his situation, M. Cuvier, thus devoting some years to tranquil study, whilst all France was agitated with intestine commotions, gave some of his attention to a society established at that period at Fécamp, not for political discussions, but for the encouragement of agriculture.

About the same time, at the end of 1794, the venerable author of the articles on agriculture in the *Encyclopédie Méthodique*, desirous to escape the tyranny which persecuted him, took upon himself the duties of physician-in-chief of the hospital at Fécamp, according to M. Pariset; but by Mrs. Lee's account, those of a regimental surgeon, to avoid the discovery of his obnoxious title of abbé. Hearing that a society was formed in the place for the promotion of his favourite science, he attended one of its meetings, and took a part in the discussions. Cuvier recognised the opinions and expressions which he had read in the *Encyclopédie*, and at the termination of the sitting, advancing to the new speaker, took his hand and saluted him as M. l'Abbé Tessier. The alarm of M. Tessier was considerable, but uncalled for, for in Cuvier he had found a generous admirer and a friend. Becoming acquainted with the various acquirements of his new acquaintance, and with his performances, M. Tessier wrote concerning him to the celebrated Jussieu in the warmest terms of admiration. "At the sight of this young man," he said, "I experienced the delight of the philosopher who was thrown on an unknown shore, and saw traced there the figures of geometry. M. Cuvier is as a violet which was concealed among common herbs. He knows much; he draws figures for your work. I have begged him to give botanical lectures this summer; he has agreed to do so, and I congratulate the students of your hospital that he consents, for he demonstrates with much method and clearness. I doubt your finding a more able person for comparative anatomy. It is a pearl worthy of being gathered by you. I contributed to draw M. Delambre from his retreat; help me to draw M. Cuvier from his; he is made for science and the world."

These were warm and kind expressions, very honourable to M. Tessier's feelings, not less to his discrimination, and amply justified by the event. The immediate results were the transmission of some of M. Cuvier's papers to Paris, and his adoption, as a corresponding member, into the Society of Natural History of that city. Thus, observes M. Pariset, before visiting the capital, Cuvier belonged to it by the ties of knowledge and of friendship.

In a few months afterwards, being then twenty-six years of age, Cuvier removed to Paris, and soon became the colleague of M. Mertrud in the newly created chair of comparative anatomy at the Jardin des Plantes, which locality was from that time his home, and the spot in which he advanced to immortal celebrity. It was in the few months' interval which passed between his arrival at Paris and the obtaining of this appointment that he read several papers to the Philomathic and Natural History Societies on the anatomy of the mollusca, of insects, and of zoophytes; papers which caused him at once to be ranked with the most distinguished naturalists, and led to his obtaining the appointments to which he subsequently did so much honour. These papers were but the commencement of a long and brilliant career, created solely by his genius and industry.

"When his first writings made their appearance," says M. Laurillard, "probably no naturalist conceived that zoology could still give lustre to any name. It seemed, in fact, as if Linnæus, by his precise and easy method, and Buffon, by his animated descriptions, his bold views, and the conjunction, before unknown, of science with eloquence, had exhausted the subject; but to the man of genius nature is an exhaustless source of study and meditation. By applying the principles of the natural method to the classification of animals, M. Cuvier ran a zoological career not less brilliant and extensive than that of those two great men.

"Up to his day comparative anatomy, although it had occupied the attention of Camper, of Blumenbach, Hunter, Daubenton, and Vicq d'Azyr, had been little more than an object of curiosity, or of dissertations of more or less ingenuity. M. Cuvier contrived to make it a science which became in his hands the basis of natural history, and the abundant source of physiological truths.

"The labours of Saussure, of Deluc, of Pallas, and of Werner, seemed to have carried geology to as great perfection as it could attain: M. Cuvier, by the discovery of a species of monuments which living nature had left in the interior of the globe, created a new order of ideas in this science, of which the fertile results have changed the character of its philosophy."—*Eloge*, p. 6.

M. Cuvier's contributions to natural history in this early period of his Parisian life, remarkable as they were as proofs of industry, were so much more so as indications of profound sagacity, that the most accredited systems tottered in their base. Even that of Linnæus was found to be incorrect in its first classes, and utterly erroneous in that of insects and worms, when tried by the test of the natural method, already applied by Jussieu to the science of botany.

On looking back at the career of men who have risen by successive performances to the highest distinction, the obstacles against which those performances were achieved are so faintly seen amidst the splendour which they produced, that part of the lesson is lost to subsequent aspirers, who, feeling the pressure of difficulties of all kinds, and seeing the temple of fame shining afar off, on a steep all but inaccessible, forget, or do not know, that those whose names adorn that temple once felt all that now harasses their minds, or clouds the prospect before them. Many professed lovers of natural history resign themselves to inactivity, because they live in the country, and have no coadjutors, or no collections, or few, to resort to. Such per-

sons should remember how much Cuvier accomplished in Normandy; that he became acquainted with all the fishes of that coast, and all the shells, in years of early obscurity, and without pecuniary resources; that a collection having been fortunately made by a resident of Fécamp, every specimen it contained was carefully drawn by him; and that these were in reality the foundations of all that has since given imperishable lustre to his name. Great as was the reputation which Cuvier lived to enjoy, no characteristic of him is more striking than his early and high distinction; for it is evident that before he left the retirement of Normandy, he had already taken a very extensive view of the animal creation; and had read, with the eye of one destined to be the master of that science, the works of all the greatest naturalists. His letters, written from that retreat, exhibit the first outlines of great designs: and before he became personally known to the philosophers of Paris, he had arrived at those profound views which first guided his classification of the lowest classes of animals, to the exclusion of the most prevalent systems of the day. Thus when he appeared in Paris, it was but to be every where heard with delight and conviction, and honoured with applause and appointments. In the midst of these triumphs, however, his frame was frail and sickly, the exertion of lecturing wearied him, and every thing led to the apprehension that his brilliant course would be prematurely concluded. At the same time, the state of his circumstances was far from satisfactory. He had no private fortune, and the government of France was so unsettled, that the stipend attached to his appointments, and on which he and his aged father depended for support, was not regularly paid. "Do not imagine," he says, in one of his letters to his friend Hermann of Strasburg, who had congratulated him on the advantages he enjoyed in Paris, "that Paris is so much favoured. Twelve months' arrears are due to the Jardin des Plantes and to all the national establishments of instruction of Paris, as well as of Strasburg; and if we envy the elephants, it is not because they are better paid than us, but because, if they live, like us, upon credit, they at least know nothing about it, and escape the chagrin it occasions us. You know they say of the French that they sing when they have no money. We *savans*, who are not musicians, apply ourselves to science instead of singing, and it comes to the same thing. Believe me, my dear friend, this French philosophy is worth as much as that of Wolff, or even that of Kant; and you are even better able to profit by it than we are, as you can still buy fine books, and even artificial anatomical models, which are in this way articles of luxury." The allusion in the latter part of this extract is to the acquisition by the University of Strasburg of the work of Poli, entitled *Testacea utriusque Siciliæ*, accompanied by illustrative models in wax, of which he adds there was at that time only one copy in all Paris. It is doubly useful to quote these instances of the difficulties which beset even the brilliant path on which Cuvier entered from the moment he reached Paris; for his manner of noticing some of them, and perhaps the worst, shows that if he were not insensible to their pressure, he knew where to find their most certain alleviation.

Natural history may be said to be altogether a science of modern creation. The great name of Aristotle stands almost by itself among the Greeks in this department, and even the spectacle of the rare animals of Asia and Africa, which graced the gorgeous conquests of Rome, failed in exciting the Roman philosophers to the study of their forms and nature. Pliny alone made, with little success, the ambitious attempt to classify animals, as well as the other productions of nature. A long interval in the history of man is to be passed over before, arriving at the age of Redi, of Swammerdam, of Lister, of Willoughby, and of Ray, we see natural history taking the form of a system. Linnæus, when yet a young man, conceived the bold design of arranging anew all natural productions. His genius was equally profound and exact: he advanced to his great task with the devout feelings which should always accompany and elevate those who presume to interpret the works of nature, and he pursued his exalted studies, unshaken by the numerous and even malignant invectives which were directed against him. Availing himself largely of the labours of the celebrated men whose names we have just mentioned, in his hands natural history assumed more of the form of a regular science. His enthusiastic pupils carried the fame, and something of the spirit of their master, throughout Europe, and numerous institutions arose for the promotion of the science, of which he had made them the zealous cultivators.

Buffon, his brilliant cotemporary, lent to science the rare attractions of a lively fancy, which sought to clothe its images in expressions so eloquent and so felicitous, that not even the superior exactness of his successors or rivals was proof against their power to move and to enchant. Without the minute correctness of Linnæus, his mind embraced wider, perhaps sublimer generalities; whilst the defects associated with this cast of his mind were supplied by the laborious accuracy of his coadjutor, Daubenton.

Not pretending to enumerate every intervening labourer in the same track, which many celebrated names now began to illumine, it may be strictly said, that the general arrangement of natural objects by these two great men was the one commonly followed when Cuvier first appeared in Paris, and that the silent labours which preceded that appearance had already prepared the way for an improved classification, so philosophical and just as to be at once and universally adopted.

It had happened (we believe we may use that expression) that the attention of Cuvier, when in Normandy, had been directed precisely to those parts of zoology which the enquiries of preceding zoologists had left the most imperfectly investigated—the mollusca, vermes, and zoophytes. All these were included in one class by Linnæus, the class of *vermes*, consisting of five orders, the intestina, mollusca, testacea, zoophyta, and infusoria. This arrangement, dependent chiefly on that which had been the basis of Ray's classification, the differences in the respiratory and circulating systems, was materially modified by Cuvier, who

based his distinctions of animals principally on their properties of sensation and motion, the most marked attributes of animals. He was the first to show the intimate and general relations subsisting between the respiratory function, the motive powers, the forms of the skeleton and muscles, and the sensations and digestion; relations comprehending the totality or *entirety* of their properties, and leading to a true natural method of arrangement. Seeing that systems founded on any single organ, or on the most conspicuous varieties of external form, were insufficient to the arrangement of animals, according to their degrees of affinity, he applied to zoology principles analogous to those of the natural method, then recently introduced into botany, and which consisted in the distribution of the facts of a science into propositions so graduated and subordinate in their generalities, that their totality was the expression of the real relations of the objects. Thus proceeding, he established, as it were, the subordination of the respiratory and circulating systems, with all the properties implied by their amplification in different orders of animals, to the nervous system, in which the primary character of each living creature is written. These views had caused him, at the period of life of which we are now speaking, and in the very beginning of his career, to remove the mollusca from the class of vermes, where Linnæus had placed them, to the head of the animals destitute of vertebræ, to which place their superior organisation entitled them. Observation subsequently taught him, that certain species of the mollusca which had been indiscriminately denominated white-blooded, had red blood, and a circulating system; he collected them into a distinct class, the *annelides;* still correctly included, in conformity to his general view, among the invertebrated animals, although previously both incorrectly classified and designated. The best proof of the correctness of the principle of M. Cuvier's classification is, that in the progress of his observations it became confirmed by a wider application, and the principle of the masterly arrangement of his great work on the Animal Kingdom. The *Tableau Elémentaire* announced the principles kept in view in the *Règne Animal*, and their further elucidation in his projected work entitled *Grande Anatomie Comparée*, (for which all the previous labours of his life were but a preparation,) was only prevented by his death. He caught an early glimpse of a great truth which illumined all his enquiries, and throughout all his researches he ever kept it in sight.

His discovery of the red blood of the leech, and the other animals which he grouped in the class *annelides*, was made in 1796; and in the following year he read his celebrated memoir on the nutrition of insects, in which he showed the manner in which respiration was carried on by tracheæ, and absorption by imbibition, a necessary consequence of their want of circulation, which memoir led to the subsequent separation of these from the other articulated animals.

Whilst he was advancing, by these contributions to knowledge, to the fame of a great naturalist, it may be observed, that he evinced no wish to throw into ungrateful obscurity the great reputations which his own was eventually to transcend. In proceeding to treat of any of the great subjects which occupied him, his first care seems ever to have been to set before the reader the merits of his predecessors: he shows what they performed, and how far all who succeeded were indebted to them. Throughout each of his works his frequent acknowledgments of the aid derived from the observations of others show the candour of a great mind, zealous for truth, and truth alone.

The epoch of his removal to Paris was precisely that in which the arts and sciences, and social order, were beginning to be reestablished after the convulsions of the revolution; and although the military prowess of France for many years afterwards continued to occupy the thoughts of the population of that country, yet institutions arose favourable to science, and the cradle of great philosophers. The National Institute, one of the noblest societies of Europe, in which three of the previously existing academies were merged, was founded in 1796; M. Cuvier was one of the original members, and for more than thirty years held, among the great men who assembled in it, no undistinguished rank. His appointment in the Jardin des Plantes had now fixed him in the midst of those objects to which his life would have been devoted by inclination; and from the day of his appointment to the day of his death, his labours were devoted to forming and completing the collections of which it can now boast, and which, when considered with regard to their arrangement, as well as extent, may be pronounced unrivalled. Of the innumerable travellers who have walked through the museums of the Jardin des Plantes, during the last twenty years, the number of those prepared by previous studies to appreciate the treasures there thrown open to them, has not been, perhaps, very great in proportion to the mass; but those who have, with something like a systematic observation, traced the objects contained in those fifteen rooms, and have examined the specimens in the anatomical department, according to their arrangement, and with reference to physiology, are alone enabled to form some estimate of the life and labours of Cuvier. The view of these specimens, opened to the gaze of travellers after the peace of 1814, broke up the slumber of many old institutions: caused the venerable dust to disappear from among neglected specimens in almost forgotten cases in other countries; and gave origin to many new societies, now contributing to spread a love of natural history through all ranks of the people. Nor should it be forgotten, by those who despair of emulating such a collection, that the museum of comparative anatomy, when Cuvier first undertook its superintendence, consisted of but a few skeletons, tied up like so many faggots, and put away in obscure places; on which foundation he soon so far advanced the collection, that its further enlargement was carried on without opposition.

Many circumstances favoured the rapid increase of the specimens. Wherever enterprise or the love of glory led the warriors of France, it was

their pride to collect whatever might enrich the growing collections of their beloved Paris; and, under the directions of Cuvier, the numerous contributions thus received were arranged according to the system which his eloquent lectures explained. By labours which knew little intermission, and with the help of these daily increasing stores, he was enabled, observes M. Laurillard, to lay the foundation of comparative anatomy; to make the discovery of ancient zoology, and to introduce a reform throughout the whole series of the animal kingdom: a reform commenced in the outline of his lectures at the central school of the Pantheon, and finally completed in his great work entitled *Règne Animal.*

"In these works, setting out from these principles, (now, thanks to his perseverance and to the influence which his ideas have acquired, generally known,) that the natural history of a being is a knowledge of all its relations, of all the properties of that being, and that the whole of its organisation should serve to assign it a place in a methodical arrangement; he concluded that anatomy and physiology should form the basis of zoology, and that the most general and constant fact in the organisation should determine its grand divisions, and the least general and most variable facts the secondary divisions. He thus established a subordination of characters which ought to be, and alone can be, the principle of a natural method; that is to say, of such a method of arrangement of beings that the place occupied by each of them gives a general idea of its organisation and of the relations which connect it with all the others; a method which he regarded as science itself reduced to its most simple expression.

"Thus examining the modifications of the organs of circulation, respiration, and the sensations throughout the animal kingdom, instead of the six classes of Linnæus, namely, quadrupeds, birds, reptiles, fishes, insects, and worms, M. Cuvier established four great types,—vertebrated animals, molluscous animals, articulated animals, and radiated animals, which he calls *embranchemens*, and divides into classes of nearly equal value with those long established among the vertebrated animals.

"This was very much to raise the importance of the inferior classes; but already, since the time of Linnæus, it had become understood that neither size nor utility should enter into the computation in scientific distributions; and the justness of the reasons by which M. Cuvier supported his views caused them to be generally adopted. Hardly a murmur was heard in favour of the old classifications. We have, indeed, so little knowledge of the views of the Author of Nature, that the animals which appear to us to be of small importance with relation to ourselves, are perhaps as necessary to the general plan of the Creator as those which we place at the top of the scale of beings."—*Laurillard*, p. 12.

Cuvier had not been more than four years at the Jardin des Plantes before he commenced his *Lectures on Comparative Anatomy*, a work which had become indispensable to his numerous pupils; and in the course of five more years that invaluable work was brought to a conclusion. These lectures were delivered from notes, and with a persuasive eloquence quite unrivalled. His skill in delineating forms was so great, and the representations thus rapidly produced from memory was so exact, that it seemed to his pupils as if, instead of drawing, he had called the objects into an actual existence. It was with the assistance of M. Duméril and M. Duvernoy that these admirable lessons assumed the more durable form of a published work; and it was whilst preparing these lectures, in which, instead of considering the anatomy of each animal separately, every organ of the whole series of animals is examined in succession, that he devoted himself also to the formation of that museum of comparative anatomy which remains amongst the noblest monuments to his memory. The method of following each organ through all the series of animals, in order to deduce a general theory of their functions, evidently prepared him, and more especially in the contemplation of the vertebrated animals, for the discovery of an order of facts illustrative of the theory of the earth, upon which he threw, as is well known, at a subsequent period, so brilliant a light. By this route he attained to that impressive conclusion, not reached by previous naturalists whose attention had been directed to fossil bones, that these remains of animals belonged to extinct races, differing from those which now exist; and his researches further led to establish the fact, before unsuspected, that the differences between fossil and existing animals increase with the age of the strata in which they are discovered; and that these differences constitute a kind of chronological table of the different earths. Every geological student knows with what interest that study has been invested by these discoveries, to which indeed it owes much of its present popularity.

The fossils found in the most ancient layers had previously attracted attention, and served to feed the fancies of speculative observers with vague theories of their origin; but the fossils of later origin, which were the most likely to dissipate some of the obscurity attending the more ancient deposits, had attracted inadequate notice. It was only by the combination of mineralogical observation and the sciences relating to organic structures that the successive eras of the earth were made more clearly apparent. Surveyed with these helps, the most superficial strata became the most instructive; and they have been subsequently rendered familiar to us, not only by the labours of Cuvier and Brongniart, but especially by the accurate and interesting descriptions of Professor Buckland, who has done more than any other geologist in this country to render this branch of study generally interesting. The diluvial deposits of mud and clayey sand, mixed with round flints, transported from other countries, and filled with fossil remains of large land animals, for the most part unknown, or foreign to the countries in which they are found—these vast deposits which cover so many plains, and fill the bottoms of caverns and clefts of rocks, deposits which took place when the hippopotamus, the elephant, the rhinoceros, the horse, the ox, and the deer were the prey, even in our climate and soil of England, of the hyena and the tiger—have been carefully distinguished from the alluvial deposits containing the remains of animals common to the country in which they are found; and are now regarded as the most convincing proofs of an immense and ancient inundation. The alternate fresh and salt water formations between this diluvium and the chalk have been accurately discriminated;

and more particularly the great fresh water deposit, the gypsum, in the neighbourhood of Paris, in which, besides complete skeletons of many species of birds, entire genera of land animals have been discovered which have been found nowhere else; and which, as well as the trunks of palm trees and other productions of a tropical climate, with the bed which envelopes them, repose on a marine formation no less productive of shells, chiefly of unknown species. Bones of reptiles lie beneath this marine layer; of crocodiles and tortoises: but the mammiferous remains do not occur, and at the era of this layer did not exist, at least in that situation. Beneath this last fresh-water formation lies the chalk. But it is above this chalk formation, and between it and the era of the general deluge, that the explanation of the earth's history has been sought and found. Far beneath the chalk have been found, and chiefly in England, the remains of gigantic reptiles, crocodiles, pterodactyli, the icthyosaurus, the plesiosaurus, the megalosaurus, and others of the lizard tribe, the remains of an ancient era equally distinct. Lower than these are laid the vast deposits of former vegetables, coal retaining the impressions of palms and ferns, which show that even at those depths there once was dry land and vegetation, although no bones of quadrupeds are found there; whilst lower still the naturalist traces the first forms of existence, the crustaceous animals, zoophytes, and mollusca of a world yet almost inert and lifeless.

This department of enquiry is one in which Cuvier reaped an undisputed fame. A long line of distinguished naturalists, down to our own Hunter, had prepared the way for his arrangement of the individuals of the animal kingdom; and his claim to the highest honours as a systematic naturalist may be, and has been disputed; but the particular mode of surveying the composition or structure of the subjects of that extensive kingdom; the persevering research pursued in conformity to that mode, and its application to the fossil remains which had before been little more than objects of marvel, opened a new and rare volume to the reader of nature—a book sealed until his time—hieroglyphics solemn and instructive, but illegible until he surveyed them.

Before Cuvier, naturalists would seem to have been deterred from the attempt to classify the fossil bones of quadrupeds by the extreme difficulty attending it. The remains of other forms of animals, and the remains of vegetables, were less incomplete and less repulsive; and it was seen and acknowledged that they belonged to species either now unknown, or unknown in the regions of the earth in which the fossils occurred. So much concerning them Leibnitz had established; and this knowledge was by Buffon wrought into sublime but premature conjectures. Cuvier advanced to the subject more calmly, well aware of its bearings, and of their importance, but only therefore so much the more impressed with the necessity of making every step in the investigation of it secure before advancing farther.

From the imperfect fragments of fossil quadrupeds he thus elicited striking testimony of the early changes of the earth's surface, and materials for the history of its first and darkest periods: those periods concerning which even great philosophers had been content before with the wildest speculations. The large deposits of marine fossils, with which observers were previously familiar, did but prove that the surfaces whereon they were found were once the bed of the sea, which tranquilly allowed their accumulation. The discovery of a fossil quadruped in any layer proved the more important circumstance, that that layer must once have been the surface of a firm land, and indicated more and greater changes than a mere retiring and subsidence of waters. Cuvier addressed himself to the arduous task of arranging and describing, or rather of interpreting these quadruped remains, always less perfect than the marine fossils, presenting faint traces of the original forms to which they belonged, and, even when most complete, being still nothing more than the osseous portion of the structure of animals of which the characters were in other respects as varied as are those of the species now living. Attaching himself to one great principle, the natural *relation* of forms in organised beings, he conceived that by careful examination each fragment might be made to indicate the whole to which it belonged, and with the system of which it would always be found to have a correspondence. If, he reasoned, the intestinal structure of an animal is prepared for the digestion of flesh, and that recently killed, its jaws must be so constructed as to devour, and its claws so formed as to seize and tear it, and its teeth to cut and divide it: all its structure must be adapted to pursuing and catching its prey, and its perceptive organs must be fitted to discerning that prey afar off. Such must be the general character of carnivorous animals. As the general characters are connected with these general arrangements, so also for the particular characters by which their subdivisions are distinguished, there will still be found suitable arrangements; and the class, the order, the genus, and even the species may thus be determined, although the observer has never seen the animal entire. A jaw of a certain force must have a suitable articulation and a sufficiently large temporal muscle, indicated by the hollow formed in the bone for its reception, and by the convexity of the strong zygomatic arch. An animal which carries off its prey must have strong muscles to raise the head, and the form of the vertebræ or of the muscles attached to them, and of the occiput, must correspond with the intention. Similar reasonings were extended by him to the structure of the teeth, of the claws, of the extremities, of the foot or hoof. The foot-mark became an indication of the structure of the teeth of the unknown animal, of its jaws, its vertebræ, and its general form and frame.

It would be difficult to point out a more beautiful or more successful application of the principles of scientific observation. The results were proportionable to the excellence of the method. Its correctness, from a sense of which Cuvier never allowed the seductions of imagination or the love of mere system to lead him astray, was first and frequently tried on portions of known animals, afterwards applied to fossil bones, and in both

with a success so remarkable as to appear to justify the term infallible, which, cautious and philosophical as he was, he felt himself warranted in applying to it. His associates of the Institute heard, we are told by M. Pariset, with surprise and doubt the first enumeration of some of these results, and their credulity sometimes only gave way to the accidental discovery of some quadruped, of which Cuvier had adventured the description on the basis of a few fragments.

His extensive, we might perhaps say, his universal, acquaintance with the diversities of animal structure actually existing, would have given to the merest conjectures of Cuvier concerning the remains of extinct animals a great degree of weight; but he was not of a disposition to be satisfied with conjectures. He applied to these reliquiæ of an unknown era of the globe the same faculty of close attention, the same industrious research, the same severe comparison, which he had already exercised on the perfect forms of animal existence presented to the senses, and thus assigned to each dim remnant its place in frames no longer seen in perfection, and to each frame or structure, thus rebuilt, its place in nature and its habitation. Thus he became the great antiquary of the earth. He learnt the characters of that obscure time when first this planet became the abode of locomotive organisations; and established an order of facts bearing a date anterior to that of the history of man, and far before the half hidden ages of those ancient empires which have themselves become as much the domain of fable as of history. From the burial of many centuries he called up the forms of things unknown, and made them familiar to the men of the present time, who for once were constrained to admit the evidence of one to whom might almost be applied the designation of the "witness of the deluge."

The results of the investigations instituted by M. Cuvier were twofold. The description of one hundred and sixty-eight fossil vertebrated animals, forming fifty genera, of which fifteen were new, comprehending animals belonging to every order with the exception of the quadrumana, was the addition thus made to zoology. What light was also thrown on geology during these researches is briefly and well stated by M. Laurillard:—

"The strata called primitive, on which all the others repose, containing no remains of life, teach us by that circumstance that life has not always existed on our planet. Whether it was that the temperature of the globe was too elevated to permit it, or that the materials necessary to the support of organic existence were not yet prepared, there was a time when physical forces alone acted on the land and on the sea, in which all the wonders of organisation were subsequently developed.

"All organised existences were not created at the same time: vegetables seem to have preceded animals; molluscous animals and fishes appeared before reptiles; and reptiles before the mammalia.

"The species which formed the ancient animal population have been destroyed and replaced by others; and the actual animal population is perhaps the fourth series.

"Geology at length possesses a guide to the obscure labyrinths which it is obliged to tread, and a new method of determining the nature of strata, often established with difficulty by chemical analysis or the order of superposition.

"Besides the general facts which naturally flow from these discoveries, which M. Cuvier discusses with the logical power and intelligence which were characteristic of him, in the Preliminary Discourse of his work, science soon obtained results positively important. For almost as soon as geology had found this guide, it became demonstrated that the stratified layers of the globe's crust were divisible into two classes, one formed by fresh water, and the other in the waters of the sea. This distinction, which could only be effectively made by geology, led to the demonstration of a fact not less curious; namely, that several parts of our earth have been alternately covered by the sea and by fresh water."—p. 20.

In the prosecution of the enquiries which led to these conclusions, now, we believe, generally admitted by philosophers, M. Cuvier was indefatigable. No personal labour or sacrifice was spared. Of the large collection of fossil remains, crowded into one of the rooms in the museum of the Garden of Plants, many were presented to him, but many were bought, and at no small expense, and placed by him in the public collection without reserve. Surrounded by these collections, he deciphered their characters, and, that the sceptical might in all countries satisfy themselves of the correctness of his descriptions and his views, he caused casts of the principal specimens to be made and sent to the different European museums, from which similar representations of rare specimens were received in exchange.

Whoever, yet a student, burns with the noble desire of emulating such services to science, should carefully peruse the details which M. Cuvier gives in the course of his works of the means by which he achieved them. The care with which he traced every fact, the progress of his ideas from suggestion to conviction, the perseverance, the candour, the modesty of the great enquirer, will present the most useful lessons. If the quarries of Montmartre, with their fossil treasures, seem to have been made for him, the diligence with which he explored them affords an example which all may follow in proportion to the opportunities they possess; and still was no more than he already, with no mean reward of scientific truths, practised on the solitary shores of Normandy. His senses, naturally accurate and faithful in the highest degree, and his judgment, equally calm and profound, had yet been exercised with perseverance on many natural objects before he attained that perspicuity and power of combination which enabled him to construe the smallest traces of animal organisation, embedded in blocks of gypsum, and rescued from the destructive operations of the workmen, into the full outline of animals, which his genius thus almost brought back out of the oblivion of ages into freshness and life.

To any one who indulges his solitary thoughts with the hope of enriching any part of the wide domain of natural history, an object eminently worthy of rational and contemplative beings, we would recommend the diligent perusal of the introductory essay of the great work in which the fossil remains are described; known to the English reader as a *Discourse on the Revolutions of the Globe*. Cuvier is there beheld, if we may so

say, advancing to his great task with a full consciousness of its extent, and of the additions which would be made by future enquirers even to his own discoveries; but at the same time with the confidence of one who enters on a region which, although obscure and encumbered, he has carefully prepared himself to explore. He designs, from the first, to show the relation between the history of the fossil bones of terrestrial animals, and the theory of the earth; to expose the principles by which the character of those bones was decided; to show how far the species of the animals to which they belonged differ from existing species; to ascertain the influences of time and of climate; and thus to demonstrate that the differences must have been connected with extraordinary events as their causes. On these observations he builds up a new system of the ancient earth, not the offspring of fancy, but the result of philosophical inductions from facts carefully established; and which will bear the test of comparison with all the civil and religious records of man.

From remarks made on phenomena common to all localities, but described by him with singular clearness and grace, he leads the reader to the view of the most stupendous movements which the earth has undergone. He shows that these changes must have been numerous and sudden; that some took place before there were living beings on the globe we inhabit, and some after it was inhabited. By an examination of the causes now in operation effecting changes in the earth's surface, he went far to show that none of these could have produced such changes as the structure of the earth proves it to have undergone. Briefly reviewing previous theories, he points out the great error of them all; the omission of some facts, the assumption of others, and the consequent fallacy of the conclusions. Doing no injustice to the great geologists who had already surveyed the mineral character of the earth with such admirable care, as Saussure and Werner, the first of whom had studied it among the sublime illustrations of the primitive and secondary layers afforded by the Alps; and the latter in the older [illegible]es, where were less confusedly written the l[illegible]elating to the succession of layers; he point[illegible] that neither of them had determined the fossil organic remains in each variety of layer with sufficient exactness; whilst the naturalists, who had paid more attention to the remains and described many of them, had neglected for the most part to consider the general laws which regulated their position, and the relation of certain fossils to certain layers.

To accomplish this, indeed, required a combination of kinds of knowledge not often possessed by one individual; a power of comprehending almost infinite details, and of taking the most enlarged survey of their relations; the observation of a naturalist in the widest acceptation, and the profound meditation of a mind of the most philosophical order.

After explaining the importance of fossils in relation to geology, and of the fossil bones of quadrupeds in particular, the application of which to the subject we have already noticed, he enters with much learning on an enquiry respecting the probable existence of species on the earth at this time, resembling those of which we possess the fossil remains; and leaves the reader in no degree of doubt that all the large animals of the old continent which are now known were known to the ancients; and that those which, although described by the ancients, the moderns have never met with, were fabulous. Proving that all the great animals of the old world soon became known, not only to the people of the interior, but to the inhabitants of the coasts, he puts aside the expectation that the recesses of the vast continent of the new world contain very large species yet to be discovered, resembling, for instance, the megatherium or the mastodon. If, therefore, he observes, it be proved that the fossil remains of the great species of quadrupeds are not similar to any species now living, it is not to be said that the species resembling them are yet hidden in deserts, but must lead to the admission that this diversity arises from some great general cause worthy to be studied.

We have, in the previous part of this article, mentioned some of the results of the method of enquiry followed by Mr. Cuvier; the discovery of many new species, several of which belonged to new genera. Of the new species, about a fourth were oviparous quadrupeds, the others mammiferous, and more than half belonging to non-ruminating hoofed animals. But that which Cuvier himself considered of much more importance, as throwing light on the theory of the earth, was to ascertain the layers in which particular species were found, so as to reach the general laws of their position. For the details, which show these laws clearly and convincingly, the reader must be referred to the work on which we have dwelt with so much pleasure, and which must always be referred to with a new delight.

The curiosity of readers, whatever may be their pursuits, who look into treatises relating to the vestiges of the antediluvian world, is ever naturally directed to enquiries respecting the existence of any remains of their own species. Knowing, from the sacred records, that man existed on the earth before the great deluge, the enquirers have reluctantly believed that among the numerous fossil remains discovered in different parts of the earth, no bone of man has ever yet been found; that no human remains have ever met the eye of the fossil geologist. It neither lessens the difficulty of the explanation, nor consoles the vanity of man, to know that the same deficiency exists as regards the bones of the monkey tribe; that the whole tribe of the quadrumanous animals, as well as the single bimanous animal, are excluded from the antiquity implied by the fossil remains of so many animal forms.

That portion of Cuvier's preliminary discourse on fossil remains which relates to this particular enquiry is not the least convincing proof of the author's philosophical method of investigating an obscure subject. It is evident that he first satisfied himself that no human remains had ever occurred in any regular stratum; and that those which had

been asserted to be such, as the famous *Homo Diluvii Testis* of Haerlem, and the skeletons discovered at Guadaloupe, were either, as in the first instance, the remains of an animal, or, as in the second, occurred in the recent depositions in the clefts of rocks, or in the soil of caverns, with no pretensions to an antediluvian date. But not content with this negative evidence, he applied himself to collect evidence of a different nature. The question may be said to be one of extreme interest; for it points to the successive stages of that mighty work recorded by Moses, and to that time, to us inconceivable, when "there was not a man to till the ground," and man was formed out of the dust, and the breath of life was breathed into his nostrils, and he became a living soul. We have no intention of straining any points to show how far philosophy agrees with the Mosaic record; but no student of modern geology can fail to perceive certain striking coincidences between the order in which the fossil remains occur and the recorded order of the creation. It was not, we presume, the intention of Moses to teach all at once that natural science, the gradual acquirement of which is a constant source of human industry. But as the earliest traditions of man were scanty, and likely to be lost as human evidence, it does appear as if Moses had taken pains to preserve them. His narrative is remarkable for a force and sublimity of expression worthy of the singularity and greatness of his subject. Where he is fully understood, can it be said that geology contradicts him? does not rather the progress of that science throw unexpected elucidation on his record, and encourage the belief that when we know more, we shall read those primary annals of the globe in a more enlightened spirit? As it is, they certainly seem to speak of the earth's antiquity compared to the age of man; of man's infancy compared to the age of the earth on which he was from the first destined to live. Geology speaks the same language. The primitive layers attest the earth's first desolation. The transition lime-stone renders up the remains of the lowest forms of existence, of species now unknown save in those buried strata; the chalk and clay offer their fishes, their reptiles, and their quadruped, the beings of a former order of things, all of which have disappeared from life. No fossil remains present perfect analogies with living species; but the actual type is gradually approached in the layers of least antiquity. But still, among the fossil remains no vestige of man or his works appears. Again and again the workmen of Montmartre announced the remains of man; but, submitted to the inspection of Cuvier, the pretended wonder vanished, and the true relation of the fossil in dispute was established with some lower species. All the evidence to be derived from an inspection of the structure of the earth, and the oldest written records, concur to prove that there was a time when, although this globe revolved as now it does, and day and night succeeded each other, the light of the morning roused no man to life, to pleasure, or to toil, and the light declined at eve with no human eye to regard it, and no human heart to be affected by it.

> "There wanted yet the master work, the end
> Of all yet done; a creature who, not prone
> And brute as other creatures, but endued
> With sanctity of reason, might erect
> His stature, and upright with front serene
> Govern the rest, self-knowing; and from thence
> Magnanimous to correspond with heaven."

Either man did not exist before several of the revolutions undergone by the globe, or his bones lie yet unburied at the bottom of the present seas; for the revolutions which have laid open the strata in which former revolutions had enveloped fossil bones, strata exposed in Europe, in Asia, and in America, have never yet disclosed a fossil bone of man. Yet that man existed before that great catastrophe of which traditions exist in every part of the earth, we know from such universal traditions, and from the oldest record possessed by man. This record, Cuvier observes, bears the date of about 3300 years before our own time, and it places the deluge twenty centuries before its own date, or about 5400 years since. No tradition accords man an antiquity greater than that to which our antediluvian records lay claim; and it is only after the time of that great event that we perceive men collected into societies, and observe the birth of arts and of sciences. Of none of the nations of the West can the chronology be carried farther back than 3000 years. The nations of the north of Europe have no annals which extend higher than the period of their conversion to Christianity. The histories of Spain, of Gaul, of Britain, almost begin with the time when the Romans overran those countries. The Greeks were unacquainted with the art of writing until taught by the Phenicians, about thirty-three centuries ago, and their previous history, doubtful as it is, does not ascend more than three centuries higher. The largest credit given to the records of Western Asia will not give them a date older than forty centuries. Herodotus, the earliest extant profane writer, with the exception of the poets, lived but two thousand three hundred years ago, and the earlier historians whom he consulted were only one hundred years old. Homer was but five hundred years before Herodotus. The claims to a much higher antiquity on the part of some nations, as of the Hindoos, rest on authority of the least credible kind, and are contradicted by the most authentic of their own records. The astronomical monuments of the ancients, when critically examined, do not attest the very remote dates by some assigned to them.

To probable evidence of this kind drawn from civil history, in the collecting of which Cuvier displayed great erudition, and in estimating it great sagacity, he added some of a kind drawn from the calculation of the periods of certain natural changes actually known to be going on upon the earth's surface. Marking the heights of the beds of the rivers above the surrounding country, as of the Rhine in Holland, and the Po and Arno in Italy, and the Loire in France, and the deposits at their mouths; changes effected by the progress of sands, as in the Bay of Biscay, where the sand advances annually sixty feet, and must reach Bordeaux in about two thousand years; and again in parts of Egypt, once fertile,

but now buried in sands brought by the winds from the sterile lands of Lybia, and which have already entombed temples and cities, even since the conquest of the country by the Mahometans, leaving the monumental tops of mosques and minarets still visible; the formation of bogs and other alluvial changes, including what are called slips, or the falling of *debris* from the face of hills and rocks, of which Professor Jamieson adds the illustration, when translating this portion of the work, of the Salisbury crags near Edinburgh, of which the vertical face is not yet hidden by the annually increasing mass which falls from it to the base: all these, and many other circumstances are adduced as so many proofs of the probable date of the last great revolution, and, consequently, of man's recent existence upon the earth; a conclusion according with those which are perhaps considered by geologists as the least uncertain of any to which their science has yet conducted them. Every where, and however interrogated, observes Cuvier, nature speaks the same language, and tells us by natural traditions, by man's actual state, by his intellectual development, and by all the testimony of her works, that the present state of things did not commence at a remote period. He agrees, he says, with the opinion of MM. Deluc and Dolomieu, that if there be any thing determined in geology, it is, that the surface of this globe was subjected to a great and sudden revolution, not longer ago than five or six thousand years: that by this catastrophe was caused the disappearance of countries formerly the abode of man, and of species of animals now known to us; that the bottom of the sea of that time was left dry, and upon it were formed the countries now inhabited; and that since that epoch the few of the human race who were spared have spread themselves over the world, and formed societies. But he also believes that the countries now inhabited, and which that great catastrophe left dry, had been at some former period inhabited land, the abode, at least, of land animals, which were destroyed by some previous deluge; and that they had even suffered two or three such visitations, which destroyed as many orders of animals.

Throughout the various discussions incidental to the great investigation to which the essay on the revolutions of the globe is devoted, we cannot but admire the unalterable patience and rare sagacity with which so many facts, collected from natural observation, or gathered from the stores of ancient and modern learning, or discovered by modern science, are compared together. M. Pariset justly observes, that neither the grandeur of the subject, nor the dazzling novelty of many of the phenomena elicited in its pursuit, led the severely philosophic mind of Cuvier into unguarded hypotheses. Every where we remark the simplicity of a great historian of nature; the tone, not of a prophet, or of one inspired to treat of a mighty theme, but of one who knows how elevated is that theme, and yet hears, and dispassionately balances, and unaffectedly relates all that his study and long meditation have taught him. His mind is raised and excited by the great views that break upon him as he advances, but never discomposed; he knows the value and the greatness of the truths he discovers, but beyond them he sees other truths, to him and to his age denied, yet to be won by the research of those who shall begin where he, obedient to the laws which limit the range of the most powerful among mortal minds, knows that he must leave off. So strongly is this philosophical character imprinted on all that Cuvier has written, that the mere perusal of his writings seems for a time to withdraw the mind from less worthy pursuits, or the wandering course of unsettled studies, to a holy retirement, wherein some sage interprets the laws of the Great Creator, by pointing to his works, unregarded before, or not understood.

"The book," says M. Laurillard, "which contains these profound researches, became, like his Comparative Anatomy, his Animal Kingdom, and his Anatomy of Molluscous Animals, classical from the moment when it appeared, and will, we think, remain so as long as man shall seek enjoyment in the study of nature, and meditate on the questions to which such a study shall give rise. It will always remain a model of criticism and rigorous analysis, and a perfect example of that talent which consists in saying in a few words all that is necessary to be known; an art of compressing or of summing up which only exists combined with extensive knowledge, and which M. Cuvier always shows that he possesses in a very high degree. There is nothing listless in his works; there are no digressions beyond the limits of his subject; and yet there is nothing of dryness, and there are no omissions. We have seen young naturalists reading his Anatomy of the Molluscous Animals with unfeigned pleasure, and also the osteological descriptions in his Researches concerning Fossil Bones; and we have known students recur to what he says of human anatomy in his *Anatomie Comparée*, for clearer explanations than they could find in the books of the schools. In short, if we survey all his writings, we every where find the unfailing marks of true science, profundity, clearness, and precision. His first lecture on Comparative Anatomy presents all that is known concerning organisation, all physiology: his introduction to the Animal Kingdom offers the clearest analysis of its zoological distributions, and all that it is possible to say of arrangements; and, lastly, the Preliminary Discourse on Fossil Bones exposes with admirable exactness the principles of the harmony of forms, and all the theories respecting the formation and revolutions of the globe; and includes a complete summary of the historical documents on which are rested the claims of different nations to a high antiquity."—p. 22.

It should not be forgotten, that in the prolonged task of interpreting and delineating the fossil bones, M. Cuvier had two most able assistants, and that one of them was M. Laurillard; the other was M. Rousseau, whose son at present holds an important office in the anatomical school of Paris. M. Laurillard does not speak of himself, and his merits need no eulogy of ours; they are sufficiently attested by the confidence which Cuvier placed in him, even to to the day of his death, when he was charged with the publication of the Catalogue of the Museum of Comparative Anatomy, and of the drawings illustrative of it, executed by Cuvier or by himself; a publication for which all anatomists will look with impatience. This was part of the elaborate preparation for the great work on the Anatomy of Animals, on which Cuvier was occupied up to

the hour of his fatal illness, to which he considered all his previous works but introductory, and the interruption of which was one of his latest objects of regret.

There was, perhaps, no finished undertaking of his laborious life, to which Cuvier himself attached more importance than his researches into the fossil remains. It began with his discrimination of fossil and living elephants in 1796, and was never afterwards quite absent from his mind; whether in his study or on his journeys, he directed his observations to these remains, until he obtained a key to the perusal of the impressive story which they revealed; he spared no labour and no expense in this pursuit; he rejoiced over every new load of fragments brought from Montmartre to the Museum; he copied many with his own hand, and, at a time when to avoid expense was necessary to him, he had once determined also to engrave them all himself, and among the engravings of the third volume of the last edition some of these valuable plates are to be found. These M. Duvernoy informs us, which to most readers would seem additionally valuable, are marked CV.

And, at the close of all his labour, he thus expresses himself:—

"I have no doubt that in a few years the work which I now terminate, and to which I have devoted so much labour, will be but a trifling sketch, a first view (un premier coup d'œil) thrown over these immense creations of the ancient time."

So, indeed, it may be. In the eternal chain of human discoveries, the researches of the most gifted minds do but form links, which lead on to other links to which they did not themselves attain, and to be prolonged through all the future ages of the present species. Already has it been made at least probable that a new reading may be given to the theory, the history and chronology even of the primary strata of the earth, and much that is superimposed on them, or which they have broken through. The history of animal life may yet have been restricted within too narrow bounds of time. It may be that, as regards *time*, "the confines of the universe lie beyond the reach of human ken;" and that "to assume that the evidence of the beginning or end of so vast a scheme lies within the reach of our philosophical enquiries, or even of our speculations, appears to be inconsistent with a just estimate of the relations which subsist between the finite powers of man and the attributes of an Infinite and Eternal Being."* Yet, by the exercise of faculties evidently intended for such enquiries among others, man has attained to a few facts which appear certain; and whatever development the unwritten history of the globe may subsequently undergo from geological research, posterity will never forget its obligations to Cuvier, who translated so much of the obscure language in which many of the secrets of the early earth were hidden, and so many are perhaps yet to be discovered.

The conclusion of his work on Fossil Remains was but the prelude for the commencement of his great work on Fishes, of which the copious account given in a recent number of this journal (vol. xiii. p. 355) dispenses with our saying more in this place.

The four works to which our preceding observations have been confined, namely, his Comparative Anatomy, his work on Fossil Remains, his Animal Kingdom, and his Natural History of Fishes, are of such extent, and required such research, that any one of them would have conferred upon its author a very high rank among natural philosophers; yet these formed but a small part of the wonderful labours of Cuvier. His writings are, indeed, so numerous, and the subjects of them so various; they are many of them so intimately connected with his history, and were so entirely called forth by the offices he had undertaken in the state of which he was a subject, as well as in the republic of science, that his biographer has been satisfied to give an accurate list of them, with their dates; and the enumeration of titles alone extends to several pages. We can but mention a few of them. One, to which he attached much importance, and to which he had devoted many days and nights, was his Anatomy of the Mollusca, published in 1817, which contained many new and interesting facts respecting a neglected class of animals, to which he had assigned a higher place than former naturalists. This work was illustrated by fine engravings, after his own drawings. He unravelled the structure of these animals in water, displayed their delicate parts, and fixed them by means of pins on pieces of wax; a method which has, we believe, greatly facilitated the examination of such minute subjects. Of this work it was his intention to publish a new and enlarged edition.

Among the subjects which at different times occupied his attention was that of the organ of voice in singing birds. The introduction of this subject at the institute was attended by a curious illustration of the propriety of investigating it. Physiologists, Cuvier observes, were not agreed concerning the mechanism of the human voice, which some compared to a wind instrument, and others to a stringed instrument. This observation was not allowed to pass uncontradicted. A celebrated anatomist, who was present, declared that it was a mistake to consider the question undecided, for it was generally agreed that the human voice was a wind instrument. Another anatomist immediately exclaimed that this was quite erroneous, for the organ of voice was a stringed instrument, and thus, much to the amusement of the audience, confirmed M. Cuvier's first assertion.

His Memoir on the Nutrition of Insects we have already mentioned among his early productions. In it he established their claim to separate classification, and explained the real object of the singular disposition of their respiratory organs, as well as their peculiar mode of nutrition; showing that the nutritive molecules, separated by the alimentary canal, are exposed immediately to the action of the atmospheric air, which penetrates to them by means of canals or tracheæ, ramified through all their parts, and are thus rendered fit for the support of existence. The observation of these arrangements very probably suggested, as

* Lyell's Principles of Geology.

M. Duvernoy remarks, those ideas of the relations of the circulation and respiration, and of the quantity of respiration in the different classes of animals, ever in direct proportion to their muscular force, and the quantity of movement of which they are capable in a given time—ideas which prepared the foundation for his general arrangement of animals. Certain it is that he always attached a high importance to the minute anatomy of insects; to which, when on one occasion an ardent but inexperienced student of anatomy came to him to announce a supposed anatomical discovery, he referred the young enquirer, as at once the best preparatory exercise and test of his exactness. The test, it is added, proved satisfactory, convincing the too hasty student that his first conclusion, and his consequent discovery, were but pleasing delusions.

That in addition to the philosophical researches which we have enumerated, Cuvier should have found time to be a most laborious public functionary, and in more than one department, would scarcely be deemed credible, if he had not left indisputable proofs of it, and of various kinds. Yet nothing indicates that by undertaking so much, any thing was neglected. Follow him where we may, we trace him by works worthy of his genius and his accomplishments. His duties, as one of the secretaries of the Institute, were in themselves arduous and difficult, demanding extensive knowledge, which he showed that he possessed, whilst he threw over it all the attractions of language and manner. In addition to the ordinary routine of the weekly sittings, of which the two secretaries kept exact minutes, an annual account of the proceedings, including succinct notices of innumerable scientific communications, was a part of their duty at the great annual meeting, when also were pronounced those admirable *Eloges Historiques* of the most distinguished deceased members of the Institute, both native and foreign, in which he displayed a most varied acquaintance with science, and a noble and touching eloquence. He also partook of the ordinary duties of the section to which he belonged, particularly of that of reporting concerning papers presented by authors, a task demanding not only great knowledge, but a correct and impartial judgment. In the performance of this task, his power of conveying the peculiar views of the different writers with clearness and order was so remarkable, that the authors not unfrequently acknowledged how much they were indebted to him; while in the justice of his observations, even on subjects involving some of his own opinions, he evinced the dignified modesty and rectitude of a great mind. During the consulate, Napoleon was elected president of the Institute, and was thus brought into frequent communication with Cuvier, whose powers so acute an observer of men's capabilities could not fail to appreciate. He appears to have honoured him with his entire confidence, of which the result was, not unfrequently, some additional duty imposed upon him by one accustomed to find individuals ready to obey every command.

"All my labours," says Cuvier, in a letter written to M. Duvernoy in 1808, "are almost arrested by a work which the emperor has required of the class, and which has been assigned to me, for the most part, as secretary; it is a history of the march and progress of the human mind since 1789. You will easily judge how complicated the business is as regards the natural sciences; and although I have already finished nearly a volume on the subject, I am far from being at the end of it; but this history is so rich, and so abundant in fine discoveries, that I have become interested in it as I proceeded, and perform my labour with pleasure. I trust that it will be a striking piece of literary and philosophical history. Above all, I endeavour to point to the true views by which ulterior researches should be directed."

The work here referred to he afterwards continued and completed up to the year 1826, under the title of the *History of the Progress of the Natural Sciences, from* 1789 *to the present time;* and in that shape it forms an invaluable addition to the immortal labours of Buffon. His annual reports, read before the Institute, beginning with 1812 and continued up to the time of his death, comprehending an analysis of the labours of its Physical Class (subsequently denominated the Academy of Sciences), contain a clear exposition of the progress of physical science, and the discoveries made in it by the members of that illustrious body, and by learned foreigners, who were in correspondence with it. These analyses embrace meteorology and general physics; chemistry and physics properly so called; mineralogy and geology; vegetable physiology and botany; anatomy and physiology; zoology; travels connected with the advancement of the natural sciences; medicine and surgery; the veterinary art, and agriculture.

The *Eloges* alone would furnish subject-matter for very extended remarks. Singularly eloquent, but composed in a style remote from the inflated models of the agitated period which had just passed away, each of these discourses contains simple and elegant details, yet most instructive and even profound, of the labours of the individual of which each is commemorative.

Of his public lectures we have hardly spoken; yet they demanded, no less than his other undertakings, the exercise of all his acquirements, and of the rare qualities with which he was endowed as a teacher. Whether lecturing at the Pantheon on the elements of natural history, at the Jardin des Plantes on comparative anatomy, at the College of France on the history of natural philosophy, or at the Lyceum or Athénée on subjects selected for a cultivated audience, accustomed to the eloquent literature of Laharpe, he was never superficial and never tedious. His vast comprehension seemed for the time to be communicated to his hearers, and he led them without fatigue, to the most elevated views.

"His lectures on Comparative Anatomy, at the Jardin des Plantes, attracted a most numerous auditory to the immense amphitheatre. Every ear was attentive to catch the oracles which he pronounced concerning organisation and its laws. The mind was captivated by the wonders which he related, with that strong sonorous voice, which penetrated in all directions to the extremities of that large lecture-room. His easy elocution, expressing what a just and rapid conception had discovered, and with equal simplicity and clearness, shed intelligence

over minds of every description; and numerous preparations from the Museum, exhibited to the hearers, rendered his oral demonstrations additionally luminous. These means of conveying instruction were wonderfully multiplied by sketches which he drew with inconceivable rapidity, and, as it were, without any interruption of his discourse; a term which would seem to have been created to express the character of his lectures, which were indeed connected discourses, although delivered extemporaneously, from brief notes. His ideas were unfolded in perfect order, without the slightest hesitation, or the least repetition: the proper word was always employed, without formal effort, or any other design than that of instructing. But the wonders of organisation, so well displayed by his genius, gave an interest to his instructions, and excited an enthusiasm, which still reanimates one who, more than thirty years ago, had the happiness to hear them, and who would vainly wish to make those partakers of it, who have been deprived of such an advantage." —*Duvernoy*, p. 73.

His lectures at the college were no less attractive; and the last which he delivered there, only the day before he felt the first symptoms of the fatal malady which put a period to his life within the same week, was a review of the progress of science, from the first formation of societies, a subject which he treated in a manner so masterly and with so much sublimity, as to impress his hearers at once with the idea that they heard a second interpreter of God's creation, and with the solemn and affecting idea that they were listening to him for the last time. We do but employ the language of others, and if it appears exaggerated, the cause is to be found in the deep effect unquestionably produced by this last grand discourse, concerning which all the testimony is the same.

A life of thought and toil had made its impression on Cuvier, although his constitution was apparently robust in his latter years. He had also been subjected to one of those trials, which more than years or toils advance men into the woes of age. His only daughter, young, beautiful, and highly accomplished, worthy, in short, of her father, and most affectionately beloved by him, died of consumption within a short period of her marriage. It is a sad and oftentimes repeated story in human experience. "O triste plane, acerbumque funus! ô morte ipsa mortis tempus indignius! Jam destinata erat egregio juveni, jam, electus nuptiarum dies, jam nos vocati. Quod gaudium, quo mærore mutatum est!" Such were the terms in which it was deplored two thousand years ago; and still such griefs fall heavily upon the human heart, even though sustained by the highest philosophy and resignation. The blow had been severely felt, and perhaps Cuvier never wholly recovered from its effects. His spirits, his manner, his general appearance might show something of it, and it is so natural to be quicksighted to danger threatening those whom we reverence or love, that slight signs, and circumstances hardly capable of expression, might awaken fears on which the fatal event, so immediately supervening, seemed to follow as on intimations almost prophetic.

In addition to all that occupied the life of Cuvier as a philosopher, an anatomist, a professor, and an author, he was early named to public appointments connected with popular education; and perhaps no individual in Europe entertained on this subject views at once so just and profound. In 1802 he was named by the emperor one of the six inspectors-general of the Lyceums, and in 1808 he became counsellor of the Imperial University; in 1809 and 1810 he was charged with the organisation of academies for the states of Italy, then united to the French empire. It is difficult to reconcile the idea of unmitigated tyranny, which many writers have so carefully associated with the name of Napoleon, with the provision for popular education indicated by the selection of Cuvier for this duty. In 1811 he was sent on a mission of enquiry concerning the state of public instruction in Holland and in Lower Germany; and in 1813, although a protestant, on a similar mission to the states of the church; with the design also of modeling the establishments of public instruction according to the system of the university of France. It was whilst on this journey of inspection that the emperor named him to the office of *maître des requêtes* in the council of state. During the various tours which these duties occasioned, M. Cuvier neglected no opportunity of increasing his knowledge of natural history and of fossil remains. His delicate and difficult duties as regarded the seminaries of public education were performed with as much feeling as judgment. He constantly strove to preserve what was valuable even in faulty institutions, and he felt the veneration of a great mind for places which great names had rendered sacred.

"Who," said he, in one of his reports, speaking of the universities of Tuscany, "who would have the courage to interfere hastily with institutions founded and sustained by so many great men? And when we reflect that the teaching of civil law was established in Tuscany by Irnerius and Bartholius; that medicine has possessed there a Vidius, a Columbus, a Fallopius, a Mercurialis, and a Redi; that Galileo there demonstrated physical science; that Michelius and Cesalpinus there taught botany; that from those schools proceeded Dante, Petrarca, Machiavelli, and Guicciardini; and that their great artists, statesmen, and even princes, were as conversant with literature as their scholars by profession; are we not rather inclined to respect than to criticise, and ought we not, above all things, fear to propose a rash reform?"

Talents, so eminent as those of Cuvier, united with so much dignity of character and so much experience, were indispensable to France under all the successive changes of government which happened during his life time. The consulate, the imperial government, the restoration, the monarchy of July, did but anew direct public attention to the civil services of a man whose attainments and whose sagacity were for all time. Subservient only to good and great designs, worthy of his exalted intellect, he was a favourite of the consul, of the emperor, of the restored sovereigns, and of him whom the people elected; and yet independent; for what could governments or kings do for Cuvier? Undistracted by all the changes that befel his country, he was ever occupied with her best interests; ever laboriously endeavouring to diffuse that mental and moral pre-

band, and worthy of the warmest praise showered upon her by his admiring friends.

Cuvier's demeanour at the Institute was, perhaps, somewhat stately, not always without a slight admixture of impatience; sometimes, indeed, accounted for by the frivolities occasionally mixed up with the proceedings even of the most scientific assemblies, when they consist of numerous members; but sometimes a little too repressive, or to a foreigner appearing so, of the lively and intelligent sallies of young members who were yet not quite undistinguished. His tones, on such occasions, commanded immediate attention; and a few simple words from him seemed at once to settle points about to be vivaciously disputed; whilst his manner was very dignified, and that of one who strove, not without success, to repress a constitutional irritability; an irritability, compatible, it must be remembered, with such patient attention to minute details as few were capable of.

But a few years have gone by, and all this has passed away! and Cuvier, and many of the great men who then surrounded him, like the emperor who once presided in that hall of science, have been removed like so many unreal and shadowy things; leaving their works for our contemplation, to be viewed apart from the radiance of false glory which was once shed over them, and judged by the simple standard of the good they effected.

To civilise large portions of mankind; to "lead the mind of man to its noble destination, a knowledge of the truth; to spread sound and wholesome ideas among the lowest classes of the people; to draw human beings from the empire of prejudices and passions; to make reason the arbitrator and supreme guide of public opinion," which are "the essential objects of science,"—we use the glowing words of Cuvier himself—*these* are, indeed, objects which, if they can only be fully effected by governments, can be promoted by men of science, and confer a true lustre upon all who seek them. Occupied with such grand objects, Cuvier passed his life in study and exertion, and he was still occupied in them when paralysis laid its iron hand upon him, leaving for a few days his noble mind untouched, and then without violence extinguishing his mortal life. With the same calmness with which he had been accustomed to reflect on the plan and decrees of Providence in the regulation of all nature, did he resign himself to the inevitable laws which regulate the duration of the immortal portion of man in a mortal frame.

It is when we pause, after dwelling on the close of the earthly existence of such a mind, that the solemn but consoling belief visits us, that such activity has not all ceased, that such manifestations of the soul cannot all die. We follow with our feeble imagination the spirit departed into some higher sphere, where it receives further amplifications of perception and reason, that it may behold yet more of the vast design which it was even here occupied in contemplating, in interpreting; and to find a confirmation of the elevated faith which here it cherished, that every thing was created for good.

Some feelings of sorrow we must be affected by, some natural tears we shed, to see all that is best and brightest in what we call life so transient, and but the dream of a shadow, or a vapour. We may wish that a few more years had been accorded to Cuvier. But we should rather recall what his life had already permitted him to accomplish. He had not reached the years enumerated by the psalmist, but his labours had been those of a century. Looking back to his vast achievements in the natural history of the earth and its creatures, wherein, if he began much, he had the rare happiness of living to bring almost every thing which he touched into order, if not to perfection; viewing his qualities of sagacity and enlarged benevolence in the high station of a minister of state, especially entrusted with the advancement of the national mind; remembering the eloquence with which, in his undying *Eloges*, he conferred popularity, immortality, on much individual intellect and virtue; and seeing with what unstained purity he walked in private life;—what is there that could be desired more for Cuvier? A reputation more exalted than that of conquerors; a fame more extended than that of princes; the power of doing good, actively employed; a continual reference of the works which he studied to the great Creator, whom in his lowliest works he acknowledged; a life of patient and well directed enquiry; these, although but human glories, may irradiate the soul when the body's life is gone. To him, as to every industrious student, death might seem to come in the midst of enquiries unfinished, and undertakings incomplete. To others, considering what he perfected, and what he was intending, it more justly seems as if he were removed when his capacious mind had performed its allotted office in this world, and was aspiring, not presumptuously, but with high and searching thought, to explain that unity, and greatness, and perfection of nature, of which, although he pointed to it, none can feel a perfect comprehension in this state of existence. His latent thoughts were those which we may conceive to be continued after death. He had caught glimpses, only revealed to such minds, of some great scheme, which it is just possible that, if life had been permitted to him, he might have been able to convey a faint apprehension of to others. There is something sublime in this participation of a mortal mind in the knowledge of higher powers, not, as in the infancy of the world, by vain, forbidden, and impious attempts of disastrous consequence; not as in the visions of mythology, for the purpose of deciding some idle question connected with physical enjoyments; but to raise and purify man's thoughts, and to teach him his true position and his duties.

To do justice to the scientific merits of Cuvier, each of his great works should have been subjected to analysis. The view of them all, comprehending, as they do, forty years of his life, suggests too many general reflections: yet even such a survey may induce some readers to turn to his works, which are, perhaps, less known in England than they deserve to be, and others, attracted by his great example, to make some efforts to imitate it.

From the London Literary Gazette.

The United States and Canada, in 1832, 1833, *and* 1834. By C. D. Arfwedson, Esq. 2 vols. 8vo. Bentley. 1834.

Notwithstanding that this is evidently an anti-Trollopian work, and intended to manifest the most conciliating spirit, it affords abundant proof that the accounts given by our fearless country-woman were not overcharged; and that, although America is progressing, it will be a long time before it can attain to the elegance of modes and manners of which it is desirous to have the reputation. Without much novelty in the information, there is much amusement afforded by the anecdotes scattered over these pages. The author is a Swede, and, therefore, we must not visit the faults of style very severely, although from Mr. Arfwedson's imperfect acquaintance with the English language, some very extraordinary sentences are occasionally to be found. We do not know how Brother Jonathan will feel inclined towards a work which, under the guise of friendship, contains so many severe animadversions upon the state of society in the greater portion of the United States. Had the author ventured upon such topics before Captain Hall and Mrs. Trollope had broken the dangerous ground, the anger, which has been directed towards them, would most assuredly have descended upon his devoted head; but, these adventurous travellers having cleared the way, the others, who follow in their wake, have nothing to do but to accuse them of misrepresentation, affect to be highly indignant at the falsehood of their assertions, and then proceed to corroborate their statements, and to add an immense number of far more astounding facts. In no part of Mrs. Trollope's work is there so revolting a description of the society in a steamboat; and Mr. Arfwedson imputes to the most sordid motives. a recklessness of human life throughout a large portion of the community, which is absolutely shocking. There are, however, a great many compliments by way of a set-off; and while some towns, and even states, are given up wholly to reprobation, others are proportionably lauded.

We shall make our extracts with the greatest impartiality, anxious, like Mr. Arfwedson, to do justice to what really merits praise; and to show to the Americans themselves the horror with which civilised people must regard those evils which have sprung from a too ardent pursuit of gain. We commence with a picture of the happy state of things arising out of the institution of temperance societies and savings' banks. Mr. Arfwedson visits the gun-factory, at Springfield, and is delighted with the conduct and appearance of the workmen:—

"One of these hospitable men went even as far as to insist on my going home to his house, although in the busiest part of the day, with a view, as he expressed himself, 'to see how neatly and comfortably they lived.' I accompanied him, accordingly, to a small but clean one-story frame house, the outside painted white, and the inside as neat as a *boudoir*. Two rooms and a kitchen formed the whole establishment; and, although small, was extremely pleasant. Every thing bore the stamp of being regulated by a steady and industrious mistress: and in this I was by no means deceived, for she was *in*deed an unexceptionable wife. The husband extolled her merits in a manner which reflected the greatest honour on him: she entered the room shortly afterwards, leading a boy and a girl by the hand, simply but neatly dressed, and bowing to the stranger; the whole ceremony was performed in a manner seldom witnessed in Europe by a woman in her situation in life. If domestic felicity exists on earth, it certainly might be traced to this unostentatious dwelling; both wife and husband cast a glance at each other and at their children, truly indicative of happiness.

My landlord, justly proud of his comfortable home, and anxious to show me every thing, from the garret to the cellar, now requested me to accompany him to the garden adjoining the house, also his property, and tastefully laid out by his own hands. 'This small enclosure,' said he, 'has been made by myself, the same year I married. All the flowers, vegetables, shrubberies, and fruit trees, that you see, have been planted and nursed by this hand.'

"The garden bore evident marks of having been greatly taken care of: the trees almost sunk under the weight of various fruits. I also discovered vines, of which more than ten were crowded with grapes. On returning to the house, I was not a little surprised—I may add, agreeably surprised—to find that the mistress had, during our temporary absence, prepared a cold collation, of which no landlady need have been ashamed. The table-cloth partook of the whiteness of snow: and, although the knives and forks could not lay claim to extraordinary beauty, yet the whole arrangement was so inviting, that it was truly delightful to sit down to the frugal and hospitable board."

Our next anecdote, though exceedingly amusing, is of a less interesting description.

"On returning from this excursion, I was overtaken by one of the most awful storms I ever witnessed. It came on so suddenly, that no person was prepared for it. A tolerably large proportion of hats took their departure in the first onset, and the owners ran foul of each other in quest of their property, carried away by the violence of the wind. But what particularly attracted my attention, was, that within five minutes the streets were filled with fragments of paper, sailing which ever way the eye turned, together with a variety of vegetables, pieces of linen, and other materials, entirely interrupting the view. I happened to mention this circumstance to one of the citizens of the place, and received the following remarkable answer: 'No nation on earth,' said he, 'uses a hat for so many purposes as a Yankee: it serves him at once for a head covering, a writing-desk, a larder, and a portmanteau. In it the merchant deposits patterns of various descriptions: the doctor uses it as an apothecary's shop: the married man, returning from market, converts it into a depository for potatoes and other vegetables: to the traveller it serves as a knapsack. Nothing has been more severely censured among enlightened people than the reform lately introduced in the shape of hats. By the present fashion, it is next to impossible to put more in its inside than a pocket-handkerchief, and a dozen of cigars. Should, unfortunately, the present form be still more curtailed, then there will be no enduring the caprice of fashion, and who knows but a dreadful revolution may be the consequence!'"

"That this picture is somewhat exaggerated, cannot well be denied, but entirely without foundation it certainly is not. A hat has unquestionably more offices to perform in these states than in any other country. To stuff it with newspapers, letters, and cigars, is of common occurrence. Can it then be wondered at if, when a sudden gust of wind dislodges it from the head, a shoal

of imprisoned objects should seek to take advantage of their liberty?"

Misery of a nocturnal visit to an American city :—

"It was midnight before we reached our place of destination. To find accommodation at such an unseasonable hour is a thing I have been taught by woful experience never to expect in America. Upon this occasion, I had to enjoy the benefit of a nocturnal drive through the streets of Philadelphia, from house to house, without a chance of success—alone, and unacquainted with the place—till daylight at length began to dawn upon me. An honest watchman (to the credit of the profession be it mentioned), at last took compassion on me, and indicated a house where I could at least, as he observed, get shelter for the night. But rest was out of the question. A creaking bed, a broken pane of glass, with a pair of inexpressibles filling the gap, and a confined atmosphere, formed the sum total of my comforts. Add to this, the size of the room, more suited for a dwarf than a full-grown person; and it is, after all, but an imperfect picture of my lonely lodging. By way of a substitute for a candle, a dismal lamp was handed to me, from which issued a smell so obnoxious to the spiders and rats, (co-occupants with me of this cage), that these little animals were actually taken ill with it, and kept in constant motion till the sun at length broke in upon them. To lie down in such a place, when exhausted by fatigue, is easily done; but the waking in the morning inspires reflections of a serious stamp. A glance at the scattered objects around is enough to banish the inmate. I lost no time, as may be supposed, in taking leave of my comfortless quarters, and removed to Head's Hotel, the best, without exception, in the United States."

WASHINGTON.

"It was on a rainy, disagreeable, and uncomfortable November day, that I arrived at Washington. The first object which struck me at a distance was the capitol, the wonder of America, where the members of congress assemble. The situation of this edifice is on an eminence at one end of the city, facing the president's house at the other extremity: both are connected by a long and wide avenue, a mile in length, the only regular and close built street in the city. The stage moved slowly and cautiously over an infinity of rubbish, stones, and deep holes, as the avenue was then undergoing repair. Few people were to be seen, and those consisted chiefly of slaves. Not a living being could I observe: there was none of the noise, confusion, and bustle, characteristic of a capital. Hardly a coach could be perceived: if one did appear, it was empty, or the driver was indulging in a comfortable nap on the box. In the streets, or rather roads, traversing the avenue which I entered, solitary houses were here and there observed, distant several hundred yards from each other. I could scarcely believe my eyes: I fancied myself in a village. Is this Washington, said I to myself, the capital of another hemisphere? My features must have expressed what passed inwardly, for an American, who happened to be in the same coach, asked me, half smiling, whether, with my European notions of a metropolis, I was not rather disappointed in my expectations? He concluded these enquiries by adding, in a serious tone: 'Simplicity is the motto of a republic. What you see is a true illustration of it. What can be more grand than that a country, so extensive as the continent of North America, should not require a larger spot than this for a capital?' I made no answer to this remark, just recollecting one of Washington Irving's expressions—'Washington, this immense metropolis, which makes so glorious an appearance on paper.'"

Delectabilities of travelling in the southern states:—

"On arriving at Fredericksburg, I lost no time in taking advantage of the stage on the point of starting for Richmond. Here I was soon reminded of another circumstance, namely, my entrance into the southern states, by the execrable condition of the public roads. The traveller has to choose between two alternatives—to be shaken to pieces, or be engulphed in deep mud-holes. The roads are made of trees laid crosswise, emphatically called corduroy roads. It would, in many places, be quite impossible to effect a passage, if this precaution were not adopted, the soil being so soft, that the least rain is sufficient to make them impassable: the clay is often three feet deep, the wheels stick fast in it, and the carriage is consequently upset.

"If the timber, thus laid across the roads, had been cut, and so placed as to fit, it would answer the purpose of a well-constructed bridge; but, in so young a country as America, this cannot be expected. The trees are laid on the ground in their rough state, with the branches only cut off: in a thousand places the inhabitants had not even given themselves time, or perhaps voluntarily neglected, to take off the small boughs, so that it not unfrequently happened that, owing to these leafy branches becoming entangled with the wheels, the trees on the road were displaced. The question then naturally arose, which was the stronger—the wheel or the branches: but never did the driver attempt to check the speed of the horses, from apprehension that the coach would go to pieces. This idea seldom enters the mind of an American coachman; nevertheless, there is no country on earth where this precaution would be more advisable than in the southern parts of the United States, still so thinly peopled, that you may travel miles and miles through forests, without discovering a human habitation where assistance could be procured in case of necessity.

"The cause of this indifference to horses and coaches is, that all stages carry mail-bags, which, according to contract with the post-office department, must arrive at their destination at a given time, otherwise the contractor is liable to a considerable fine. To evade this result, he gives the drivers strong injunctions to make all possible haste, let the consequence be what it may; they therefore proceed with the utmost celerity, regardless of the danger of breaking down coaches or killing horses. The consequence is, that accidents too often occur; and, on such occasions, if a carriage or team cannot be found in the neighbourhood, the driver takes the mail-bags, throws them upon a cart, and thus continues his journey, leaving the unfortunate passengers in the middle of the road, in a bog, or in a forest, many miles from any habitation."

We have not yet reached the end of the first volume of this work; but we must pause,

---

A Description of the Azores, or Western Islands. By Captain Boid, late of H. M. F. Majesty's Navy. 8vo. Churton. 1835.

Neither poetry nor romance can add to the beautiful features with which nature has embellished this lovely cluster of enchanted islands, "where all, save the spirit of man, is divine;" and we are happy to see the public attention attracted, through the medium of this well-written volume, to a scene in which the social system calls so loudly for improvement. The present state of Portuguese politics is peculiarly auspicious to the advance of reform, and, perhaps, in

no part of the youthful queen's dominions is it so loudly called for as in these misgoverned islands, where religion has degenerated into bigotry, and the progress of industry and of civilisation has been checked by the prejudices and the imbecility of the government. Captain Boid, more anxious to portray the actual state of society in the Azores, and the evils resulting from the narrow policy hitherto pursued, than to display a passion for the picturesque, does not deal very largely in descriptions of the scenery of these beautiful islands. The omission is, however, supplied by several lithographic sketches, from the pencil of Admiral Sartorious; and, by the following extract, it will be seen that the author was not indifferent to the charms of the landscape:—

"We trotted off towards the heights that surround the Val das sete Cidades, which we soon reached, being only between two or three miles distant—though in parts up a steep acclivity. On attaining the summit, a little more than 2000 feet above the level of the sea, we enjoyed at once the comprehensive view of the whole tract constituting the celebrated valley, besides an exterior prospect, similar to that described from the summit of Maffra. The valley is a basin surrounded by mountains nearly fifteen miles in circumference, and forming the lips of a stupendous crater, whose interior sides are composed of pumice, and slope down at an angle of 45 degrees to the bottom—where is formed a rich valley nine miles in circumference, with (in the centre) two beautiful unruffled lakes, occupying one third of the whole superficies, and separated only by a narrow isthmus; the one is called Lagoa grande, the other Lagoa azul—close to which, and delightfully situated on the borders, are the few white cottages called the Seven Cities. The reader will naturally ask the origin of this appellation. I know not; no one in the island knew, nor is it any where recorded.

"The interior sides of this crater are deeply furrowed by rocky ravines, from the summit to the lakes, many of them presenting picturesque cascades and most romantic scenery. The higher portions of the slopes are covered with luxuriant ferns and underwood, together with patches of wild myrtle, box, arbutus, and other evergreens—below which the descent is clothed with groves of orange and lemon trees; and at the bottom, round the borders of the lakes, lies a cultivated plain that produces the most fertile crops of grain, pulse and grapes, with excellent hemp and flax."

From the London Athenæum.

LIFE.

BY THE LATE REV. C. C. COLTON.

[The following poem has been kindly transmitted to us by a gentleman to whom the writer was well known. "Circumstances," he observes, "add much to its interest;—having been written but a short time previous to his death, and while labouring under that strong excitement of mind occasioned by the decision of his medical advisers that he must undergo an operation; rather than submit to which, it is generally believed that he committed suicide."]

How long shall man's imprisoned spirit groan
'Twixt doubt of heaven and deep disgust of earth?
Where all worth knowing never can be known,
And all that can be known, alas! is nothing worth.

Untaught by saint, by cynic, or by sage,
And all the spoils of time that load their shelves,
We do not quit, but change our joys in age—
Joys framed to stifle thought, and lead us from ourselves.

The drug, the cord, the steel, the flood, the flame,
Turmoil of action, tedium of rest,
And lust of change, though for the worst, proclaim
How dull life's banquet is—how ill at ease the guest.

Known were the bill of fare before we taste,
Who would not spurn the banquet and the board—
Prefer th' eternal, but oblivious fast,
To life's frail-fretted thread, and death's suspended sword?

He that the topmost stone of Babel plann'd,
And he that braved the crater's boiling bed—
Did these a clearer, closer view command
Of heaven or hell, we ask, than the blind herd they led?

Or he that in Valdarno did prolong
The Night, her rich star-studded page to read—
Could he point out, 'midst all that brilliant throng,
His fixed and final home, from fleshy thraldom freed!

Minds that have scann'd Creation's vast domain,
And secrets solved, till then to sages seal'd,
Whilst Nature own'd their intellectual reign
Extinct, have *nothing* known or nothing have revealed.

Devouring grave! we might the less deplore
Th' extinguish'd lights that in thy darkness dwell,
Wouldst thou, from that last zodiac, *one* restore,
That might th' enigma solve, and doubt, man's tyrant, quell.

To live in darkness—in despair to die—
Is this indeed the boon to mortals given?
Is there no port—no rock of refuge nigh?
There is—to those who fix their anchor-hope in heaven.

Turn then, O man! and cast all else aside:
Direct thy wandering thoughts to things above—
Low at the cross bow down—*in that* confide,
Till doubt be lost in faith, and bliss secured in love.

From the Durham Advertiser.

THE DEEPEST MINE IN GREAT BRITAIN.

The shaft at present sinking at Monkwearmouth Colliery, near Sunderland, has attained a considerably greater depth than any mine in Great Britain (or, estimating its depth from the level of the sea, than any mine in the world). Pearce's shaft, at the consolidated mines in Cornwall, was, till lately, the deepest in the island—being about 1470 feet in perpendicular depth, of which 1150 feet are below the surface of the sea. The bottom of Woolf's shaft (also at the consolidated mines) is 1230 feet below the sea; but its total depth is less than that of Pearce's shaft. The bottom of the Monkwearmouth shaft is already upwards of 1500 feet below high water mark, and 1600 feet below the surface of the ground. It was commenced in May, 1826. The upper part of the shaft passes through the lower magnesian limestone strata, which overlap the south-eastern district of the geat Newcastle Coal-field, and which, including a stratum of "freestone sand" at the bottom of the limestone, extended, at Monkwearmouth, to the thickness of 330 feet, and discharged towards the bottom of the strata the prodigious

quantity of 3000 gallons of water per minute,—for the raising of which into an off-take drift, a double-acting steam-engine, working with a power of from 180 to 200 horses, was found necessary. The first unequivocal stratum of the coal formation, viz: a bed of coal one and a half inches thick, was not reached till August, 1831, (being about 344 feet below the surface,) after which the tremendous influx of water which had so long impeded the sinking operations, was "stopped back" by cylindrical "metal tubbing" or casing, fitted (in a series of small portions) to the shaft, and extending from below the above bed of coal to within 26 yards of the surface. The sinking now proceeded with spirit—still no valuable bed of coal was reached, although the shaft had passed considerably above 600 feet into the coal measures, and much deeper than had hitherto been found requisite for reaching some of the known seams. It became evident that the miners were in unknown ground. A new "feeder of water" was encountered, at the great depth of 1000 feet, requiring fresh pumps and a fresh outlay of money. The prospects of the owners became unpromising in the eyes of most men, and were denounced as hopeless by many of the coal-viewers! still the Messrs. Pemberton (the enterprising owners of this colliery) continued, and, in October last, reached a seam of considerable value and thickness, at the depth of 1578 feet below the surface; and presuming that this newly discovered seam was identified with the Bensham seam of the Tyne, (or Maudlin seam of the Wear,) they are rapidly deepening their shaft, in anticipation of reaching the Hutton, or most valuable seam, at no distant period, but which, (if their anticipations are well founded,) will be found at a depth approaching 300 fathoms from the surface! In the mean time, however, workings have very recently commenced in the supposed Bensham seam. A party of scientific gentlemen descended into these workings on Saturday last, and, aided by every facility and assistance which could be afforded to them by the Messrs. Pemberton, made several barometric and thermometric observations, the detail of which will be *deeply* interesting to many of our readers. A barometer at the top of the shaft (87 feet above high water mark) stood at 30.518, its attached thermometer (Fahrenheit) being 53. On being carried down to the new workings (1584 feet below the top) it stood at 32.280, and, *in all probability higher than ever before seen by human eye!* the attached thermometer being 58. Four workings or drifts had been commenced in the coal; the longest of them being that "to the dip," 22 yards in length and nearly 2 in breadth—to the end of which the current of fresh air for ventilating the mine was diverted—(and from which the pitmen employed in its excavation had just departed,) was selected for the following thermometric observations. (Temperature of the current of air near the entrance of the drift, 62 Fahrenheit; near the end of the drift, 63; close to the face or extremity of the drift, and beyond the current of air, 68.) A piece of coal was hewn from the face; and two thermometers placed in the spot just before occupied by the coal (their bulbs being instantly covered with coal dust) rose to 71. A small pool of water was standing at the end of the drift. Temperature of this water at 11 o'clock, 70; 3 hours later 69½. A register thermometer was buried 18 inches deep below the floor, and about 10 yards from the entrance of the drift; 40 minutes afterwards its maximum temperature was 67. Another register thermometer was similarly buried near the end of the drift; and after a similar period indicated a maximum temperature of 70. It was then placed in a deeper hole and covered with small coal;—some water oozed out of the side of this hole to the depth of 6 or 8 inches above the thermometer, which, upon being examined after a sufficient interval of time, indicated a temperature of 71½. A stream of gas bubbles (igniting with the flame of a candle) issued through the water collected in this hole; the bulbs of two very sensible thermometers were immersed under water in this stream of gas, and indicated a temperature constantly varying between 71.5 and 72.6. A thermometer was lowered to the bottom of a hole drilled to the depth of 2½ feet into the floor of another of the workings, and the atmospheric air excluded from it by a tight stopping of clay; this thermometer being raised after the lapse of 48 hours, stood at 71.2. Other experiments, in the prosecution of these enquiries, are contemplated.

EUGENE BEAUHARNAIS.

The father of the young sovereign matrimonial of Portugal, Prince Eugene de Beauharnais, was descended from a noble family in the province of Berry; he was Viceroy of Italy, Prince of Venice, and Hereditary Grand Duke of Frankfort, and married the Princess Auguste, daughter of Maximilian Joseph, King of Bavaria. By the 8th article of the Treaty of Paris, in 1814, Prince Eugene, as Viceroy of Italy, was promised a suitable establishment out of France; which was confirmed by the treaty between Austria and Bavaria, 23d April, 1815, signed by the plenipotentiaries of Russia and Prussia, with the consent of England. The King of Bavaria assigned him for residence the chateau of Bayreuth, with all its appurtenances. In May, 1816, Prince Eugene concluded with the pope a treaty, by which he purchased fiefs in the Roman state for 150,000 scudi. In 1817, he was created Duc de Leuchtenberg and Prince d'Eichstadt, with the title of Royal Highness. The ducal house of Leuchtenberg is the first principality of Bavaria, and the family ranks immediately after the princes and the princesses. The Leuchtenbergs possess, under the sovereignty of Bavaria, a principality of 24,000 inhabitants, and a revenue of 110,000 florins. The late Prince Eugene also purchased the territory of Eichstadal and several forests, fisheries, mines, and estates, at Allersdorf. He died 21st February, 1834, at Munich.

His highness Duke Augustus is colonel commandant of the 6th regiment of the Bavarian Cavalry; and his only brother, Prince Maximilian, is a subaltern in the 4th regiment of cavalry in the same service. His highness's aunt is Hortense Duchess de St. Leu, wife of Louis Bonaparte.

Critical Notices.

Allan Cunningham's edition of the *Works of Burns* is now completed, by the publication of the eighth volume. It contains Burns's remarks on Scotish song; the memoranda of three tours, made at the time for the purpose of being expanded into a complete narrative; and some fragments from the poet's commonplace-book, including the rough materials from which he composed the journal, unfortunately lost to the world, through the perfidy of a rascal-acquaintance of the bard's, who stole it. A very copious glossary (with illustrative quotations from Scotish authors), an index, and a selection from the poetical tributes to the memory of Burns, are appended. Among the tributes, the latest, and the most spontaneous in feeling and characteristic in style, is Allan's own, in which he takes leave of his pleasant task. The artist, D. O. Hill, has continued improving with every volume. The vignettes of Ayr and the Pier of Leith are more successfully emulative of Stanfield than some former views were of Turner. They are very clever works of art, and beautifully engraved. We subjoin the editor's leave-taking, entire.

My task is ended—farewcel, Robin!
My prentice muse stands sad and sobbin',
To think thy country kept thee scrubbin'
Her barmy barrels,
Of strains immortal mankind robbin',
And thee of laurels.

Let learning's Greekish grubs cry humph!
Hot zealots groan, cold critics grumph!
And ilka starr'd and garter'd sumph
Yawn, hum and ha;
In glory's pack thou art a trumph,
And sweeps them a'.

Round thee flock'd scholars mony a cluster,
And dominies came in a fluster,
In words three span lang 'gan they bluster
Of classic models,
Of Tully's light and Virgil's lustre,
And shook their noddles.

Ye laugh'd, and muttering, "Learning! d—n her!"
Stood bauldly up, but start or stammer
Wi' Nature's fire for lore and grammar,
And classic rules,
Crush'd them as Thor's triumphant hammer
Smash'd paddock-stools.

And thou wert right and they were wrang—
The sculptor's toil, the poet's sang,
In Greece and Rome frae nature sprang,
And bauld and free,
In sentiment and language strang,
They spake like thee.

Thy muse came like a giggling taupie,
Dancing her lane: her sangs sae sappy,
Cheer'd men like drink's inspiring drappie,
Then, grave and stern,
High moral truths sublime and happy
She made them learn.

Auld gray-beard Lear, wi' college lantern,
O'er rules of Horace stoitering, venturin'
At song glides to oblivion saunterin'
And starless night;
Whilst thou, up cleft Parnassus canterin',
Lives on in light.

In light thou livest. While birds lo'e simmer,
Wild bees the blossom, buds the timmer,
And man lo'es woman—rosie limmer!
I'll prophecie
Thy glorious halo nought the dimmer
Will ever be.

For me, though both sprung from ae mother,
I'm but a weakly young half-brother,
Sae, O forgive my musing swither,
Mid toils benighted,
'Twas lang a wish that nought could smother
To see thee righted.

Frae Kyle, wi' music in her bowers,
Frae faery glens, where wild Doon pours,
Frae hills, bedropp'd wi' sunny showers,
On Solway strand,
I've gather'd, Burns, thy scatter'd flowers
Wi' filial hand.

And O, bright and immortal spirit!
If ought that lessens thy rare merit
I 've utter'd, like a god thou'lt bear it:
Thou canst but know
Thy stature few or none can peer it
Now born below.

"*Oriental Memoirs*, by James Forbes, Esq., 2nd edit. revised by his daughter the Countess de Montalembert. 2 vols. 8vo.'—It is assigned as an apology for the republication of these rather antiquated Memoirs, that India has not changed since their first appearance; but, fortunately, our knowledge of India has been more progressive, and topics on which the author has only given imperfect hints, have been since fully investigated and explained. The Hindú and Mahomedan creeds, of which Mr. Forbes had only some vague general notions, have, within the last few years, been thoroughly examined by persons who had more leisure and better opportunities for enquiry; and no one would now dream of consulting the rambling accounts of an unscientific observer for information respecting the Natural History of Hindústan. It is said, however, that the author has described certain customs of the East, which elucidate passages of Scripture that were previously open to infidel objections. On this subject the present editor does not seem to be the best of judges, for, in the biographical memoir prefixed to the first volume, we read, "He had more of that Christian charity recommended by St. Peter, which suffereth long, and is kind," &c. This is robbing Paul to pay Peter, for the passage alluded to occurs in the epistle to the Corinthians. There are, no doubt, customs described in these volumes which will recall to the memory similar customs mentioned in the Bible; but any thing like elucidation of difficulties, or refutation of infidel objections, we have been unable to discover. The best that can be said of these volumes, is, that they are written in a light gossiping style, and that they bear the marks of a miable temper and kindly feeling; those who wish to obtain a general notion of India may consult the work with advantage: those who seek accurate information must go elsewhere.

—

"*Tales of Woman's Trials*, by Mrs. S. C. Hall."—There are few writers who keep their places on the pages of our annuals more gracefully or pleasantly than Mrs. Hall—there is always a freshness, and oftentimes an invention, displayed in her stories, which more parsimonious contrivers of fiction would spin out into the mystic three volumes. Having acknowledged this, we must add our conviction that her short tales read better singly than in conjunction with each other, and that we doubt the policy of thus collecting them into a volume. Many, too, have appeared before, and this, we think, should have been stated. "Grace Huntley" is the best of the series, though there are power and feeling in all of them, and an earnest and affectionate pleading of the cause of womankind, against the heartlessness and oppression of the stronger

sex, which is much more to our taste than the vigorous (and sometimes rather noisy) assertion of their rights, to which some lady-champions have treated us. There is also sound religious feeling manifest throughout the volume, and it will be (what we imagine it was intended to be) a welcome present to the young.

—

Gell's Topography of Rome and its Vicinity.

These elegant volumes are indispensable to the complete scholar and the classical traveller. No one can thoroughly study the history of the earlier ages of Rome, or understand the more familiar allusions of her writers, without possessing this work. The happier classic who is able to follow out his studies upon the spot, cannot prudently or even cheaply do without it: it will serve at once as a guide and an instructor, telling him whither and by what direction to pursue his researches, and indirectly teaching him the means by which he may engraft the antiquary upon the scholar, and confirm, correct, or get beyond his teacher.

Taking Rome as his central point, Sir William Gell has extended his surveys in all directions, noticing every celebrated spot, whether primitive, classical, modern, or compounds of each and all, and taking them in alphabetical order. The work is not, and indeed from its nature could not have been, a hasty production. Years of labours of love have been devoted to the unconscious accumulation of materials; the previous publications of the author had rendered him skilful in the immediate practice of classical antiquarianism; the study of a whole life had imbued him with the requisite knowledge and feeling for the task. When the composition was finally determined on, he made, in addition to personal examinations, a trigonometrical survey of the district, applying modern science to bear upon ancient remains. The result of this particular labour accompanies the volume in the shape of the completest map of "Rome and its Environs" we ever saw, or which indeed can ever have been published.

We have spoken of the work as addressed to the scholar; and so of course it is; but there is nothing dry in its execution to frighten the general reader, nor is its interest altogether limited to one class. The thorough knowledge of the author renders his ideas distinct, whether they be true or whether they be doubtful. His acquaintance with the present aspect of things enables him to throw the life of existing nature into his descriptions. His style is easy, clear, and academic: and his mode of treating the subjects is learnedly gossip-like. Various associations are also called up in turning over its leaves. Many ages seem dimly to pass in review before us. We catch some obscure glimpses of the lost nations which flourished before the period of authentic history. We see Rome in her early struggles, and are taken over the very fields on which (pinning our faith to Sir William) they took place. She is again presented to us in her high and palmy state; melancholy memorials of her decline constantly come up before us; monuments of the insecurity, anarchy, and romance of the middle ages, are frequently seen; but her present degradation and decay is the constant and all-pervading feeling.

The *Topography*, it may be supposed, is not well adapted for quotation; nor will isolated passages convey any other notion of the work than its form.

There is an appendix on the History and Language of Ancient Italy. One object of the paper on Language is to show, that the Umbrian or Etruscan tongue—the root of the Latin—was in its origin a mixture of Gaulish and of the ancient barbarous Greek spoken by the Italian Pelasgi; some of the words being Gaulish or Celtic; others, with the structure and characters of the language, being old Greek. Another and a more useful object, is to prove the barbarous state in which the Latin language continued until a late period of the republic; when a constant communication with Greece took place, after which the Roman tongue rapidly advanced to its perfect condition. The philologist may not, perhaps, yield implicit confidence to all that Sir William advances; but he will find the paper learned, curious, and valuable. The essay on the History of Ancient Italy is intended to prove the truth of the Pelasgian migrations into that country. The subject matter, it may be said, consists of darkness visible; and it would be difficult to prove satisfactorily the various premises which the learned author uses so freely, and with such mastery, to establish his case. Upon this paper, and upon several articles in the Topography itself, the general reader and the less enthusiastic scholar will be driven to wonder, that circumstances and persons whose existence he has always dreamed were fabulous, doubtful, or at best obscure, should be quoted and used in argument as undeniable facts. After his examination of Sir William Gell's labours is finished, he may also say to himself—"Behold the last of the Anglo-Romans: the product of another age, more learned, more laborious, more accomplished, but less *useful* than ours. The magnitude and number of *our* revolutions and migrations—the weight of the 'os alienum per omnis terras ingens'—and the pressure of population, on which, less lucky than the ancient Pelasgi, we have no oracle to direct us, have diverted our thoughts from the past to the present—from speculation to practice."

—

Sketches of Corfu, Foreign and Domestic, is a little work which aims at giving the interest of life to descriptions of manners, and scenery, by interweaving with them allusions to the personal feelings of the pilgrim-narrator, and the traditions, legends, and historiettes connected with the island. The idea is not bad, and the scene well adapted to the idea. Corfu is little known; its scenery is romantic; its clime, beauty itself; the manners of the people, Greek, with a Venitian cross; within the memory of living man, they have had a variety of rulers, and it is now a colony or dependency of Great Britain. In the execution, the utmost is not made of the advantages of the subject, although an agreeable volume is produced. The descriptions of scenery are picture-like; the tales pretty and interesting, though without much of historical *vraisemblance*; and the sketches of manners lively and amusing, but with an air of being coloured for effect. The introduction of the fair author's personal character rather injures than improves the work. She wishes to appear as a sort of respectable female "Childe," who has gone to Corfu without any conceivable object unless to talk of being separated from all objects of "affection." But the dramatic part is, luckily, not sustained: saving in this affectation, there is neither gloom nor misanthropy in the book.

—

The translation of Dr. Bechstein's *Cage Birds* is a very delightful book of its kind. The author was a German physician, who gave his leisure hours to bird-fancying, and in time made his relaxation a study. As he appears to have been eminent in relation to his hobby, he was solicited to write a treatise on the subject, and, many years ago, complied with the "request of friends." The task was fulfilled in such a manner as might have been expected from a scientific enthusiast; the method is clear and orderly; the manner earnest; the style pleasant, from its German simplicity. The author first takes a general view of "Housebirds," in their songs (where they have any), their habitations, food, breeding, disorders, the probable duration of their lives, and the best mode of catching them. He then arranges his subjects in classes, and describes each

species in detail, the descriptions embracing all the foregoing heads. How the translation of the honest doctor came to be delayed so long, we know not. The task has been ably done: the spirit of the original being infused into the English; corrective, qualifying, or illustrative notes added; and some information on several species which have been recently kept with success in this country, introduced into the work: it seems to us an indispensable book for the bird-fancier.

—

The *Tough Yarns* of an OLD SAILOR are not spun out to a wearisome length. To carry out his simile, they are strands of seasoned cables, and as good "marine stores" as any that have found their way through the press for some time. We have a variety of such stories as are told round the galley-fire, or on a sunny bench in Greenwich Hospital; in which Jack's homely readings of the vernacular tongue are preserved as well as the sea slang. In the fictitious and abundant use of nautical phraseology, and the force and vividness of the similes, consists mainly the humour of the writing: the puns are bad, as well as unseasonable. The OLD SAILOR paints sea-scenes and adventures with vigour and gusto; now and then reminding us of Tom Cringle, and with a strong sense of the comical that approaches Smollett.

George Cruikshank has caught the spirit of the author, in his illustrative etchings. The look and action of the two sailors espying a land crab crawling off with the head of their deceased comrade—the way in which the sailor runs off and the Spanish customhouse-officer after him—the sneaking alacrity of movement and furtive looks of the three French dragoons that the fat and jolly old sailor is bearing down upon with a brace of pistols as his "bow-chasers"—the wonder and delight of the ugly Irishman when his captain's wife hugs and kisses him before her husband and the officers and crew—and the consternation and chagrin of the Neopolitan count whom Admiral Trowbridge is kicking out of his cabin—are capitally expressed. The group of pensioners in the frontispiece, too, is full of character.

The well-known circumstance of Nelson's sacrifice of Prince Caraccioli, at the instance of Lady Hamilton—one of the few spots on his character—is effectively told; and the murder of a tyrannical and cruel captain and his officers by the crew, is painted with sanguine colours. But perhaps the best bit of description, and one which will convey a favourable yet fair notion of the merit of the volume, is this of

A CUTTING OUT.

"At two bells, instead of calling the watch, the hands were turned up, and all ordered aft on to the quarterdeck; where the captain was standing as upright as a fathom of smoke in a calm, and the master was bent down like a yard of pump-water measured from the spout, and looking over a chart of the harbour, as busy as the devil in a gale of wind.

"Well, every soul fore and aft mustered in the twinkling of a handspike, and they all crowded together as if they'd been stowed with a jack-screw for a long voyage; and then the captain up and tells 'em that he meant to head the boats himself, and cut the Harmoine out, if they would do their duty like men and back him. My eyes, if there warn't a cheer then, there never was one before nor since; and the lads, to seal the bargain, gived one another a grip of the fist that would have squeezed a lemon as dry as a biscuit.

"So, you see, the murder was out, and every man betwixt the cabin-windows and the figure-head volunteered to the duty: but the captain said he wouldn't take more than one hundred, including officers and marines; he was sorry to leave any behind, as he believed them to be all brave fellows, but some must stay to work the ship, and, if necessary, bring her into action.

"Well, the men were picked out, the muskets, pistols, tommyhawks, and cutlashes got ready, and long hook-ropes coiled away, in the starn-sheets of each boat, and clinched to the ring in the bottom; the oars and rullocks were muffled and well greased, so that a sound might not be heard louder than the sigh of a periwinkle.

"The sun set soon after six o'clock; and as soon as twilight came on—which in them latitudes, when the sun is on the equator, and it was very near it then, comes on in a few minutes—the ship was hove in stays and stood in-shore, with a pleasant breeze and a stern swell setting after her. About eight o'clock, the wind died away, the yards were laid square, and the boats hoisted out, whilst those on the quarters were lowered, and all were soon manned for the expedition and shoved off. Whilst they're pulling in shore, messmates, I'll just lucydate Captain Hamilton's plan of attack.

"Now, mind me, this here paper of 'bacca shall be one battery, and this here 'bacca-box shall be the other battery, and this here shut-knife shall be the Harmoine—the laniard sarving for one cable out of the hawse-hole, and this piece of marline for the other cable out of the gun-room port; [he arranged the articles on the table.] Now the boats were to pull in, and the boarding parties had each a different place to board at. As soon as they got upon deck, the boats with their respective crews were to cut the cables and then go a head to tow; whilst four of the boarders were instantly to shine aloft to loose the foretop-sail and two to loose the mizentop-sail; which, if possible, were to be sheeted home to catch the breeze coming off the land. The Surprise was to come in close to the harbour's mouth, to act as circumstances required.

"The boats kept close together, but didn't make any quick head-way, as the captain meant to get in about midnight; when he expected the Spaniards would have their eyes buttoned up, and their ears plugged with their nightcaps, like the hawse-holes in blue water.

"Well, d'ye see, it was just about eight bells when the mast-heads of the Harmoine showed above the land, and the light rigging looked like a fine spider's web traced on the silvery sky; and there too fluttered the yellow rag, that was soon to be humbled under the saucy pennant of St. George. On pulled the boats, and except the ripple of the oars and the hissing of the foam in their wakes, silence slept deep and still, disturbed only by the moan of the sea as it broke upon the rocky shore.

"Suddenly there was a flash; and before the report could be heard, grapeshot were jumping about the boats and splashing up the water like a shoal of flying-fish at play. This firing was from a couple of guard-boats, each mounting a twelve-pounder; and if it did no other mischief, it aroused Jack Spaniard, who it appears was up and rigged like a sentry-box; and before a cat could lick her ear, flames of fire seemed to be bursting from the dark rocks, like lightning from a black thundercloud: it was the frigate, speaking with her maindeck and fokstle guns.

"Finding that the enemy was prepared, the captain had less delicacy in alarming them out of their sleep, and so the boats' crews gave three tremendous cheers. Mayhap your honour never heard the cheers on going into action, when the voice of man goes from heart to heart and stirs up all that is brave and noble in the human breast; it invigorates and strengthens every timber in a fellow's frame, and is to the weak or mild what mother's milk is to the infant.

"Well, they gave three British cheers as would have stirred up the blood of an anchor-stock, if it had any; and on they dashed, stretching to their oars with a good-will, and making the water brilliant with their tracks as they pulled for the devoted frigate, then almost three-quarters of a mile distant, which kept sending forth the red flames from the muzzle of her guns as the boats gallantly approached.

"Captain Hamilton boarded on the starboard-bow, and

with the gunner and eight or ten men cleared the fokstle. The doctor boarded on the larboard-bow, and with his party joined the captain; and the other boats having discharged their men, the whole of the boarders attacked the quarterdeck, where the Spanish officers had collected, and fought with desperation. And now mind the downright impudence of the thing; for whilst they were fighting for possession on deck, the sails were loosed aloft, the cables were cut, and the boats were towing the ship out of the harbour; and the craft, as if she warn't honestly come by, was walking off from the land like seven bells half-struck: if that warn't going the rig, then blow me if I know what is.

"When the Spaniards saw that the ship was actually under weigh, with sail on her, and the boarding parties cutting down all afore 'em, a great number jumped overboard and some ran below whilst the killed and wounded lay in all directions. About this time, Captain Hamilton received such a tremendous crack on the head from the but-end of a musket, as brought a general illumination into his eyes and stretched him senseless on the deck. A Spaniard, who had fallen near him, raised his dagger to stab him to the heart; but the tide of existence was ebbing like a torrent, his brain was giddy, his aim faltered, and the point descended in the captain's right thigh. Dragging away the blade with the last convulsive energy of a death-struggle, he lacerated the wound. Again the reeking steel was upheld, and the Spaniard placed his left hand near the captain's heart to mark his aim more sure: again the dizziness of dissolution spread over his sight, down came the dagger into the captain's left thigh, and the Spaniard was a corpse.

"The upper deck was cleared, and the boarders rushed below on the maindeck to complete their conquest. Here the slaughter was dreadful, till the Spaniards called out for quarter, and the carnage ceased: but no sooner was the firing on board at an end, when the sodgers at the batteries—who had been wondering at the frigate moving away as if by magic, and had been calling a whole reg'ment of saints to help 'em—let fly from nearly two hundred pieces of cannon, as if they were saying their prayers and wanted the British tars to count the beads. Howsomever, the wind was very light close in-shore, and the smoke mantled thick and heavy on the waters, so as to mask the ship from view, but a chance twenty-four-pounder hulled her below the water-mark. and they were obliged to rig the pumps. The mainmast, too, at one time was in danger from the stay and springstay being shot away, and the head-swell tumbling in made the frigate roll heavily; but about two in the morning they got out of gun-shot, the towing-boats were called alongside, and ever thing made snug. Thus in an hour and three-quarters the frigate was boarded, carried, and clear from the batteries.

Notabilia.

A Relic.—At Bavai, near Valenciennes, by the side of the road to Avesnes, one of the seven old Roman roads that concentrated at Bavai, a very fine cinerary urn in bronze, between nine and ten inches in height, including the cover, and eight inches in diameter, was discovered lately. It contained some small bones nearly reduced to dust, and has the following inscription: *Dis M. Hertius, C. Anno VIICX.* It is in fine preservation, and ornamented with bas-reliefs, in the purest style, and of superior workmanship. It probably was made to contain the ashes of one of the companions of Tiberius, who died at Bavai during the residence of that emperor there.

Joseph Bonaparte.—The muleteers both of Spain and Portugal have a custom of shearing the hair quite close on the back and sides of their beasts, in order to prevent the pack-saddle galling them; the rump is usually ornamented by this means, with flowers and other devices. On one in Spain, I saw the following ludicrous caricature:—"The Devil welcoming *Señor Don Josef Napoleon* to his infernal mansion;" underneath was carved, "*Entra Señor D. Josef, siempre al servicio de usted* (Enter Signor Don Joseph, I am ever at your service,") —a common phrase in the country.—From Col. Eliot's *Defence of Portugal.*

Statue of Charles XII.—A bronze statue of Charles XII., at the moment when he is struck by the bullet which closed his career, has recently been placed in the Royal Library at Stockholm.

Musical Festival.—The expenses of the late Royal Musical Festival in Westminster Abbey, were 12,933*l.* 14*s.* 9*d.*, and the receipts 22,013*l.* 18*s.*, the surplus has been equally divided between the Royal Society of Musicians, the New Choral and Musical Funds, and the Royal Academy of Music. The greatest number present was 3,800, which was at the third rehearsal.

Cardinal Zurla.—A late number of the *Diario di Roma* announces the death of Cardinal Zurla. His reverence was one of the most distinguished geographers of Europe, and his edition of the voyages of Marco Paulo, with annotations, is well known and justly esteemed. He was a member of numerous academics and learned institutions of Europe. Cardinal Zurla was the intimate friend of Pope Gregory, and was himself several times nominated as a candidate for the papal chair. He died on the 29th of October, whilst pursuing a scientific journey in Sicily.

Diamond.—Galignani's Paris paper contains an account of a fine diamond found by a poor man in a piece of wood from the Levant, and which is valued at 500,000 francs, and would be worth much more if it had not a slight tinge of yellow. It had, it is supposed, been concealed in the tree when young.

Parliamentary Debates.—We find that it is intended in the new house of commons to construct a gallery immediately behind and above the speaker's chair, exclusively for the parliamentary reporters, with easy means of egress and regress, and every other accommodation that may be deemed desirable. This is as it should be. We could perfectly understand, although we did not concur in them, the objections which some persons formerly entertained to the practice of publishing reports of the debates in parliament; but when those objections were abandoned, and when the publication was, we may justly say, sanctioned by the tacit acquiescence of both houses, we never could understand why every possible facility was not afforded for the correct execution of a task which must be sufficiently difficult and laborious, even under the most favourable circumstances.

Anecdote of an Irish Nurse.—The affection of Irish nurses to their foster-children is one of the most powerful and devoted feelings of which human nature is capable; they will follow and serve them through evil report and good report—in poverty and in prosperity—in foreign lands, as well as in their own country; and one instance I well remember, of a poor nurse, who, when she heard a foster child—the younger son of a family that had been both respectable and respected in former times—was in an English jail, came over, attended him during his sad and lonely hours of imprisonment; and when he was doomed to an ignominious death, never left his side until he exchanged time for eternity. She talked to him of those he had loved, before his soul and his name became polluted by evil. And it was a holy thing, within the prison walls, to hear that gray-headed woman put up her heart-felt prayers to the Almighty, for the object of such pure affection. When all was over, she claimed his body, —waked it after the fashion of her country; sold all she possessed in the world to give it decent burial; and was herself his monument; for, a few nights afterwards, she was found dead upon his grave!

Discovery of the celebrated work of Abelard, "SIC ET NON," *for which he was condemned by the Council of Sens in* 1140.—M. Guizot has pointed out a recent discovery, possessing a high interest for those who devote themselves to the study of philosophy and of its history—the manuscript of the celebrated work of Abelard, entitled, "*Oui et Non*," (*Sic et Non*,) just discovered in the Bibliothèque at Avranches. This work, which was thought to be irreparably lost, is that which caused the condemnation of Abelard, by the Council of Sens, in 1140. M. Cousin is to superintend its publication.

The Landers.—A correspondent at Truro informs us, that the committee lately appointed in that town, to make arrangements for the erection of a column, as a tribute to the intrepidity and enterprise of the African travellers, have come to an agreement, as to the proportions which shall be adopted. It is resolved, that its height shall be 71 feet, and not 56, as was first proposed. The figure to be placed on the top of the column, will be nine feet in height; and the total elevation of the whole, 80 feet. The first cut and squared stone of the column is to be laid at Truro, on the first of March, with Masonic honours; and endeavours are to be used to have the whole work ready by the commencement of July.

Martin Luther.—The German papers mention that a medal has just been struck at Berlin, to commemorate the translation of the Bible, by Luther. The obverse of the medal bears the effigy of Luther, and has the legend "Intrepreter of the Divine Word." The reverse represents Luther delivering an open Bible to Germany, and indicates that the translation was commenced at the Wartburg, and was finished at Wittemberg.

New mode of Staining Rooms.—A new mode of staining paper, or ornamenting rooms, has just been adopted in Paris. By means of wet or liquefied sawdust, a very beautiful appearance is given to wainscoting, equal, it is said, to that caused by the most expensive paper.

Longevity in France.—The patriarch of Normandy, the venerable M. d'Ornay, member of the Rouen Academy of Sciences, has just died in Paris. He was born on the 23d of August, 1729, and was consequently upwards of 100 years old.

Cashmere Shawls.—At Kilghiet, in the district of Soudah, twenty days' journey from Cashmere, is held the great mart for the worsted employed in the manufacture of those soft stuffs used as shawls, and almost as much in demand by the elegant females of Europe as the more voluptuous inmates of the east. There are two qualities of worsted: that which is most readily dyed is white; the other species is of a light ash colour, which cannot, without some difficulty, be rendered sufficiently white, and is more frequently used of the natural colour. One goat rarely furnishes more than two or three pounds of worsted per year. After the shearing, the two qualities are carefully separated; after which they undergo repeated washings in rice water. Great importance is attached to the operation of washing; and the Cashmerians attribute much of the beauty and delicacy of their unrivaled productions to the fine qualities of the waters of their valley. At Kilghiet, the worsted of Cashmere is sold in the rough at about 2*s.* the pound; but, as the preparation and washing occasions a loss of fifty per cent., it is sold ready for the loom at 6*s.* the pound. The form, size, and border, of the shawls vary according to the different markets for which the manufacturer designs them. —*Translated from a Turkish newspaper.*

Lord Brougham was present, on Sunday last, at the lecture delivered by M. Charles Dupin, at the Conservatoire des Arts et Metiers, on the application of Geometry to the Arts. Having finished the immediate subject of his address, the professor said:—"I cannot close this lecture without noticing the honour we have received from the presence of a statesman, who has rendered himself still more illustrious by the benefits he has conferred on the working classes than by his powerful eloquence. It is to him that the three kingdoms of Great Britain owe the institution of those asylums so invaluable to the children of people who pass the whole of their days in working at a distance from their homes. It is to the influence of his powerful and persuasive mind that must be attributed the rapid progress which has been made in teaching the sciences to the working classes—first in Scotland, and soon afterwards in England. In order to diffuse information amongst all ranks of society, Lord Brougham has founded for the higher classes the University of London, and for the inferior classes the Association, or rather we may say the Voluntary University, for teaching to the workmen of Great Britain the Mechanical Arts (the Mechanics' Institute). He was also one of the first promoters of the savings' banks, explaining to the people their present advantages and vast future consequences." After noticing the immense benefits derived from his diffusing elementary instruction by means of cheap publications upon the useful arts and moral principles, and by having given the death-blow to pauperism by his bill on the poor laws, M. Charles Dupin concluded by declaring that Lord Brougham was entitled to the thanks of all mankind for his virtuous example and the benefits he had conferred. This last part of the address was followed by enthusiastic and long continued applause.—*Par. pap.*

Choke damp.—The number of persons lost or destroyed by choke damp and fire damp, in mines and collieries in the county of Lancaster, so far as ascertained by the returns made by the coroners since 1810, is 135.

London butter.—London is estimated to consume nearly forty million pounds of butter, at 1*s.* per lb. to the maker, or two million pounds sterling worth. Cows produce about 168 lbs. per annum, so that London consumes the produce of 280,000 cows.

Capital punishments.—During the second ten years of George III. the capital punishments in London savoured of butchery. Every six weeks there used to be a public procession, from Newgate to Tyburn, of from eight to fifteen and twenty criminals, chiefly youths; and at the drop of the Old Bailey, the executions used to be likened to the suspension of pounds of candles, fifteen or twenty at a time! The number in London is now about 18 per annum.

Pere la Chaise.—The Prefect of the Seine has issued a decree, which fixes 1st Feb. 1835 as the final period for buying up the ground in the cemetery of Pere la Chaise, granted temporarily anterior to 1st Jan. 1821. The ground may be obtained for ever, upon paying the difference in the price between the temporary and the perpetual grant.

Railroad from Paris to Calais.—The surveys and other preliminaries for forming a rail-road from Paris to Calais are completed. Two lines have been under consideration—one by Amiens, and the other by St. Quentin. The latter is conceived to be the best, as offering fewer difficulties, as, by following the banks of the Oise, there are less irregularities of surface and marsh land to go over.—The distance of the two lines is nearly the same, and extends to about eighty leagues. On passing through the Arrondissement of St. Quentin, there must be two tunnels cut—one of 1,000 feet at Tronquoy, and another of 600 feet at Prosel. The expense is estimated at 500,000 francs a league, making in the whole a sum of 40,000,000 francs.

A Bouquet of Fruit.—At the late grand fete at Wentworth House, there was placed in the refreshment-room a *bouquet de fruit*, composed of every variety of grapes, pines, peaches, nectarines, &c. five yards in circumference, and valued at 600*l.*

Nelson's Coffin.—From a part of the mainmast of L'Orient, which was picked up by the Swiftsure, Capt. Hallowell directed his carpenter to make a coffin, which

he afterwards sent to his old friend and commander, Nelson, with the following letter:—"Sir, I have taken the liberty of presenting you with a coffin made from the mainmast of L'Orient, that when you have finished your naval career in this world, you may be buried in one of your trophies. But that that period may be far distant, is the earnest wish of your sincere friend, Benjamin Hallowell." The singular present was received in the spirit in which it was sent. Nelson placed it upright against the bulk-head of his cabin, behind the chair he sat at dinner, where it remained for some time, until his favourite servant prevailed upon him to have it removed, and in this identical coffin the remains of the lamented hero were finally deposited.—*United Service Gazette.*

French Artists in India.—Two French artists lately arrived at Moorshedabad, and, with the permission of the English authorities, executed a figure of the nabob of that place in bronze, which has been placed before his palace. The figure is of large dimensions, and is beautifully executed. The nabob highly complimented the artists on their skill, and after having said prayers before the statue, he gave each of them 25,000 rupees, and some rich dresses.—*Le Voleur.*

Acoustic Tube.—Among the many useful inventions of the present time, there is, perhaps, none that will confer more domestic comfort than the flexible acoustic tube of Messrs. Savory and Co., of the Strand. The material of which it is composed seems to possess the essential qualities for conveying sounds from any distance, without the slightest diminution of their pungency. The manufacturers have affixed to their printed announcement, a very appropriate emblem of its utility in cases of deafness, viz.: "An old gentleman who, of course, is supposed to be very deaf, is represented sitting cozily in his arm-chair by the fireside, listening by means of the tube to an interesting novel read by his daughter at the opposite side of the table."

Mercier's Portraits.—We have already noticed Mr. Mercier's talent in producing a strong and characteristic likeness, in oils, the size of life, at a single sitting—a sitting of one hour's duration! The other day, we paid a second visit to his exhibition, in Old Bond street, and actually enjoyed an opportunity of witnessing the process. A gentleman took his seat in the artist's chair for an hour,—perhaps an hour and ten minutes, but the extra ten minutes did not more than compensate for two or three little rests which the sitter took during the operation. At the expiration of the time mentioned, the painter closed his labour; and it was the opinion of every one present, that the likeness was at once spirited, full of character, and eminently faithful. Independently, however, of the resemblance, the *quantum* of labour performed within an hour was truly astonishing.—*Court Journal.*

Canning's Life Raft.—On Tuesday Mr. Canning personally experimented with his raft in the Thames. The raft can be formed of three spars, or yards, or planks, or any similar thing, that may be at hand, in a few minutes. They are simply lashed together transversely, as a garden chair, the lower ends having barrels or floats attached to them, the upper ones being connected by ropes, so as to form a cradle for the reception of the wrecked sailor. As far as river experiments go, Mr. Canning completely succeeded: the apparatus was towed down the river by a steam boat, and, to try its efficacy, was forced against the abutment of the bridges in passing them, Mr. Canning being in the safety cradle, and escaped unhurt. It is said to be capable of weathering the heaviest seas, and of effecting the object in view, where life boats would be dashed to pieces. A model may be seen at the National Gallery of Practical Science.

Junction of the Rhine with the Danube.—The following particulars are given in a private letter from Munich, dated October 8:—The government of Bavaria is now anxiously occupied with the consideration of a plan for uniting the Rhine with the Danube by means of a canal. According to the law which received the sanction of the Bavarian Chambers, the canal will be completed by a company of shareholders, but the government is to have the power to take one quarter of the shares. The maximum of toll which the proprietors of the canal are authorised to exact, during 99 years, is fixed at one third of the price which would be charged by wagon for the same distance. The canal will have its source in the Danube, near Kellheim. Its course will follow the valley of the small river d'Altmuhl and the Sulz, as far as Neumark; from thence the canal will pass in the direction of Nuremburg, and pass the river Reignitz, by Furth and Bamberg. Its length will be 592,543 Bavarian feet, or 23¼ German miles. Its breadth will be 54 Bavarian feet, and its depth 34. The highest elevation of the canal will be 273 feet above the surface of the Danube, near Kellheim, and 630 feet above the surface of the Reignitz, near Bamberg. This elevation will be attained by means of 94 locks.—*Morning Herald.*

Bibliotheca Heberiana.—We have watched the progress of the first six days' sale of this portion of Heber's Library with much interest. These noble remains, which in their original form exhibit the genius of our early poets, and the manners, customs, and habits of the ancient times, are dispersed for ever. Their sale commenced at Evans's on Monday last. Chaucer's Canterbury Tales, a second edition, imperfect, brought 78*l.* 13*s.*; Chaucer's Canterbury Tales, printed by Pynson, one leaf supplied by fac simile, 60*l.* 18*s.*; a very curious series of Old Ballads dispersed through several lots, but formerly bound in one volume, purchased by Heber from Thorpe, the well known bookseller of Bedford street, sold for 130*l.*—these "rare matters" have reverted again to Thorpe; a volume of Old Ballads, 49*l.*; Boetius, translated into English metre by J. Walton, and printed in the Monastery of Tavistock in 1424, produced 63*l.* and was very properly purchased by the Duke of Bedford; Barclay's Eclogues, printed by Pynson, 24*l.* 16*s.*; History of the Four Sons of Aymen, printed by Wynkyn de Worde, 32*l.*; Barnabe Googe's Eclogues, duodecimo, first edition, and undoubtedly the most beautiful book of its class in this vast collection, 16*l.* 5*s.*—it was bought by Heber in the sale of George Steevens' library, for about 10*l.*; Guy of Warwick, a metrical romance, 25*l.*; Chronicle of England, imprinted by General de Leew, 37*l.* 16*s.* Did our limits permit, we would record the prices of the various works of Churchyard, Gascoigne, Dekker, and Greene. The drolleries, upon the whole, produced a larger sum than Heber paid for them, as did many of the books relating to Ireland. The amount of the past week far exceeded three thousand pounds. The literary treasures in the present week's sale at least equal those of the past. The large paper copy of Holinshed is the one known to contain the original castrations; this ought to be secured by a public library as a national document.

The Princess Olivia.—The self-styled Princess Olivia of Cumberland, who, a few years since, was almost daily before the public, in endeavouring to establish her claim to royalty, died on the 21st instant.

Literature in Ireland.—Literature is at a very low ebb in Galway. No regular bookseller's shop is to be found in this town, containing between 30,000 and 40,000 inhabitants; there are shops, indeed, where books may be ordered, and where some books may be purchased; but the demand is not sufficient to support a shop which sells books solely. I need scarcely say, that the town contains no public or circulating library; and I could not learn that either in the town, or in its neighbourhood, any private book society existed. * * * It is a singular fact that in such a town as Londonderry, there should be no circulating, or public library. Several attempts to establish these have failed, and I could not even learn that any private book society existed.—*Inglis's Ireland.*

"*Fosdick's Translation of De Sacy's General Grammar.*" This is a valuable American work imported by Mr. Rich. The seminary at Andover has recently produced several very valuable works on education, which deserve to be extensively known in this country; but perhaps there is not among them one of greater merit than this little volume. Baron De Sacy's talents, as a linguist and grammarian, are too well known to need our notice. In this work he has brought all his varied acquirements to bear on the elucidation of the philosophical principles of general grammar. The translator has performed his task with great ability and fidelity, and added much valuable illustration.—*Athenæum.*

Marine Artificial Horizon.—Lieut. H. A. Becher has, we are informed, succeeded in producing this desideratum, by a machine of simple construction and of small size. It is founded on the principle that the same fluid (in this case, mercury) preserves its level when distributed in different tubes; and the experiment has been found to answer when tried in the north seas by day, by Captain Hewett of the Fairy.

Lord Napier and the Chinese.—We are informed, by a correspondent, whose letter reached us by the last arrival from Canton, that a very small blunder apparently, and what we should deem a mere act of common courtesy, has exposed Lord Napier to the loud laughter and universal ridicule of the Chinese. The King of England, too, comes in for a share of the contempt which his representative labours under.

It appears that Lord Napier took formal leave of the court of merchants, after an interview with them, in the way that one gentleman would of another in England. He made his obeisance and retired. This the Chinese consider as supremely despicable in the king's representative; and the English residents in Canton are constantly saluted with the following satirical remarks, in reference to the unfortunate obeisance. "Very curioo! I no unerstand! King man go chin, chin one tea merchant! Here fashion!"

Queer Custom.—Part of the road leading from Whissendine to Melton Mowbry lies through the preserves of the Earl of Harborough, upon which about a dozen boys with clappers, horns, rattles, and various other instruments more noisy than musical, are stationed: on the appearance of any person with a gun upon the road, he is quickly surrounded by this clamorous group, who ply their various engines with such a vengeance as not only to frighten the game beyond the shooting distance of the suspected individual, but absolutely to put many of his majesty's harmless equestrian lieges in bodily fear. This uproarious little band is marshaled and disciplined by two men, one acting as commander-in-chief, and the other as a sort of adjutant; if the boys be not in sight of the principal or his assistant when a stranger appears, they are summoned to the spot by a stentorian "Yoicks" and "Halloo" that would do credit to the lungs of a practised huntsman; forthwith the uproar commences, and it continues till the poor persecuted wight is beyond the limits of the manor.—*Lincoln Mercury.*

Richard Carlile again.—The court was occupied for several hours on Monday with the trial of Richard Carlile, "for having, on the Lord's-day as well as on other days, exhibited two figures in the windows of the first floor of the house No. 62, Fleet street, the one representing a bishop of the established church, and the other a person in ordinary apparel, under the latter being written the words 'temporal broker,' and under the former the words 'spiritual broker,' with other inscriptions, describing them as two props of the church." This was described as a nuisance, on account of the crowds that it collected, as well as its public indecorum. Carlile defended himself, and frequently gave offence to Judge Park by his irreverent remarks on the established church. He was found guilty; but judgment was respited and the prisoner suffered to go at large on bail, on the understanding that the nuisance should be abated.—*Examiner.*

Fraser's Magazine and the Cooks.—In the court of king's bench, on Monday, M. Prudhomme, French cook to the Earl Grey, obtained a verdict with 50*l.* damages against the publisher of *Fraser's Magazine*, for a libel on his character, which had appeared in an article of the Magazine for December 1833. The article in question was entitled "Household Servants;" and amongst other things it was alleged, that there was not an honest servant in England, and a statement was made with reference to "the French cook of a great political earl," imputing fraud to him, the charge being that he was in the habit of overcharging his employer in the price and quantity of his charcoal; it was further stated that the charcoal-seller could prove the fact if called upon. The article having gone the round of the papers, a friend of the plaintiff called on Mr. Fraser; who refused to contradict the statement. On the trial, the main defence which Sir James Scarlett offered for his client the publisher, resolved into a denial of the application of the libel to the plaintiff.

Theft.—On Saturday evening, between the hours of six and eight o'clock, some thieves got, unperceived, into the shop of Mr. H. Grittin's looking-glass warehouse, at the corner of Duncannon street and Trafalgar square, St. Martin's lane, and stole the silver-gilt vase or cup, weighing two hundred ounces, presented by the late Lord Byron and the committee of Drury lane theatre to the late Edmund Kean the tragedian, in 1816. Lord Byron's and the whole of the committee and performers' names are inscribed on the cup. A large reward is offered for the apprehension of the thieves.

Ruins of the House of Lords.—One of our Paris newspapers says that in digging among the ruins of the house of lords, in order to ascertain the heat of the smouldering embers, the workmen discovered on the spot over which the woolsack stood, some large masses of *glass*, in a state of fusion, and several *corkscrews!!!*

New Strand Theatre.——A Mrs. Wylett has taken New Strand Theatre in London, which magistrates refuse to license and the lord chamberlain to countenance; she evades the prohibition of taking money by the ingenious scheme of giving admission gratis to purchasers of tickets for the Victoria, at the office close to the Strand Theatre door, and other places named in the bills.

Mrs. Somerville and the Emperor of Russia.—The Emperor of Russia has sent from Petersburg, and commanded to be presented to Mrs. Somerville, author of the well-known work "On the Connection of the Physical Sciences," an extremely valuable opal, set with brilliants of the first water, "as a token of his sincere regard and admiration" of that lady's distinguished talents.

Tomline's Life of Pitt.—The publication of the first portion of the Life of William Pitt, by Prettyman Tomline, the Bishop of Winchester, (tutor to the premier when at Pembrokehall, Cambridge, and subsequently his private secretary,) gave great offence to George IV., in consequence of the insertion of one or two private and confidential letters from his father to Pitt whilst he was prime minister. The remainder of the work is said to be finished in MS., and in possession of the bishop's son. A short time before Tomline's death, he was asked by a noble friend when he intended to print the remainder of his Life of Pitt; the bishop answered, "My lord, I am getting a very old man."

Philip not Jacob.—A Frenchman, stopping at a tavern, asked for Jacob: "There is no such person here," said the landlord. "'Tis not any person I want, sare, but de beer make warm wid de poker." "Well," answered mine host, "that is flip." "Aye, yes, sare, you are in de right—I mean *Philip.*"

West's Pictures.—By a curious calculation, it was ascertained that to contain all West's pictures, a gallery

would be necessary four hundred feet long, fifty broad, and forty high.

Princess of Beira.—The day after the interment of the late Donna Francisca, the Princess of Beira, with the Infant of Spain, proceeded to London, and the first thing done on her arrival was to dispose of Francisca's jewels, at her desire, and transmit the proceeds of them to Portsmouth, for the poor Spaniards there, where this relief very opportunely arrived last week.—*Hampshire Telegraph.*

Refusal to be Pardoned.—A very curious bit of personal news has arrived this week from Sweden. Captain Laideberg, who had been pardoned by the king, after being convicted of treason, persists in repudiating the favour intended him, and declares his resolution of dying by the hands of the executioner. He will die, he says, in preference, on his birth-day the 8th November, believing "that his head falling under the executioner's axe will do more service to his country than if it remained on his shoulders." The authorities have been attempting to reason with him, but he is quite inexorable!

Painter's Copyrights.—The right of painters to give or withhold permission to engrave their works, even when sold, has recently been brought under the consideration of a legal tribunal in Paris. "Does the right to have an engraving made from a picture belong to the purchaser of the picture, or does it remain with the painter, even after the sale of his picture?" This was the question brought before the court with reference to an engraving of Gerard's picture of the Battle of Austerlitz. The court decided in favour of the painter's exclusive right.

An Editorial Priest.—The Carlists of France are getting some wisdom. They are turning their newspaper editors into priests:—M. de Genoude, the late editor of the *Gazette de France*, was consecrated sub-deacon, at the ordination which took place at Versailles on the Saturday previous to the last ember week. The day before he performed the functions of sub-deacon, and chanted the epistle at the first mass of a newly-ordained young priest. M. de Genoude is therefore now fairly embarked in the ecclesiastical state.

The Ship-carriage.—A letter from Paris says, that the ship-carriage, which was so much talked of, has proved a complete failure. It was to have started on Monday for the Champ de Mars, and had several sails set, but no progress was made, although the wind was very favourable. Several men were at one time employed to aid its progress, but the result was such, as to convince even the inventor that the plan was a total failure.

A new Fish-sauce.—A countryman arrived at London was desirous of following the newest fashion. He heard gas was spoken of as being very superior to oil, but he had not the courage to ask any explanation on the subject. Going to dine at a chop-house, he ordered some turbot, and on being asked by the waiter whether he would take oil with his fish, he answered, "No, I wish to try the new mode; give it me with gas."—*The Cook.*

Statue to Cuvier.—The model of the statue to be erected to the memory of Baron Cuvier, has just been completed in Paris by M. David. Cuvier is represented in the attitude of profound meditation. In one hand he holds a pencil, and in the other a paper, on which are sketched the Mastodonte, in a perfect state, and its skeleton. Near the statue is a half pillar, on which rests the jaw-bone of the Mastodonte, which enabled Cuvier to discover the complete structure of the animal, previously unknown. The statue is to be erected at Montbeliard, Cuvier's native town.

The Original of the Story of Colonel Kirk.—A governor of Zealand, under the bold Duke of Burgundy, had in vain sought to seduce the affections of the beautiful wife of a citizen. The governor imprisons the husband on an accusation of treason; and when the wife appeared as the suppliant, the governor, after no brief eloquence, succeeded as a lover, on the plea that her husband's life could only be spared by her compliance. The woman, in tears and in aversion, and not without a hope of vengeance only delayed, lost her honour. Pointing to the prison, the governor told her, "If you seek your husband, enter there, and take him along with you." The wife, in the bitterness of her thoughts, yet not without the consolation that she had snatched her husband from the grave, passed into the prison; there, in a cell, to her astonishment and horror, she beheld the corpse of her husband laid out in a coffin, ready for burial. Mourning over it, she at length returned to the governor, fiercely exclaiming, "You have kept your word! you have restored me my husband! and be assured the favour shall be repaid!" The inhuman villain, terrified in the presence of his intrepid victim, attempted to appease her vengeance, and more, to win her to his wishes. Returning home, she assembled her friends, revealed her whole story, and under their protection she appealed to Charles the Bold, a strict lover of justice, and who now awarded a singular but an exemplary catastrophe. The duke first commanded that the criminal governor should instantly marry the woman whom he had made a widow, and at the same time sign his will, with a clause importing that should he die before his lady he constituted her his heiress. All this was concealed from both sides, rather to satisfy the duke than the parties themselves. This done, the unhappy woman was dismissed alone. The governor was conducted to the prison to suffer the same death he had inflicted on the husband of his wife; and when this lady was desired once more to enter the prison, she beheld her second husband headless in his coffin as she had her first. Such extraordinary incidents in so short a period overpowered the feeble frame of the sufferer; she died—leaving a son, who inherited the rich accession of fortune so fatally obtained by his injured and suffering mother.—*D'Israeli's Curiosities of Literature.*

Submersion of Port Royal.—In the midst of much prosperity, and when the colonists were exulting in their good fortune, the town of Port Royal, in Jamaica, into which the wealth of the buccaneers had been poured, and on whose shores their crimes and wickedness had been felt, by the awful interposition of Providence, was suddenly destroyed, and its inhabitants instantly engulphed in the earthquake, which entombed the scene of so much depravity for ever! On the 7th of June 1692, at mid-day, while the governor and council were sitting, and the wharfs were loaded with merchandise and rich spoil, a roar was heard in the distant mountains, and reverberated through the vallies to the beach, where the sea suddenly arose, and in an instant stood five fathoms deep, where, a moment before, were displayed the glittering treasures of Peru and Mexico; in some places the earth opened wide and swallowed whole houses, which were again, perhaps, thrown upwards by the violent concussion of the sea; in others, many individuals were swallowed up to the neck, and the earth then closing, strangled them; the *Swan* frigate was forced over the tops of sunken houses, and afforded a providential escape to many persons; and of the whole town, perhaps the richest spot in the world, not more than two hundred houses of the fort were left. The whole island felt severely the shock, in some parts mountains were riven, in others connected, the outline of every thing was changed, and the entire surface of the island considerably subsided; many thousand persons were destroyed in the overwhelming of Port Royal, the ruins of which are yet visible in clear weather from the surface of the ocean, beneath which they lie.—*From Montgomery Martin's History of the British Colonies.*

Popularity of Milton and Shakspeare.—The English flatter themselves by a pretence that Shakspeare and Milton are popular in England. It is good taste, indeed, to wish to have it believed that those poets are popular.

Their names are so; but if it be said that the works of Shakspeare and Milton are popular—that is, liked and studied—among the wide circle whom it is now the fashion to talk of as enlightened, we are obliged to express our doubts whether a grosser delusion was ever promulgated. Not a play of Shakspeare's can be ventured on the London stage without mutilation, and without the most revolting balderdash foisted into the rents made by managers in his divine dramas; nay, it is only some three or four of his pieces that can be borne at all by our all intelligent public, unless the burthen be lightened by dancing, singing, or processioning. This for the stage. But is it otherwise with "the *reading* public?" We believe it is worse; we think, verily, that the apprentice or his master who sits out Othello or Richard at the theatres, does get a sort of glimpse, a touch, an atmosphere of intellectual grandeur; but he could not keep himself awake during the perusal of that which he admires—or fancies he admires—in scenic representation. As to understanding Shakspeare—as to entering into all Shakspeare's thoughts and feelings—as to seeing the idea of Hamlet, or Lear, or Othello, as Shakspeare saw it—this we believe falls, and can only fall, to the lot of the really cultivated few, and of those who may have so much of the temperament of genius in themselves, as to comprehend and sympathise with the criticism of men of genius." Shakespeare is now popular by name, because, in the first place, great men, more on a level with the rest of mankind, have said that he is admirable, and also because in the absolute universality of his genius, he has presented points to all. Every man, woman, and child, may pick at least one flower from his garden, the name and scent of which are familiar. To all which must of course be added, the effect of theatrical representation, be that representation what it may. There are tens of thousands of persons in this country whose only acquaintance with Shakspeare, such as it is, is through the stage.—*Quarterly Review.*

Ant Plague in Grenada—Their numbers were so immense as to cover the roads for the space of several miles; and so crowded in many places, that the prints of the horses' feet were distinctly marked amongst them till filled by the surrounding multitudes. They made bridges across large and rapid rivers with the dead bodies of their comrades. Every kind of cold victuals, all species of vermin, particularly rats, and even the sores of the Negroes, were exposed to their attacks. A premium of 20,000*l.* from the public treasury was offered to the discoverer of any effectual method of destroying them, and the principal means employed were poison and fire. By mixing arsenic and corrosive sublimate with animal substances, myriads were destroyed; and the slightest tasting of the poison rendered them so outrageous as to devour one another. Lines of red-hot charcoal were laid in their way, to which they crowded in such numbers as to extinguish it with their bodies; and holes full of fire were dug in the cane grounds, which were soon extinguished by heaps of dead. But while the nests remained undisturbed, new progenies appeared, as numerous as ever, and the only effectual check which they received, was from the destructive hurricane which, by tearing up altogether, or so loosening the roots of the plants where they nestled as to admit the rain, almost extirpated the whole race.—*From Montgomery Martin's History of the British Colonies.*

Manner of Keeping Horses in Cabool.—Nothing strikes a stranger in this country more than the manner of keeping their horses, which differ so much from India. They never remove the saddle during the day, which they believe gives the horse a better rest at night. They never walk a horse up and down, but either mount him, or make him go round in a circle till he is cool. They give no grain, at this season, feeding them on green barley, which has not eared. They picket eight or ten horses to two ropes, which they fix in line parallel to one another. They always tie a knot on the tail. They keep the hind quarters of the horse covered at all times by very neat felt, fringed with silk, which is held on by the crupper. They use the Uzbek saddle, which resembles that of our own hussars, and which I found agreeable enough, and always used. The riders tie their whip to the wrist. The Afghans take great care of their horses, but do not pamper them with spices, as in India and always have them in excellent condition.—*Burnes's Travels into Bokhara.*

Literary Intelligence.

—

DENMARK.

The 8th vol. of the *Scriptures Rerum Danicarum* has recently appeared at Copenhagen. The 7th vol. was published in 1793, and the printing of the 8th was then commenced; it was far advanced, when the whole impression became the prey of a conflagration which only spared two copies. The 9th vol. will complete the work, and will contain a general index.

FRANCE.

The second part of the 5th volume of M. Quérard's laborious and admirable Dictionary of French Literature, entitled *La France Littéraire*, has just made its appearance. It contains a small portion of the letter *M*; consequently the author may be considered to have completed one half of his undertaking. We sincerely hope that he will live to finish the other half. It is impossible for any one who has not had frequent occasion to consult and refer to this work, to form an idea of the immense labour which it must have required, or sufficiently to appreciate the industry, the patient research, and the minute accuracy which the author has every where displayed. The short notices of the little known and obscure authors and their productions have a merit of their own, as great as the larger and more elaborate ones dedicated to celebrated or distinguished names. In this department of literature the French and Germans very much surpass us. It will be long indeed, we fear, before we have a Dictionary of British Authors and their works, that will bear any comparison with the work before us.

The autograph MS. of the Memoirs of Cardinal de Retz has been recently discovered in the royal library among the papers of Count Réal, and has attracted a good deal of attention. Numerous passages of great interest are marked for erasure, which do not appear in the printed editions.

A *History of Corsica*, by M. Jacobi, advocate, will be shortly published, in 2 vols. 8vo. It will include the topography, scenery, and statistics of the island, interspersed with some of those touching and romantic episodes with which its history abounds.

A French translation of Lieutenant Burnes's interesting Travels to Bokhara, &c. has been announced as in preparation at Paris, with notes by Klaproth, the distinguished Orientalist.

Professor Schroeder, of Upsal, in Sweden, is now at Paris for the purpose of searching among the public libraries for materials to complete the great collection of Swedish Historians of the Middle Ages, edited by him, and of which three volumes in folio have already appeared.

A *History of Russia*, compiled from the national chronicles, is announced, in 1 vol. 12mo., by Louis Paris,

the translator of Nestor's Chronicle. The same author has in the press *La Chronique de Reims. recit historique de* 1938 *à* 1260; now published for the first time from the unique MS. in the king's library.

A new edition of the *Collection of Memoirs relative to the History of France*, from the 13th to the end of the 18th century, inclusive, is announced for publication, in 20 vols. royal 8vo., distributed in 80 livraisons, one of which will appear every ten days. M. Michaud, the academician, and M. Poujalat, the companion of his late travels in the east, will discharge the duties of editorship, supply the necessary explanatory and other notes, &c. &c. By means of printing in a smaller type and in double columns, it is calculated (but the accuracy of this calculation is denied in the strongest terms by the proprietors of Petitot,) that these twenty volumes will include the whole two series of Petitot's collection, in 130 vols. 8vo. at a price not exceeding one-fourth of that. It will proceed chronologically, beginning with Geoffrey Villehardouin, and ending with Saint Simon.

The royal printing office of Paris possesses the type of 56 Oriental alphabets, comprehending all the known characters of the languages of Asia, ancient as well as modern; and 16 alphabets of those European nations who do not employ the Roman character. Of these the royal printing press possesses 46 complete founts of various forms and sizes. All these together weigh at least 750,000 lbs., and as the types of an 8vo. page weigh about 6 lbs. this establishment is able to compose, simultaneously, 7812 8vo. sheets, forming nearly 260 volumes, or 125,000 pages. The number of presses employed enables it to throw off 278,000 sheets per day, or 556 reams of paper, equal to 9266 volumes in 8vo. of 30 sheets each. The annual consumption of paper by the royal printing office is from 80 to 100,000 reams, or from 261 to 326 reams per working day. The number of workmen constantly employed is about 350.

The 19th volume of M. Sismondi's *Histoire des Français*, just published, comes down to the year 1580, consequently it includes the massacre of St. Bartholomew.

A curious little work has recently appeared, intituled *Les Amours, les Ouvrages d'Héloise et d'Abélard;* it is translated from the edition of 1616, now become excessively rare, and is illustrated with notes by M. Villenane, formerly professor at the Athenæum of Paris.

GERMANY.

Professor Ellendt, of Konigsberg, has nearly completed e *Lexicon Sophoclæum*, forming a complete repertory of the labours of grammarians and philologists, for the elucidation of the great Greek tragic poet. The work will appear in May next, in 2 vols. 8vo.

The Posthumous Works of the German philosopher *Fichte*, are announced for publication, in 3 vols. 8vo.

A Map of the Moon is announced as in preparation by Messrs. Beer and Maedler, which, from the promises held out as to its execution, we should judge well worthy of attention of astronomers.

M. Heinrigs, of Berlin, has published the first part of a Collection of European Manuscript Alphabets of ancient and modern times.

The first volume of a new edition of Suidas's Greek Lexicon, printed in quarto, from the text of the Milan edition, edited and illustrated by Professor Bernhardy, has just made its appearance at Halle.

The splendid collection of coloured engravings published by Messrs. Boisserée and Bertram, of the old German and Flemish pictures now in the Munich Gallery, is brought to a conclusion; the 38th livraison, recently published, completes it.

A complete edition, in one volume 8vo. of the Poetical Works of Voss, is announced for publication. The *translations* will not be included.

A Physical Description of the Earth, is preparing for publication by Baron Humboldt.

A narrative of the first Prussian *Voyage round the World*, by H. H. S. Louise, under the command of Captain Wendt, during the years 1830 to 1832, drawn up by Dr. Meyen, the naturalist attached to the expedition, has just appeared at Berlin, in two volumes quarto.

An institution or endowment is announced to be formed in memory of the celebrated theologian and philologist Schleiermacher, and to be named after him, for the purpose of enabling young men, students of theology in the University of Berlin, who have previously distinguished themselves by their attainments, to devote themselves exclusively, and with minds undisturbed by pecuniary cases, to their studies for the entire period of their university career, and in cases that may be deemed fit, even after that period. The management of this institution to be in the hands of the twelve founders, in whose name an appeal has been lately put forth to the well-wishers of such an institution, for pecuniary assistance to carry its objects into effect. The name of these founders Messrs. Eichhorn, the two Humboldts, two Neanders, Savigny, Fostner, Nikolovius, Steffens, Hofbach, Pischon, and Strauss.

M. Von Hammer having completed the first edition of the *History of the Ottoman Empire*, is now busily engaged in passing a second through the press, considerably improved. The first and second volumes, published in livraisons, have already appeared.

The fourth volume of Raumer's *History of Europe since the end of the 15th Century*, has just made its appearance.

An important work by M. Keferstein has just appeared at Leipsic, in two volumes, on the Physiology of the Earth, Geognosy, Geology, and Palæontology (Fossilogy.) The latter part contains a voluminous catalogue, with the Latin names, of all the known fossils of either the animal or vegetable kingdom.

The first volume of M. Erman's *Travels round the World, through the Forth of Asia, and both Oceans, in the years* 1828, 1829, *and* 1830, which has recently appeared at Berlin, contains his *Journey from Berlin to the Frozen Ocean*. The sequel is looked for with great interest.

RUSSIA.

In no country in Europe does the government take such an active interest in the publication of journals as in Russia. Almost every principal branch of administration possesses a journal through which its proceedings, plans, and means of execution, are communicated to the public. During the year 1833 there was published in the Russian language, 40 journals and newspapers; of which 24 were published at St. Petersburgh, 10 at Moscow, three at Odessa, two at Revel, and one at Kasan. Five of these were devoted to political subjects, 13 to literature, and the remaining 22 to various branches of science; and were edited, for the most part, by individuals connected with the government. These are independent of the journals that are published in German and in French, of which there are several.

Prince Protojon, the present Hetman of the Cossacks, has just translated the poems of Parny into the Calmuc language. We think he might have made a more judicious choice.

ORIENTAL LITERATURE.

M. G. Pauthier has announced a translation of the Political, Moral, and Philosophical Works of Confucius (Kong-fou-tseu) and of Mencius (Mengtseu), the two most celebrated Chinese philosophers, accompanied with the original Chinese text. These writings are what are called by the Chinese the *See-Chou*, (the Four Books); they form the basis of the instruction of youth in all the colleges of the empire;—they are the books held in the

highest estimotion by the Chinese literati, of whose contents all who are designed for the career of letters or administration must make themselves masters, and even get by heart. The work will form two volumes in royal 8vo. (price 50 francs, or 2*l*) and will be sent to press as soon as a sufficient number of subscribers are found to defray the expense of printing.

M. Von Hammer has published an edition of the *Rose and the Nightingale*, poem, by Fazli, a Turkish poet, in the original, with a German translation.

An edition of the Gulistan of Sadi, in the original Persian, with a French translation, and critical and historical notes by M. Semelet, has just appeared at Paris, in 1 vol. 4to.

ENGLAND.

Mr. Charles Richardson is preparing a new Dictionary of the English Language, in which the explanation of the words commences with the etymological or intrinsic meaning, their various applications in use are traced in orderly connection, and the quotations in illustration, are arranged chronologically from the most ancient to the most modern authors.

In the press, a Tour through North America, together with a Comprehensive View of the Canadas and the United States, as adapted for Agricultural Emigration. By Patrick Shirreff, Farmer, East Lothian.

A work is in course of preparation, entitled, "History and Present State of Van Dieman's Land," (with the official correspondence on the subject of "Secondary Punishments.") By George Day Wood, Esq.

A Booksellers' Assistants' Society has recenly been formed at Leipzic, the objects of which are stated to be the promotion, after the labours of the day, of friendly intercourse and improvement, by means of a library, lectures, and a reading-room. Classes will also be formed for instruction in the most useful living languages. The lectures are to embrace the various arts connected with bookselling, such as letter-founding, printing, book-binding, paper-making, copper and wood engraving, lithography, &c.—*Foreign Quarterly Review.*

A Brochure, entitled England, France, Russia, and Turkey, is nearly ready for the press.

Mr. John Leigh, Jun. is preparing for publication, in a cheap form, Directions for insuring personal Safety during Storms of Thunder and Lightning, and for the right Application of Conductors to Houses and other Buildings.

The ethical portion of Kant's "Transcendental Philosophy," his "Kritik der praktischen Verneinft," or Critical Canons of Practical Reason, is likely soon to appear in an English garb.

Serials.—The most novel undertaking in this class of literature is Mr. Valpy's *Summaries of the Sermons and Discourses of the most Eminent British Divines*, conducted by the Reverend T. S. Hughes. The work is chiefly addressed to clergymen and divinity students. The object is to furnish them with the ready-made outlines of a sermon, which they are to fill up. The mode pursued is to present the skeleton of the discourse only; retaining the order, the arguments, and, as it were, the key-notes; leaving out the ripeness, the fulness, the fancy, and the eloquence of the original. By this means, a great saving of space and money is effected—in a single part of little more than 120 pages, we have the pith of forty-two sermons: the vigorous power required to digest the pure essence forbids any hope of saving time. Their use, of course, must depend upon the character of the user: he who will take them as texts, which he is to expand, and compare his performance with the original, will assuredly profit by his labour: he who looks upon them as means of evading exertions—as spirit which he is to dilute—will neither benefit himself nor his hearers. Judging from the specimen before us, the work will be carefully and skilfully done. The abridgment reads continuously, and preserves the effect of a whole. However carefully perused, the literary merit of the sermons, as compositions, of course evaporates; but we think their effect as pieces of reasoning is greater. The eloquence of poesy of our older divines is gone; but the logician is more distinctly seen.

The eighth volume of Sir Walter Scott's Prose Works commences the "Life of Napoleon." The preface informs us that

"Sir Walter Scott left two interleaved copies of his Life of Napoleon; in both of which his executors have found various corrections of the text, and additional notes. They were directed, by his testament, to take care that, in case a new edition of the work were called for, the annotations of it might be completed in the fashion here adopted, dates and other marginal elucidations regularly introduced, and the text itself, wherever there appeared any redundancy of statement, abridged. With these instructions, except the last, the editor has now endeavoured to comply."

As the introductory "View of the French Revolution" is all that is contained in the present volume, we cannot tell how how far the correctness extends, or whether Sir Walter, in his subsequent researches, saw cause to modify his opinions about Barras, Josephine, and the "Little Corsican," and to render the hero's advancement less like a romance.

The sixty-first number of Lardner's Cabinet Cyclopædia completes Sismondi's History of the Fall of the Roman Empire, coming down to the year 1000. Our opinion of the work has been already given briefly: but we may repeat our former intimation, that the two volumes are necessary, and the purchase safe. If the reader has Gibbon, the two writers will illustrate each other; if he has not, Sismondi may in a measure supply the place of the great historian.

The current republication of the Romance of History is devoted to Don T. Trueba's Spain; of which we have the first volume.

The twelfth number of the Sacred Classics commences Cave's Primitive Christianity; a favourable exposition of the faith, morals, and habits of the primitive converts. It is preceded by a useful and sensible introduction, from the pen of the Rev. W. Trollope, who has occasionally illustrated his author by notes. The work will be completed in another volume.

The eleventh volume of Valpy's England brings Smollett's History of "George the Second" down to April, 1755. The illustrations are a vignette representing the Pretender's escape, and a plate of the battle of Culloden, in which the Duke of Cumberland is made to look in point of bulk and burliness very much like a butcher.

Three Encyclopædias come next. 1. The fifty-sixth part of the Encyclopædia Britannica; which completes the "Funding System," finishes the letter F, and begins G. The most important papers are "Gardening," "Gas Light," and the commencement of "Geography," together with a life of "Gall," the craniologist. 2. The tenth part of the Encyclopædia of Geography; which concludes the African Continent, and begins the Islands. 3. The Encyclopædia of Gardening; whose thirteenth number is entirely devoted to matters of every-day taste and utility. The culture of the peach, the cherry, the melon, the cucumber, the cauliflower, the pea, and very many other vegetables of constant occurrence, are discussed and expounded with Mr. Loudon's wonted skill and practical sagacity.

Jours tr. Leigh Hunt.

AUTHOR OF "BYRON & HIS CONTEMPORARIES."

From Fraser's Magazine.

LEIGH HUNT, ESQ.

Leigh Hunt complained sadly of the pickpocket look which the malice or want of skill of an engraver had conferred on that copy of his countenance which decorated his book about Lord Byron. We hope that he will think our artist has succeeded better; although truth compels us to confess that there is not much of the style noble in the physiognomy of the *ci-devant* sonnetteer of Hampstead, even though "its intelligence relieves it from insignificance."

Hunt has written in a hundred different places all the particulars of his personal history, and we are thereby relieved from any pressing necessity of expatiating on his biography. He was once very warlike with his pen, and fond of controversy—but that occurred when he was *calidus juventâ:*

In his hot youth, when George the Third was King.

Time and the wear of the world has smoothed the roughness of his ire, and his quills bristle not for the conflict as of old. Once upon a time he was ready to attack every body, from the prince regent down to the poor scene-shifter; and he tells us he then thought that a satire was nothing more than "a pleasant thing in a book." He felt the difference when the northerns dubbed him King of the Cockneys. He is now far more tolerant of mankind; but he still preserves in considerable bloom all the grand characteristics of his original career,—the jauntiness and greenery, the theatrical orange-suckery, the suburban relishes, the admiration of all that is of the town towny. He prattles as ever of green fields, and fancies that he knows something of fine breeding and the fine air of a gentleman of the west end. His pet words still cling to him in spite of all vicissitudes of time and fortune; and it is impossible to mistake an article of his, whether marked by the ruffled ☞ or not. By the way, he ought to put a sham diamond ring on the index finger—it would look more sparkish; or sport a daffydowndilly from the back of Jack Straw's in the hand, thereby to show that the farmy fields of Hampstead are not forgotten.

We grieved somewhat, on looking over his last edition of *Rimini*, when we missed the old familiar faces of these five lines, which had excited the savage criticism of Gifford. It was weak of Hunt to leave out these purple patches—

"The thigh broad spread—the pressing thumb upon it;
And the jerked feather swaling in the bonnet;"

or,

"The two divinest things the world has got—
A lovely woman on a rural—spot;"

or,

"She had stout notions on the marrying score;"

or the hundred magnificent words which had called up the bile of the critical *sutor* who smote Hunt with his *crepida*. The poem did not appear to us any thing like what it was some—almost twenty years ago, when we read it with infinite gratification, chiefly on account of these charming specimens of composition. Why should he have cared for critics? They were no friends of his. And had we been Hunt we should have stuffed the poem ten times fuller of Cockneyisms, and not abated a rhyme to oblige the non-residents of London, who think that Anna ought not to be pronounced Annar. We should have shown the provincials our intense contempt of their notions of the English tongue, and in the honour of Bow-bell have rhymed tobacco with Long Acre, as in the days of old.

He is now coming somewhat beyond that *mezzo cammin* of which Dante sings, and fortune has not smiled upon him. The party to which he formerly attached himself is in power, but all his old labours in the libel line on their behalf are forgotten. Those who abused the prince regent with far greater virulence than Hunt ever did are high in office, and glorying in their elevation. They have of course left him to struggle as he can. We hope that his struggling is successful—we understand, indeed, that his *Journal* has, as it deserves to have, a prosperous sale. It is as refreshing as his former productions, and of a pleasanter spirit. He has been an excessively ill-used man in many respects, and by none more than by Lord Byron, and those who panegyrise his lordship,—

"With the twaddle of Allan, the meanness of Moore."

And so fare thee well, and prosper, "Signor Le Hunto, gran gloria di Cocagna."

RECENT DISCOVERIES AT POMPEII.

At Pompeii there has been lately opened the street leading from the Temple of Fortune to the gates of Isis, passing nearly through the middle of the town. On reaching a central point from which streets diverge to the theatre and to the walls of the city, there was found an altar placed before the protecting genius of the town, in the form of a serpent; the faces of the altar are ornamented with paintings representing the priests offering libations and other sacrifices. On exploring two shops in the streets of Fortune, there was discovered a pair of bronze scales and a weight in the shape of a pear, a bronze dish, with handles, a hatchet, and one small cylindrical object made of bone and perforated, supposed to have been used either in some female works or for making calculations. A house has been discovered behind the grand Mosaic, comprising a vestibule, several sleeping rooms ornamented with simplicity, and a tabulum or host adorned with the most exquisite paintings of stueco. In this house was found a bronze shell, of elegant workmanship, an earthen lamp, black with smoke, vessels containing colours, and a wooden chest lined with iron, and surrounded by figures formed with brass nails.—*German Paper.*

From Johnstone's Edinburgh Magazine.

THE EXPERIENCES OF RICHARD TAYLOR, ESQ., OR, LIFE IN LONDON.*

YOUNG MRS. ROBERTS'S THREE CHRISTMAS DINNERS.

CHAP. VI.—THE SHABBY-GENTEEL.

At the top a fried liver, and bacon were seen;
At the bottom was tripe, in a swinging tureen;
At the sides there were spinach and pudding made hot;
In the middle a place where the pasty—was not.
Goldsmith.

How often soever it may have been said, that we never seem ridiculous from what we are, but from what we assume to be, the saying remains as true as before; and, therefore, I once more repeat it, at the opening of this chapter. Taken in this sense, ridicule is indeed the test of truth, for nothing *true* can be in itself ridiculous. We may smile in contempt or derision of conceit and folly; or laugh in sympathy with comic or ludicrous scenes and ideas; but it is pretensions, assumption only that move our ridicule. To be above its insolent insulting inflictions we have only to be ourselves; which simple part, to the bulk of mankind, appears the most difficult to perform of any. Our social customs universally conspire to make us attempt every thing, rather than display the real character; but above all to conceal the true circumstances in which we live. We must either seem above, or—though far more rarely—below them. The very wealthy do sometimes take to

"The devil's own vice,
The pride that apes humility,"

as soon as they rise above the commoner affectations of vanity.

My young friend, Mrs. Roberts, exposed herself to *ridicule*, by the common folly of assuming to give dinners, to dress, and to live in the style of persons three times as wealthy; but, for the credit of English morality, I regret to say that she only incurred the penalty by attempting to reconcile discretion and honesty, with what, in such circumstances, was quite incompatible. Extravagance, folly, debt, gross dishonesty, in short, might have been pardoned her, where the thing was managed with *dash*, and a proper understanding of effect; but who can pardon the *shabby-genteel*; abhorred of gods, men, and charwomen.

On one of the latter turned the fortunes of Maria Roberts's *jour-de-fête*. I mentioned in the last chapter that she had, from frugality, hired one of those wondrous machines, a *maid of all work*, ignorant and stupid, at half wages,—who made up the balance by breaking china and glass, and damaging every article of furniture that fell in her way. I have frequently noticed that notable house-keeping ladies are, in general, fatalists about breaking. Mrs. Roberts, after the first three months, concluded that Jane had got through most of her breakings. "And she was so good-hearted and kind to 'baby,' (that important personage in so many small households,) and was believed so honest." "With myself, Jane, and the charwoman, and a good deal of forethought, I can manage very well," said Maria, at one of our final consultations. "I shall have every thing possible done beforehand,—the cooking will be all over before the company begin to arrive,—then I can dress in a minute; and Biddy, when she has sent in dinner, can assist Jane to wait at table. I cannot think of having one of those insolent fellows of hired footmen in the house again; and those cooks who go about, are so horridly extravagant, conceited, and dictating,—one of them, whom Mrs. Pantagus hired to assist her cook, charges 15s. a day; and must be *wined* and *portered*, and waited upon, and coaxed."

I entirely approved of dispensing with the perambulating footman, whether "of parts or figure," and also the consequential cook mentioned, whom I knew to be as troublesome and conceited as if she had taken a regular diploma from Dr. Kitchener; but how Jane and Biddy were to perform their various functions was still an affair through which I could not see my way. Of the latter I had indeed considerable suspicion all along; strenuously as I understood she had been recommended by her countrywoman, my neighbour, Mrs. Plunkett, as possessing every good quality, requisite under a kitchen roof,—had lived cook in genteel families, both in Bath and Dublin city itself; and in her first husband's time assisted the cook to the mess of the 92d regiment, though that was fifteen years ago.

My doubts threw Maria into fresh perplexity, she studied her bill of fare. "It would be taking too great a liberty to ask Mrs. James Taylor to lend me her cook for a day; but I might ask her advice—she is always so gentle and kind to me."

"But you won't ask her advice though," I put in abruptly. "My sister Anne is one of the best women that breathes; no one more amiable—more generous; but, good worthy lady, she has been happy and moderate enough never to have known any one serious domestic difficulty in her life. She has always been so perfectly at ease in money matters herself, that like many more excellent women one meets, she is rather puzzled to find out why other people are not as much at *their* ease, and have not every thing as *nice* and proper about their nurseries and their table as herself. When Roberts can allow you £600 or £800 a-year for your housekeeping, about half my brother's liberal allowance, then advise with my sister Anne. She can discourse most sensibly on economy, and wonder too how people need be so very ill off. In which sort of surprise I have seen her sensible husband join her, and with a most proper and husband-like admiration of his wife's domestic talents, declare that where families do not go on well, (with probably not the fourth of her means,) there must be bad management at bottom. And yet they are among the best people I know. To comprehend the exigencies of your position in society, or rather that of struggling professional people, the most difficult of any—is quite out of their way. Your part in life clearly ascertained, ought to be easily filled."

"I assure you to me it seems the most difficult of any. If with the fourth part of Mrs. James Taylor's income, one could do with the fourth of the beef, bread, tea, coals, candles, butter, and so forth;—but you see how it is—that would be no rule,—and what to save upon, while one must have every thing the self-same as those wealthy people—"

"Or at least some *mock imitation*, and *make-shift* thing, Maria. Well, it is a wretched system, a despicable slavery—this making one guinea do the fashionable work of three, or *seem to do*; for after all, it never gets beyond seeming. Like the foolish bird we hide our heads under the wing of our own vanity, and fancy the whole world is not seeing and laughing at us, because we have hood-winked ourselves."

I had probably pushed the conversation beyond the point of politeness; for on this subject, and with so interesting a victim before me, I could have no reserve or patience. Sometimes my heart misgave me, and I was on the point of warning Maria against the absurdities she was about to commit, and the laughter she was to draw upon herself, by her "three courses and a dessert;" but stern friendship counselled that I should let her do her worst, and endure the penalty of shame and mortification at once and for ever.

I undertook several little commissions for Maria, connected with her *fête*, and promised to come myself very

* Continued from Museum, p. 208, February, 1835.

early, to amuse Mr. Sam. Madox, a cockney bachelor of some sixty years; somewhat of a virtuoso, but more of a *gourmand*, finical and withal priggish, and known by the ladies of the many families with whom he was a dinner visiter, as "that plague old Madox, who always comes so early." Not that he came a second before the appointed hour, but to that he appeared punctual as the hand of his watch.

I did not appear before my services were required. Great as are the mysterious powers of ubiquity possessed by a maid-of-all work, it is still just possible that the most thorough-bred of the corps cannot overtake every thing. When I arrived, all was, as is said, at sixes and sevens. The parlour fire was still unlit; the confusion in the kitchen might have been, as the charwoman who made it said, "stirred with a stick." Maria, in a morning gown and apron, not over clean of course, and her ebon tresses in papillotes, was hushing "baby," who squalled, as if on purpose, ten times louder than ever he had squalled before,—and casting looks of distraction and despair on Biddy, the regular charwoman and brevet cook. To me the latter was the most amusing person of the group. Maria watched her as a clever sensitive patient may an ignorant surgeon, certain that all was going wrong, that some dreadful mischief was impending, but overawed by the dignity of the profession, and afraid to interfere. Mrs. Roberts was conscious that, though perfectly able to judge of results, she still knew little or nothing of preliminary culinary processes; and was, in many cases, an entire stranger to the mode by which particular effects were to be produced. It was not difficult to perceive that Biddy, if she had ever possessed the requisite skill, had let her right hand forget its cunning. Like all other persons in office who do not know their own business, she required a deputy.

"Sorrow be on you, girl, won't you give me the cullinder; and the tureen, as you see, between my own hands?" Mrs. Roberts flew with the desired utensil. "Och, excuse me—is it yourself, ma'am—where the *diaoul* has that creature Jane put the dish-cloth, which was in my own hands this minute? In troth, then, sir," continued she, looking at me with one of her broadest grins, "if you don't have that, we'll be thinking of pinning it to your tails. But just mention, my lady, now, what sauce you would like for the roast bullock's heart, that's to relave the soused rabbits, and onion sauce."

"Oh, not the rabbits," cried Maria; "surely you know better—you can't forget it is the *Hessian ragout*, that the mock roast hare relieves"—

"Well, never mind—the one or the other it is, any way. Sure, I saw it oftener than there's teeth in my jaws, both ways; with the mess of the 92d it was always the t'other way;—but your ladyship may take your own way for all that."

"Think how time flies, my good woman," cried the anxious hostess—"almost four. Will you take another draught of beer?—and then the pheasant—not singed yet. Mrs. James Taylor has sent me such a beautiful pheasant"——

"We'll be none the worse of the liquor, any way, ma'am. And is not he an illigant love of a bird, now, Mr. Taylor,—many is the likes of him I seen in my own country—only a thought larger.—(*Drinks*)—That's no bad beer. Cox's house is one of the best in Lunnon, both for measure and quality. But would you like his head twisted this way, ma'am, or that way, ma'am? He is a prince of a bird. He'll grace your table, ma'am!"

"So I hope. It was so good of Mrs. Taylor to send me this game—I never would have gone to this bird's price. But dear me, cook, truss the head any way:—really, my good woman, this is no time for conversation, pleasantly as you talk—any way with his head—you know best about that."

"*I shud*"—was pronounced with emphatic brevity; and the neck of the unhappy biped was twisted every way but that which fashion or custom prescribes and calls the way. Maria guessed as much; and I admired the strong good sense and presence of mind which prevented her from fretting, or standing on trifles in such an emergency. She was like Napoleon giving his commands to the surgeon accoucheur of Marie Louise. "Treat my golden pheasant as if it were but an ordinary barn-door fowl," Mrs. Roberts's silence seemed to say. "And never fear," replied Biddy, "I'll have him in in pudding-time, I warrant me,—the pisant, and the sowles, ma'am, first—An't that it?"

"O dear, no, no,"—cried Maria, now thoroughly vexed. "The pheasant—the game is for the third course."

"The third course!—Sure I have seen him in the first, when a dony bird like that, both in Mi Lady Cark's, and Mr. Sergeant Saurin's too."

"But in England—Oh Biddy!—Well, you Jane, you will surely remember when the pheasant is to be sent in. Here's the bill of fare."

Again perverse "baby" squalled out, and drowned all our voices.

"Such a scene, Mr. Taylor—will you, pray, step into the parlour?—Jane has lit the fire now again I hope. Oh baby, cruel baby! if you knew what your poor mother has to undergo to-day, you would surely be a better boy. Gracious! that's old Madox's knock!"

This luckily proved a false alarm; "baby," by good fortune, had now exhausted himself in squalling, and fell asleep. Maria had five minutes to dress, but how, she whispered, could she leave that fearful Biddy.

"Make yourself asy, ma'am: trust to myself, and mind you your good company. First, the *sowles*, and the *Hissian ragout*;—but there's no good any way of letting this drop of beer die a natural death in the mug. A merry meeting of friends to you, my lady! and trust your dinner to myself, and I'll do it handsome and genteel, as Mr. Taylor there will tell you."

The maid, by power of bellows, had by this time forced a tardy reluctant fire in the parlour, and sent clouds of ashes over all the neatly laid-out table, the labours of the indefatigable Maria. Willing to be useful, aware that the mode of a service may often double its value, and having no fitter means, I dusted all round and over with my veritably *clean* silk handkerchief—and sagaciously comprehending that a bundle of half, or one third burnt wax-lights, such as thrifty housewives buy cheap in London, were meant to be stuck in the candlesticks, but forgotten by her of all-work, I also performed this other duty. And now Madox fairly knocked, and Maria flew down, adorned, from her attic chamber. Miss Kelly never shifted her costume more rapidly. We were both in the passage on our way to the drawing-room; but the final orders were to be given to panting Jane, who was about half dressed. "Now, for any sake, Jane, don't forget what I have driven into you! Don't affront me by your stupidity:—the thickened butter—and to have the coffee hot—and to heat the cream—and the drawing-room fire; and oh, do try to keep 'baby' quiet, if he awake; and don't let him pull his nice cap. But don't put it on till I ring for him—and above all, be sure you don't let Biddy roar so loud, or touch more beer—you know what a beast she makes of herself—she will spoil the dinner, and break the things. O! that plague old Madox! How he knocks!"

"Yes mar'am—no mar'am," followed at intervals from the bewildered maid of all-work, whose replies were mechanically measured by time; certainly not dictated by sense—for true it was, as Maria said,

"Now, Jane, you don't know a word I have been saying to you. Oh me!"

Maria had not composed her looks, or drawn on her gloves, when Madox was upon us in the blue drawing-room.

Whether the devil tempted him or not, I cannot tell, but he talked away at no allowance of the excellence of the London markets, always in this month of February. Fish so good—salmon, prime—game—wild ducks—teal. It was the very season for the London carnival. Mrs. Pantague sailed in imperially—spread abroad in satin, capped, and jewelled; and after the ordinary compliments, the discourse flowed in the former channel. She had been ordering things that morning, though she rarely marketed herself. Mrs. Pantague was one of those many English people, who apply the possessive pronoun on all possible occasions. "*My* fishmonger," "*My* confectioner." One might have thought she held the whole of each poor man in sole property. *My* cook is nothing.

"My cook is so exquisite a judge, that I rarely look at any thing. I can so fully rely upon *my* butcher. How do you manage, my dear Mrs. Roberts?"

"The London markets are splendidly filled at present, ma'am," said Plague Madox to the great lady. "Few London sights equal to them after all, ma'am."

"And so they are, Mr. Madox,—Paris, Brussels. I don't say much about Vienna, though my friend, Lady Danvers, who lived long there, when his lordship was connected with the embassy, has often told me that Vienna is in *bonne chere* a superb city; but after all, Mr. Madox, as you say, commend me to London markets. Cookery may be better understood in Paris. You have been in Paris, I conclude, Mr. Madox,—often?"—Madox bowed. "But for provisions; the sterling English staple, as Sir John says, London may challenge the world,—fish, flesh, or fowl."

"Right, madam, and so it may. Old English roast beef, the growth of every county. Banstead mutton, Essex veal, Dorking fowls, Norfolk turkeys, Lincolnshire geese. Hey, Mr. Roberts, got before you." Maria bit her lips over the alimentary catalogue of February, while Roberts saluted the company.

I cannot go into the mortifying details of this *three courses, and a dessert.* The bawling, and mishaps of Biddy, the blunders of distracted Jane, the agony of poor Mrs. Roberts, and the distant squalling of "baby." Even *I* could not have anticipated a chain of such mortifying accidents, though they were all quite natural.

The awkwardness of the guests who possessed politeness and delicacy, and the ill-suppressed grumbling of the ruder natures, disappointed in that great affair, a dinner, was nothing to the airs of insolent disgust, with which Mrs. Pantague pushed away plate after plate—touched, yet untouched. I must acknowledge that the *soles* were not of the freshest, though they might be correspondingly *cheap*, nor were they the best cooked. Mrs. Pantague, in pure malice, I am certain, required to have the dish named *Hessian ragout*, analysed by Madox.

"Bullocks' cheek stew! that is a ragout I am not acquainted with:—not any, thank you: indeed I have dined." The great lady leant back in her chair with a look of haughty yet piteous resignation to her fate.

"There's a pheasant coming," faltered poor Mrs. Roberts. It was in her dinner like the single great lord among a vain man's acquaintance.

"I will trouble you, Mrs. Roberts," said my hearty brother James. "I did not know the dish under its fine name. You remember, Dick, how we used to lay our ears in this stew at Nurse Wilks's on Sundays. Never was turtle so glorious."

This was scarcely a rally for Maria. At another time it would have been mortification. Plague Madox now ventured upon "Just one-half spoonful of the ragout—thick;" and after cautiously reconnoitring the table, had the dose repeated. This looked better; and

> By and by, the second course
> Came lagging like a distanced horse.

Bullocks' heart stuffed and roasted has its admirers even among *gourmands:* but then it must be *roasted*, sanguinary as English eaters are. The condition was, therefore, a capital disappointment to more than one gentleman, and worse to Mrs. Roberts, compelled to say, "take this away," though it had been her main reliance; a dish that both Mr. James Taylor and Mr. Madox particularly admired—and rarely saw. A young puppy, one of Mrs Roberts's friends, who had got, by chance or accident, a copy of verses into a magazine, and set up literary pretensions accordingly, regaled us at our side of the table with the story of "De Coucy's Heart," and the "Basil Pot," till the ladies began to look pale and sick. Across the table there was a dialogue on cannibalism and the New Zealanders, which, so far as it was heard, did not mend our health nor quicken our appetites; but all this was nothing to the tremendous crash which came at once above, below, and around us!—and the exclamation,

"Och diaoul! come quick jewel, Mr. Richard. Did not the kitchen chimney go on fire—we are all in a blaze." And Biddy, like ten furies, was in the midst of us.

The ladies huddled together and screamed, and would have run into the street—if not prevented by main force, backed by my speedy assurance that this was a false alarm—merely a blaze of overturned grease as their noses might inform them. Maria, forgetting every thing but a mother's feelings, flew to find her child, who appeared among us after all in his night-cap, but yet helped wonderfully to restore tranquillity, as all the women were bound in turns to seize and praise him. Things looked better again. The *sweets* previously prepared by poor Maria, with great pains and care, and want of sleep, and a wonderful effort for a first, got the length of being "damned with faint praise" by the lady-judges, though Mrs. Pantague did recommend Mrs. Roberts to try "My confectioner only for once. He was, to be sure, an unconscionable wretch in his prices—but exquisite in taste. His *Vanilla Cream* was allowed to be unequalled in London. It was sent to the Pavilion, and to ——— House, when nothing else of his was taken. It was indeed a great favour to procure it." What was the final catastrophe of the pheasant I cannot to this day tell, but he never appeared; and Plague Madox indemnified himself with *blue* cheese and some tolerable bottled porter. The port—it was called clarety-port—something that was to unite *cheaply* the *body* of Portugal with the spirit of France, he had sipped—eyed between him and the candle—and pulled in another decanter. I suppose the sherry, or rather Cape Madeira, he hit upon, was a leap out of the frying-pan into the fire. He actually made faces.

"Who is your wine-merchant, Roberts," cried loud Mr. Pantague, the stock broker, from where he sat, by the elbow of the miserable hostess, who had now lost all self-possession and almost temper, and who afterwards told me that it was with great difficulty she kept from crying. Pantague was also smacking critically, and holding his glass between him and the candle. Roberts looked as simple as his wife and more vexed. Either no current name of value in the wine-trade occurred to him, or he might not like to lie. He had, after a moment's pause, the forethought, the true John Bull spirit and manliness to say, "The very little wine I use, Mr. Pantague, I buy where I find it best and *cheapest.*"

"O, right—quite right," cried Mr. Pantague, and tossed off his glass. This was the most hopeful feature of the night. Could I have caught the eyes of the speaker mine would have thanked him.

"Very fair port, this," said Mr. James Taylor, the rich thriving solicitor. Plague Madox drew his red wine glass to him again, and filled it once more. "New; but very good: what say you, Dick?—My brother is one of the best judges of wines now in London. You need not

gainsay it now, Dick: your Italian residence, and early pursuits, have made you so; but I believe you refer it to your unsophisticated palate."

I rose 100 per cent. with the company in one second; and resolved to improve my sudden accession of vinous fame to the benefit of Maria Roberts.

"There ought to be *wine* in this house; ladies' wine, at least," I said, nodding, knowingly, to Mrs. Roberts, "if the lady of it would only appoint me her butler for the night."

"With the utmost pleasure, Mr. Taylor; but you know"——

"What, I know—give me your key." Maria stared at me. There was method in my madness. I returned in five minutes, or rather more, and solemnly placed a couple of pint bottles upon the table. Jane furnished me with fresh glasses.

"I am not going to accuse our hostess of not bestowing the very best wine she has upon her friends; but I am afraid I must accuse her of not having taste enough in wine to know the value of her own treasures."

"Nay, if I had thought that half as admired as ——"

"Give me leave, ma'am. We need not mystify the matter. This is two of six bottles—but we must not rob Mrs. Roberts of more than one—this little cobwebed fellow—that came as a present from the Bishop of ——'s cellars; sent by his lady to her god-daughter, our amiable hostess, before her late confinement. The late brother of the bishop was for some time governor at the Cape. Give me your opinion, ladies, of this *coddling* wine, that you send in presents to favourites." I had said enough for a lady of such quick tact as Mrs. Pantague.

"Delicious Constantia!" was her affectedly rapturous exclamation. "'Tis not every where one meets with the like of this. And the bishop's lady, whom I have seen at Brighton, is your godmother, Mrs. Roberts?"

"I have that honour."

"Exquisite wine! The veritable nectar of the gods, Mr. Richard, must be Constantia. Nay, nay; this must be kept for a *bonne bouche*—husbanded—a fourth of a glass if you please." I had no wish to hazard a second trial, having come off so well upon the first.

"The *bouquet*—the delicious fragrance of this wine, is its charm to me," said our young poet. "You must be sensible of it, Mr. Taylor."

"I'll be hanged if I smell any thing save the burning grease the cook had nearly set the chimney on fire with," replied my brother. "She seems, by the way, on very happy terms of familiarity with you, Dick; and quite a character in your way. I believe you know all the Irish charwomen in London."

All the ladies tasted the "delicious Constantia," while Maria, trying to look frowningly, really looked half comic, half amused, at my impudent fraud. Several of the fair judges pronounced it very fine. My sister, Anne, said it was very sweet and *nice* indeed—but of wine she was no judge; and Miss Claves, a very lively young lady, vowed it was so like milk punch, which was quite a charming thing, that she could not tell the difference for her life.

"O, the *green* taste of *raw* girls, Mr. Richard!" whispered Mrs. Pantague. "How many good things in life are thrown away upon them! Your niece, Charlotte, has really then positively refused the old banker—her ultimatum given in? But will Mrs. Roberts never move, think you? Really, to be frank, I long for a cup of even cold wish-washy coffee after this (*a shrug*) absurd *visceral* repast. I wish some friend would give the poor young woman a hint: could not you, Mr. Richard?" She looked at her watch.

I vowed in my indignant heart that Maria should, in hearing every word of this, reap the bitter fruit of her own vain toils. But I did not need to be so severe in my lesson.

Before the poet and myself reached the drawing-room, half the ladies had disappeared. From below, Plague Madox, my brother, and all the old stagers, went off without looking near us. The clarety-port could not have been very good, after all, I suspect. Madox swore that either the wine or the fare had deranged him sadly; for three days baffled all *peptic precepts*—lost him two *good* dinner parties—and raised doubts whether he would ever accept an invitation from Roberts, or any man who kept no regular cook, in his life again, where every thing was, he said, "More provoking and worse than another. Pity the poor fellow with such a wife!"

In the mean time I have forgotten to tell, that when very late, George Roberts, and a few young men, who, in spite of every disaster, stood by him and the bottle, staggered up stairs. I was now alone in the drawing-room. The young ladies, after yawning, hour after hour, in the vain hope of relief from below; after examining and re-examining Maria's store of nick-nacks, and hopelessly endeavouring to extract music and young gentlemen from the broken-stringed cabinet piano-forte, had all taken wing while Maria was gone to put "baby" to sleep.

Roberts was half tipsy, half chagrined, and I perceived in a fair way of getting into very bad temper. This was his day of festival, the christening *fête* of his first-born, and there was no joy, no sociality, no pleasure, no amusement. He had promised his young friends, his wife's music, female society, a dance—and there remained for them an empty disordered room, where "Queer Mr. Richard Taylor" kept watch over two blinking wax-candle ends and a few smouldering cinders.

"Where are all the ladies—where is Maria?" was said hurriedly. "Where is Mrs. Roberts?" in a more imperative, and husband-like tone. Echo might answer *where*, if she chose, but I was dumb. Roberts jerked the blue bell-rope, and down it came, and up came panting Jane.

"Where is your mistress?"

"Putting 'baby' to sleep, sir."

It would be treason against nature to suppose that Roberts could really have said "Deuce take 'baby;'" but Jane, who looked perfectly aghast, and, indeed, in utter horror, certainly believed those shocking, unnatural words, were spoken; and had they even been, they would have meant nothing serious—a proof that a man must not always be judged by his rash expressions.

"By Jove!" was the next exclamation, "if we cannot have amusement above stairs, we shall have jollity below. Here you, Biddy, or whatever they call you"——

"Biddy Duigenan, an' plase your honour—so christened by Father ——."

"Get us a dry devil, or a broiled bone, or something peppery and famous."

"Och, then! devil a bone with a thread on it, within the dour of ye. The mistress chooses her mate without bones. She's a mighty frugal, managing young cratur."

This conversation passed, aloud, between the door of the drawing-room and the bottom of the stairs. The young men roared in full chorus; and Mr. Sullivan the Templar instantly challenged a countrywomen in Biddy, who was heard laughing jollily below, crying to Jane "Faix, but it does myself good to see the gentlemen getting hearty and merry at last. One might thought their feast a *Keepsin*,—no loock till the bits of misses, the craturs, go off."

"By the powers! if we can't get meat we shall have drink, boys," cried Mr. George Roberts again in a most uproarious and savage humour, something affected too by the satirical commentary made by one of his friends on "a lady choosing her *mate* without bones," which as a husband of some eighteen months, and consequently still very touchy on the score of *hen-pecking*, he fancied it mightily concerned his honour and masterhood to resent.

"Ay, *bones* and blood, and spirit too, by Jove, Maria! Mrs. Roberts! Madam, I say, come down stairs! You shall see, gentlemen, who is master in this house—if all the wives in Christendom"—But it is idle to repeat the ravings of an intoxicated man. I knew Maria would have the delicacy and sense not to come down stairs; and Sullivan, by far the soberest of the party, having brought our host to order, and promised me to take care of the party, I stole away. Jane, as I afterwards learned, a simple country girl, immediately became so frightened, that she crept up to her mistress, reporting "that the gentlemen were tipsy and riotous, and that one of them had pulled her on the stairs. Master was tramping up and down rummaging all the cupboards for spirits; and Biddy was worse than all the rest." Maria, a stranger to every species of excess, a girl transferred from school to her own house, became more nervous than Jane; and as the noise of song and revelry,

Of tipsy dance and jollity,

rose louder and louder from the polluted blue-room, constituted into a kind of *Free-and-Easy* club, the women bolted themselves in. Jane, after her hard day's work, soon fell asleep sitting on the floor; and it was not till the watchmen, attracted by the riot within, had rung repeatedly, and that the young men sallied out "to thrash the Charleys," when a general *melee* ensued, that she was awoke by the shaking and suppressed cries of her mistress, as the whole party below, Biddy inclusive, were carried off by the guardians of the night, and safely lodged! How Maria got through the dreadful night I cannot tell; but I lost no time, after receiving her early message, in repairing to the office. Mr. Roberts and his friends were already liberated without examination, and had slunk away, bribing Biddy to silence with sundry shillings and half-crowns.

Roberts looked foolish enough when I found him at home, sitting amid the *debris* of the blue-room, writing a note of apology to Joseph Greene for the nocturnal disturbance; but he still seemed to believe that the whole scene arose from Maria's absurd management, and the air of pretension and *shabby gentility* of her entertainment, which had made them both ridiculous; the discomfort of every thing; and, above all, "the impudence of that Irish hag, and the insolence of that Mrs. Pantague." He did, however, condescend to apologise to his wife for the outrage of which he had subsequently been guilty; and his boon compeers of the night, one and all afterwards declared, that they never durst look Mrs. Roberts in the face again.

This was not the end of the affair. Roberts was forgiven by his wife, who, in her ignorance of *life*, fancied his conduct far more grievous and degrading than he was disposed to feel it. But there was another reckoning to adjust. By some means my brother got intelligence of the manner in which Roberts's *fete* had ended. "A married man,—in his own house,—it is too bad. I fear this is not the first of it," James said to me. "For some weeks, Richard, I have wished to consult you about this. Do you know Roberts is short of his cash?"

Awful charge against a confidential clerk! I guessed how much it imported.

"To what extent?"

"No great extent; but the thing is so wrong, so *unbusiness-like*." This is another most significant phrase. "About 60*l.* or 70*l.*—and perhaps he may have some claim against me; but I don't like the look of it. Such arrears are so *unbusiness-like*. I fear he is extravagant—getting dissipated"——

"Only foolish—or something of that sort," was my careless reply;—"but he will mend, I dare say. What meanwhile have you done?"

"Ordered him to balance his cash, and pay up by Friday at farthest."

"Quite right,"

I instantly took my way to the Row. Maria was in the blue drawing-room; now in its gilding and draperies of all hues soiled and tawdry,—the ornaments smoked and tarnished; the chairs and tables crazy or fractured, and the purple and gold purse faded from its original splendour, as I remarked on seeing it on the table.

"Alas, it has acquired a worse fault," Maria said, while she shook it to display its emptiness, smiling and sighing.

"A sieve-like quality—the faculty of running out faster than Roberts pours in"——

"Something very like that, I confess."

"Do you pardon my frankness, Mrs. Roberts, and give me leave to be sincere with you?"

"I do, I do, and thank you most sincerely.—With our limited income"——(*hesitation.*)

"All your stitching and pulling cannot keep fortune in at heels, and make both ends meet."

"You have guessed it, Mr. Richard.—Were it not for my poor child,—and poor Roberts too,—I would certainly endeavour to procure a situation as a governess,—and Roberts, he might go into lodgings again; since it seems I cannot, with all my skill and economy, manage that we should live on our income,—and it is worse than all that with us! Oh, I assure you it has almost broken my heart!—Mr. Roberts is short of Mr. Taylor's cash. It is shocking!—his integrity may be doubted; and he was in fearful temper this morning. I dread his coming back." Maria could no longer restrain her tears. I was gratified by her confidence in me, pleased that Roberts had at once told her the circumstance so important to them both; but she had another motive for confiding in me. "I have a great favour to beg of you; I have a few trinkets," she said; "presents and gifts of one kind or another. It would be such a kindness in you to dispose of them for me, that I may help Roberts so far. There is the piano too, and other *useless* things"——she looked round the room—"they would not bring much, but every thing helps."

I knew, for I had seen it, that Maria had at least the full value for her *suit* of pearls and other ornaments; but principle and generous affection were far more powerful than vanity. Roberts had peremptorily refused to dispose of her trinkets; he was even affronted by the proposal, and she depended on me, and urged me; and with the case in my pocket I left her, and encountered her husband at the corner of the street.

"You have been calling for your favourite, Mrs. Greene," said Roberts.

"No; I have spent the last hour with my more interesting favourite, Mrs. Roberts."

Mr. Roberts looked confused and uneasy. He remembered in what humour he had left his wife in the morning. "Then, sir, you have spent your time with a very silly, incorrigible woman; but this, I suppose, is no news to you; you see how all reason and advice are thrown away upon her."

These were high airs, indeed, for Mr. George to give himself! he who deserved at least a full half share of the common blame.

"Pardon me if I see no such thing; but quite the reverse. To me, Mrs. Roberts appears an uncommonly clever young woman,—generous, candid, and well-principled,—and most anxious to do her duty so far as she understands it. All she requires is, forbearance, kindness, and gentle guidance, till her rapidly increasing knowledge is matured into experience."

The honeymoon was long past, and Roberts, as I have said, in the crisis when young husbands are the most susceptible of jealousy for their many privileges and powers; yet was Roberts much better pleased with my opinion of his wife, than if it had coincided with his own. I took his arm and we walked back towards his

house. One of the peculiar blessings of an old bachelor and slender annuitant like myself, is the power of saying, when the salvation of a friend demands frankness, things that it would frighten a sensible man with a wife and six small children even to dream of. Some of these startling things I now whispered in the ear of George Roberts and his wife. They were young, healthy, virtuous, sincerely attached to each other, better endowed with world's goods than on the average are four-fifths of their fellow-citizens—why should they not be happy? "How great a blessing were it," said George sensibly, "if young women were trained to the *utilities*, and *comforts*, and *solidities* like Rachel Greene, and less to the *refinements* of life like Maria."

Now though Maria was more my favourite at present from compassionate interest, and though custom had stamped many of her little pretty ways and affectations with the name of refinement, was she in reality more truly refined, farther removed from the vulgarities and assumptions of affectation, than Rachel Greene, the amiable quakeress, with whom she was contrasted?

"If Maria had been taught a little plain house-keeping, instead of so much music," continued sensible George, "how much better for us all now."

Yet Maria had not been taught so *very* much music. She had not, at least, acquired more than any girl might easily learn between seven and seventeen, and practice while it was desirable, without interfering, in the least, with her domestic duties, where music is kept as an elegant recreation, not held as a means of coquetry and display.

"If we could be carded through each other," said Maria, half laughing.

"Ay, Rachel's substance, with Maria's gloss and colour, would be a first-rate fabric. I think I see it in my fancy-loom. I shall never despair of *woman* in the general, nor Maria in particular."

I took my leave, inviting myself back to tea, at which time, in a regular family-council, I deposited the price of Maria's pearls in her husband's hands. He was half offended, half vexed. I have ever noted that men have much less true magnanimity and simple greatness, on such occasions, than women. He was at first ashamed and angry at being obliged to his own wife; but better feelings prevailed. We had a long frank, and therefore a most satisfactory explanation. The *limited income* was the first head of discourse. I heard George expatiate on that with some impatience. "Your income is, at least, more, by three times, than the richest rector in England affords to his drudge curate,—twice or near three times more than the income of two thirds of our half-pay officers, with considerable perquisites in addition."

"These have undone me," said Roberts. "Trusting to these, I forbore to be so implicit with my wife as I ought to have been. I trusted to contingencies. I did not choose to seem churlish and sordid, by perpetual interference with her arrangements, for I read all her anxiety to do right."

"Fluctuating income and sanguine calculation have ruined thousands," was my *sensible*, though rather commonplace rejoinder.

George Roberts needed not my direction, now that his good sense was roused. His wife's generous sacrifice, for so he was pleased to call it, though neither Maria nor myself would allow the phrase, and the sale of nearly all the moveables of the *blue room*, enabled him next day to clear scores with my kind brother, Mr. James Taylor, who now said there was no such pressing haste, as Mr. Roberts, *with his first year's outlay*, might need a little indulgence.

On the same day Maria could say she at last had a house of her own to *live in*, almost as comfortable as Rachel Greene's.

Jane and she had indeed worked hard to have all right before Roberts came home, to dine in comfort; bringing myself along with him, after the completion of our blue sale, to share the very small but sufficient juicy stew of meat with vegetables and apple-pasty, which formed the repast. After dinner, while she filled my tall Teniers-looking glass with amber-coloured creaming Scotch ale, Maria said, with a more elevated spirit than I had ever seen her assume,—with an air of noble simplicity. "Drink to the happy woman, my excellent friend, whose husband owes no man a shilling,—and to her who resolves that, so far as depends upon her economy and management, he never shall."

I never accepted pledge with more sincere pleasure in all my life.

"But what will Mrs. Pantague say?" said Roberts, laughing.

"Exquisite Constantia!" mimicked Maria, archly, as she sipped the cream off her ale; and the merriest young natural laugh rung out that I had ever heard her indulge. My fears for the peace of the Roberts family—for their prosperity and happiness, were laid for ever. The spell of fashion was broken—the demon, Mrs. Pantague, exorcised; and Maria was one more proof that a well principled character, an intelligent and active mind, when its energy is roused, will be found in every circumstance equal to the common duties of life. She became an excellent housewife.

There were few of the many houses at which "I dropt in" where the fireside now looked so snug and sunny as that of Mrs. Roberts. Even "Baby," my old antipathy, now well managed and healthy, had grown a fat, good-humoured, smiling, *conversable* fellow. Maria once again ventured to take in the newspapers at the usual expense, and never grudged to pay for as much reading as Roberts or myself chose to give her at what she called the mother's hours of work; from seven to ten in the evening.

Towards the end of the year I was again consulted by my sagacious brother, James.

"What do you think, Dick? that old fox, Martin of Chancery Lane, is trying to steal George Roberts from me—the man who knows all my affairs better than myself—the boy I brought up, whom I trust as my right hand. Don't you think, Dick, I might do worse, now that I am growing lazy, and fond of the farm, than give so steady a fellow as Roberts some sort of share?"

"There was an obstacle about his arrears," was my sly reply, "was there not? He either overdrew, or was *behind in his cash*."

Mr. James Taylor could remember nothing of it; and there was no affectation, much less insincerity, in his oblivion on those points,—which inclines me to think that when statesmen sometimes totally forget their early professions, they may not be so hypocritical as people imagine.

"Is there any thing you think Mrs. Roberts would like at this Christmas season? You are a great friend of hers, I find, and she has considerable influence with Roberts."

"My brother wished to show you some substantial mark of his good-will," said I to Maria, when two hours afterwards I went to her house. "I have counseled him to assist Roberts in purchasing the lease of the house next your friend Rachel Greene's new abode. He has money to lend at a very low rate of interest; and as you often truly tell me, rent is such an *eat-em*, (item,) as the Scotch say, in a fixed income. On your own personal account, instead of *gaud* or *toy*, I accepted only of this."

I called in the boy who bore the guitar I had chosen and purchased for her as my brother's gift. Maria was not too proud to feel warmly, to seem highly gratified;

and in six weeks afterwards I partook of her THIRD CHRISTMAS DINNER, in her new house.

"I am afraid to venture," said she beforehand, "strong is the recollection of all my mortifications, and disgraces, and miserable failure of last year; but with the treasure you have given me in poor Sally Owen, who is the most neat, industrious, and excellent servant-of-all-work I have ever seen, I think I must venture, since Roberts insists we can now, by better economy and sense, afford to see our *real* friends, and a pleasant acquaintance too. But I grieve to tease Sally with a party, who still pines so about her little girl, and that *scamp* of a husband of hers."

"The sooner she is roused from these recollections the better."

I could think with no patience of Mr. Hardy, the marvellous boot-maker, who, because he could earn very great wages, contented himself with half; wasted that pittance in riot; starved, *beat*, broke the heart of his uncomplaining wife; whom I could sometimes have beaten also in anger of her foolish forbearance, and really tender but senseless attachment to this worthless fellow, who had, I was assured by her, "so good and kind a heart when he kept sober."

I cannot comprehend the infatuation of women. After the boot-maker had behaved as ill as mechanic or man could do, squandered all their little furniture, and the fruits of Sally's early savings, he ran off in a drunken frolic to Liverpool. She was compelled, to avoid starvation, to take service, and let her child go to the work-house, I thought myself fortunate for both their sakes, in recommending her to Mrs. Roberts. For ten months the boot-maker was not once heard of, and Sally looked a forlorn Penelope. He had gone to Dublin, and thence to Belfast, where we first heard of him in the hospital ill of typhus. He should have had my leave to take time to recover. But what an unnatural monster did my fair friends, Mrs. Roberts, Rachel Greene, and Nurse Wilks imagine me, when I suggested the propriety of letting Mr. Hardy quietly lay his restless bones in Ireland, without disturbing his wife.

Blessings upon their kind, simple hearts!

"He spoke to them who never had a *husband*!"

Would I keep Sally from her duty!

Poor men's wives have often very hard conjugal duties compared with those of the ladies of the rich. Sally tied up her few remaining clothes, with my recommendatory letter to Mrs. Lyndsay Boyle, in a bundle, kissed her child, and trudged away to walk a couple of stages ere she took the top of the Liverpool coach, on her way to her sick husband. It was six weeks before she returned to us, thin as a greyhound, much dejected, and looking twenty years older; but all the women concerned assured me Sally had done her duty; for the extraordinary boot-maker said on his death-bed that he sincerely repented of his unkindness; and he sent his blessing to his child, whom he solemnly charged Sally to bring up in the fear of God.

Excellent consistent man! for his sake Sally resolved she never would make a second choice. With her wages, and a little help, she could now take her child from the work-house, and send it to the country to nurse; and as soon as it was five years old, Mrs. Roberts determined to fetch the little girl home to be first a comfort, and then a help to its subdued mother. This prospect gave a zeal and warmth to poor Sally's services which no other motive could have furnished. She was permitted to go to see her child on a Sunday. Poor Sally Owen could not now have been known for the blithe, light-hearted, ruddy Welsh girl, who went to sing like a bird all day at her work. She had plenty of work still; but her mistress was kind and sisterly, and her little girl Sally had something dearly to love: so that upon the whole, I believe, the widow of the accomplished boot-maker,—who starved his family, and killed himself because he could make double wages when he chose to keep sober, (I do confess a spite at the man,) was upon the whole in fully as felicitous circumstances as ever his wife had been;—though I durst not say so.

From Mrs. Roberts' THIRD CHRISTMAS DINNER, I walked home part of the way with my brother, Mr. Sullivan, and Plague Madox, whom I saw to the Haymarket near where he lodged.

"Very pleasant party," said the old buck, for the third time, as we stood to take leave. "Remarkably well-dressed, well-served dinner; so good, and *enough* only—no John Bull load. She is an excellent valuable creature that Sally Owen. I suppose the mutton was Welsh. Really Roberts's wife looks a hundred per cent. better since she plumped out a little, and dressed in that neat plain way. Last year—I have not seen her since—she looked so fretful, tawdry, and haggard, that upon my honour I was concerned for Roberts. I don't think I would have visited them again, if Mrs. James had not hinted at decided improvement. I am to dine at your brother's charming house to-morrow. Every thing delightful there, though I don't think the young ladies are better guitarists than Mrs. Roberts."

"The difference being that Mrs. Roberts is a tolerable performer on that charming unpretending instrument, which links the romance of sunny lands to a quiet English fireside, while my nieces"———

"Charming girls!" But the wind set in most cuttingly. "Eliza reminds me most of Abingdon of any lady I know." This was unintelligibly breathed through ten folds of a Barcelona handkerchief, and Madox went off, hating the east wind as much as he loved a pleasant dinner party, with all its accompaniments—guitar music included.

I could not forbear calling to congratulate Mrs. Roberts next day. "Always at home to you, sir," said smiling Sally Owen to me, "though mistress has been so busy putting things to rights."

"Quite done now though," cried Maria, opening the parlour door; "I know your knock so well."

It is pleasant to have friends, particularly female friends, that knows one's knock. I like to hear it.

"Your triumph is complete, Mrs. Roberts!" I said. "Plague Madox has pronounced you perfect! but you need never hope for the Pantague suffrage."

Maria was still laughing heartily, when Sally brought in a packet. I knew its contents before it was opened, for I had seen Madox purchase that morning, at an auction, a whole lot of cheap guitar music. No man in London could exchange this sort of notes for solid dinners more knowingly than my old acquaintance. I had foreseen that Mrs. Roberts, now fairly ranked among the comfortable dinner-giving women, was to have her share of the purchase.

"Confirmation strong!" cried Maria, laughingly holding out to me the printed sheet of music, inscribed in his best hand "With Mr. Madox's compliments to Mrs. George Roberts." "But in spite of this polite note, and *Zoras earrings* to boot," said Maria, "a charming bribe, no doubt, I do think a young couple like Roberts and myself, beginning life, may find, if we beat up diligently the highways and hedges, more suitable or desirable family guests than the Plague Madoxes of society. I have imbibed your own notions and Rachel Greene's of that in which true hospitality consists. They exclude the regular *diners-out*."

I must some day write the biography of my friend, Plague Madox; who had dined out for nearly thirty years upon the reputation of a farce, damned forty years ago, and three anecdotes of Sheridan; and this, though the ladies where he visited hated him with one accord.

From Fraser's Magazine.

LOVE'S LEGACY.

BY THE ETTRICK SHEPHERD.

Canto Third.

Days, weeks, and months, flew on apace
Ere I could leave that fatal place,
While dearer every day it grew
By fond and thrilling interview;
Till, quite o'erpowered with delight
At beauty so intensely bright,
And gentleness so kind and sweet,
I laid my being at her feet—
Beseeching her the boon to lift;
For without her it was no gift.
At this, no frown her face o'erspread;
Although the pale rose and the red
Strove each the other to outvie
In beauty's glow alternately.
Though on my couch I still reclined,
All was adjusted to my mind;
She owned not love, nor yet offence,
Nor even a formal preference;
But gave her hand without dismay,
And turned her lovely face away.
With gratitude quite overpress'd,
I held that hand unto my breast,
And kiss'd the pledge so fair and soft—
I may not, cannot tell how oft.
From that time forth I looked upon
That peerless maiden as my own;
And wondering how the thing might be,
I oft shed tears of ecstacy,
That thus of beauty feminine
The flower of all the world was mine!
And oft I bless'd with fervent mind
The Father of the human kind,
For having made one form and face
So far surpassing all our race,
Yet that fair form so far outdone
By the sweet soul that them did won—
The brightest gem below the sun;
And gave that wonder of the earth
To one so far below her worth.
Although my passion was sincere,
It was too much for man to bear;
Love, admiration, and esteem,
Struggled for mastery. And to dream
Of living in that fervid frame,
In outrage would have been the same
As a resolve to live in flame.
Back to my father's home I sped—
Kept to my chamber and my bed—
Made songs of love and sonnets high,
Enough to make a Christian cry:
And then I dreamed such living dreams
Of roseate bowers and silver streams—
They were so luscious, that I vow
I'm quite ashamed to tell them now.
I wandered dell and lonely lea,
And my dear maiden still with me;
I saw her looks of sunny joy,
So careless, dignified, and coy.
And then, whene'er my suit I made,
She fled away through grove and glade;
While, tangled by the mistletoe,
The broken briar, and sulky sloe,
Powerless I sunk upon the plain,
And tried to rise and run again.
Again we sat in bower of bliss,
In perfect love and happiness;
My trembling arm by hers embraced,
Or twined around her slender waist;
Her cheek, as on a former day,
Still touching mine as if in play;
And her sweet breath, with sob and vow,
Playing around my burning brow;
While her light locks would heave as boon
As amber cloud above the moon.
Then would I wake in feverish pain,
And try to sleep and dream again.
The truth I well may blush to tell—
No living man e'er loved so well;
Or, if he better loved than I,
To hold his life I him defy.
My love was such, I could not rest,
In her dear presence, nor exist;
And, banish'd from her lovely eye,
I neither could exist nor die.
So, hasting back from whence I came,
Once more I breathed my fervent flame,
And prayed of her to save my life,
And instantly become my wife;
While I had neither rent nor field,
Nor home her lovely head to shield.
Well I remember, as I may,
The fears and trials of that day;
My importunities and tears,
And all her scornful jibes and jeers.
I went so far as to declare—
Nay, with an awful oath to swear—
That if she would not yield consent,
Most dreadful would be the event!
Denial would, in frenzy fell,
Consign me straight to death and hell!
Heaven grant me pardon as a meed,
For this was terrible indeed!
Alas, that day be ever mourned!
I found the tide against me turned—
Turned with a current chill and strong,
And my poor bark the shoals among,
Without one spirit-cheering ray,
Or star to guide my dreary way.
I was astounded to the heart,
And wounded in the tenderest part;
Bereaved of all esteemed on earth,
All I held my being worth;
A blighted ear in nature's field;
A bough lopp'd from her blooming weald:
A tree torn from her garden gay;
A star cast from the milky way,
And hurled like comet forth abroad—
A lonely thing, in paths untrod
To roam the universe of God.
I wrote in strains so wo-begone
It might have pierced a heart of stone.
No! 'twas the same—she would not bow
To lamentation nor to vow.
Thus roused from passion fierce and crude,
I did the deed I oft have rued;
Cursing the sex, away I ran
To purpose more becoming man.
Was I to sit and pule and whine,
And die despised at beauty's shrine?
No! I would forth and danger brave—
Would stem the wildest ocean wave—
Outgo the last of living men—
And beard the lion in his den!
I could not part without farewell;
So went my high resolves to tell;
My reasons—my engagement fast
To prospects and adventures vast.
"This is your doing, then!" said I,
With anger glistening in mine eye:
"Of your exploit now boastful tell;
And God reward you if 'tis well!"

Her simple answer all redeemed;
'Twas fraught with all by man esteemed—
With prudence far above her age,
Good sense and calculation sage.
Then turned her lovely face aside,
The bright and welling tear to hide:
Then with a softened accent said,
"I glory in the change I've made!
Before you asked my hand in love,
My choice was fixed, no more to rove;
For, save yourself, no other man
I ever loved, or ever can.
But, then, to see you as you were,
Involved in love's pernicious snare—
A very slave—to whine and pule,
And act the ninny and the fool,—
So grieved me, I resolved with pain
To bring you to yourself again,
And rouse your too-perceptive heart
To act a more befitting part;
This have I done, and joy to see't,
If borne no farther than is meet.
For my poor heart do not repine—
Be but a man, and it is thine!"
If I had loved too well before,
I now went nearly to adore,
My heart was wholly unprepared
To feast on such unfeigned regard;
And, wondering, on the accents hung
Of one so beautiful and young,
I now for the first time perceived
What I had sparingly believed,
That woman's fair and lovely breast
Was framed the sanctuary blest—
The home, all sacred homes above,
Of virtuous and of faithful love.
Sweet gentle sex! with all my zeal,
I ne'er can laud you as I feel.
If Nature's glowing hand imbue
Thy early bloom with beauty's dew,
Stamp in thine eye the witching wile,
And light with love thy opening smile,—
Ere prudence ripens to thine aid,
A thousand snares for thee are laid;
While still to revel, joyful, bright,
Among those snares is thy delight.
'Tis thus that thousands, wrecked and hurled
From virtue's paths, traverse the world,
Regardless of creation's scorn,
Unblest, unfavoured, and forlorn.
But as well women may compare
A David Haggart to a Blair—
A Hunt with Southey—or, I wot,
A lord of Buchan with a Scott—
A David Erskine to a Home—
Or Peel unto a reckless Brougham—
A Jeffrey with a tailor spruce,
Strutting with oil-wand and with goose—
A Wilson with the merest clown—
Or Doctor Brown with Doctor Browne—
As man take any tainted mind
For model of sweet womankind.
Nay, let us rise in our compare
To beauties of the earth and air,
With their reverses—range the sea,
The wood, the waste, the galaxy—
And rather urge a parallel
'Tween rays of heaven and shades of hell,
Than woman's fair and virtuous fame
Should suffer but in thought or aim,
Or from her sacred temples fall
One single flower celestial!
Take woman as her God hath made her,
And not as mankind may degrade her;
Else as well may you take the storm
In all its hideousness, to form
An estimate of nature's cheer
And glories of the bounteous year—
As well compare the summer flower
With dark December's chilling shower—
Or summer morning, pearled with dew,
To winter's wan and deadly hue—
The purple ocean, calm and glowing,
With ocean when the tempest's blowing—
Then say, with proud discourtesy,
"This is the earth, and that the sea,
And this is woman. Whate'er you will
Attempt to say, she's woman still,
And will be woman—more or less,
A being prone to perverseness.
Hath it not flowed from sage's tongue,
And hath not moral poet sung,
That men to war or business take,
But woman is at heart a rake?"
Injurious bard, such thing to say!
Degraded be thy shameless lay
For evermore to kindred slough!
Poor, slanderous reptile! what wert thou,
Such ruinous principle to own,
And damning dogma to lay down?
'Tis false! Could one of all thy race
So much dishonour and disgrace
The mother that him bore and bred,
Watching his young and helpless head,
As thus to brand with ruthless blow
Thy Maker's fairest work below!
Wo to the bard, whate'er his fame,
Who would attach promiscuous blame
To all the gentle, fair, and wise,
And only view to generalise!
For me, I'm woman's slave confest—
Without her, hopeless and unblest;
And so must all, gainsay who can—
For what would be the life of man,
If left in desert or in isle
Unlighted up by beauty's smile—
E'en though he boasted monarch's name,
And o'er his own sex reigned supreme,
With thousands bending to his sway?
If lovely woman were away,
What were his life—what could it be?
A vapour on a shoreless sea;
A troubled cloud, in darkness tost'd,
Alongst the waste of waters lost;
A ship deserted in the gale,
Without a rudder or a sail,
A star or beacon-light before,
Or hope or haven evermore;
A thing without a human tie—
Unloved to live, unwept to die!
Then let us own, through Nature's reign,
Woman the light of her domain,
And if to maiden love not given—
The dearest bliss below the heaven—
At least due homage let us pay
In reverence to a parent's sway—
To that dear sex, whose favour still
Our guerdon is in good or ill;
A motive that can never cloy—
Our glory, honour, and our joy.
Now, this third ardent strain, replete
With faults, I lay down at thy feet;
I've told my little tale full plain,
Of all my love and all my pain;
And well thou know'st when it is done—
Ay, knew'st ere it was well begun—
That thou alone the cause couldst be
Of all this suffering to me;

This thrilling tempest of the soul;
This passion that outbraves control—
That sways my heart, my thought, my breath,
And binds me thine in life and death.
Yes! hap what will, or hap what may,
In climes and kingdoms far away,
Where'er by fate I'm doomed to roam—
By sea, by land, abroad, at home—
No loss, no gain, no meed, no grace,
No mien or mould of human race,
My heart, betrothed, from thee shall sever!
'Tis thine, my love, and thine for ever!
My next and last, 'tis dread to think,
May come to thee from Indus' brink—
From palaces of old Surat,
Or sandy vales of Gujerat!
Where I may sicken, sink, and swoon,
Beneath the whirl of the simoon,
A martyr to that sultry clime,
No more of love to rave and rhyme.
What now I see I scarce dare tell,
In framing of the word FAREWELL!
Alas! it bodes us aught but good—
My pen is dripping crimson blood!
The leaves and flowers have changed their hue,
And purple gleams the morning dew.
Before my heart is turned to stone,
Away, pernicious pen—begone!

END OF CANTO THIRD.

From the Foreign Quarterly Review.

NEW ARABIAN TALES.

1. *Contes Arabes du* Cheikh al Mohdy. Traduits par J. J. Marcel. Paris. 1834. 8vo.
2. *Les Aventures de Kámrúp.* Traduites de l'Hindústáni par M. Garcin de Tassy. (Printed for the Oriental Translation Committee.) Paris. 1834. 8vo.

"The gorgeous East," says an intelligent traveller, "the mother-country of the human race, of civilisation, of literature, and of the arts, always excites a deep sympathy in the bosom of Europeans; we regard its mighty monuments as we should the tombs of our fathers, and receive accounts of its stereotyped customs as descriptions of the habits of our ancestors." This feeling is considerably strengthened by the association of Arabian Tales with the fondest reminiscences of early youth. Dear, delightful Scheherazade! who is there that loves not to recall the hours of stolen pleasure, devoted to the stories with which, during a thousand and one nights, thou didst delay the stroke of fate, and change the stern resolve of the cruel Schahriar? The days are gone when we gave full credence to the marvels of Aladdin's lamp and ring, when the voyages of Sinbad appeared as authentic as those of Ross and Parry; but we must confess, notwithstanding the hazard of incurring all the ridicule of this utilitarian age, that we still love to revel in these wild and wondrous scenes of oriental imagination.

"The weary soul they seem to soothe,
And, redolent of joy and youth,
To breathe a second spring."

The translator of these tales, the Chevalier Marcel, was director of the French printing-office, established in Cairo when the French took possession of Egypt. He formed there a close intimacy with the Sheikh Al Mohdi, secretary to the divan at Cairo, and received from him the manuscript collection of tales, of which the translation is before us. Before entering on any examination of their merits, we must turn our attention to the translator's interesting biographical sketch of the author, who acted no humble part in the several revolutions that seem now likely to work out the moral regeneration of Egypt.

Al Mohdi was a Copt and Christian by birth; these degenerate relics of the ancient people of the Pharaohs, like the Byzantine Greeks, rendered themselves useful and almost indispensable to their Mahomedan masters by their financial and diplomatic skill; they had the monopoly of all the administrative details of the government, and the possession of some lucrative arts, which in some degree compensated them for the civil and military degradation to which they were subjected by their conquerors. It is a singular fact, that the Copts have preserved from time immemorial, exclusively, the secret of hatching chickens by artificial heat. The Turkish and Arabian proprietors of the ovens are obliged to have recourse to Coptic servants, and every attempt that they have made to break the monopoly has completely failed.

Al Mohdi's father was named Abifanius Fadl-Allah, a singular mixture of Greek and Arabic, not unusual in the names of those who are descended from the subjects of the Ptolemies and the Fatemite khalifs: Abifanius is simply the Greek Επιφανιος (Illustrious), and Fadl-Allah signifies in Arabic "divine virtue."

Abifanius held the office of secretary to Suliman Kashef, the friend and companion of the celebrated Ali Bey; when his son had attained the age of thirteen years, Suliman wished to have him enrolled amongst his Mamelukes, but Al Mohdi had little taste for the hardships of a military life, and entreated his patron to aid him in literary and scientific pursuits, so that he might become qualified for a civil office. Sulimán consented, and procured him admission to the celebrated Mussulman academy established at Cairo, in the *Jami-al-azhar*, or "illustrious mosque," but which travellers more usually call "the mosque of flowers." His admission to this mosque was of course purchased by a change of his religion; but the boy had never the bad feelings of a renegade, and, during his entire life, the remembrance of the better creed he had left saved him from imbibing the bigotry and intolerance of Islamism.

During thirteen years Al Mohdi devoted himself diligently to study, and we find in his writings traces of his acquirements in European science and literature, as well as an intimate acquaintance with the poets and historians of the east. From his father he learned the routine of financial and diplomatic arrangements, and the hereditary secret of the Coptic race, while his acquirements in theology and Mahomedan law were so celebrated, that at an unusually early age he was dignified with the title of sheikh, and regarded as a high authority in matters of casuistry.

When Al Mohdi had attained his twenty-sixth

year, Ali Bey had become the leading man of Egypt; Suliman recommended the young sheikh to his notice, and Ali, a shrewd judge of talent, in a short time made him one of his secretaries. During the troubled but glorious career of Ali Bey, who, with inferior means and far less available opportunities, commenced reforms as extensive and perhaps more prudent than those that Mehemet Ali has effected, Al Mohdi faithfully supported his cause, seeking no reward in prosperity, making no attempt to escape in adversity. When Ali Bey fell by the treachery of those whom he trusted, Al Mohdi became an exile in Syria; but after the lapse of two years he was recalled by Ismael Bey, and restored to his former office. By consummate prudence he managed to continue neutral during the fierce contests that preceded the French invasion, and when Cairo was taken, the general voice of the citizens pointed out Al Mohdi as the person best suited to direct the administration of Cairo; Napoleon, with his usual wisdom, immediately ratified his appointment. M. Marcel soon become an especial favourite with the sheikh, but he tells us that the progress of his friendship was greatly accelerated by some bottles of excellent brandy, for which the sheikh, notwithstanding the prohibitions of the Koran, had a strong *penchant*. We were amused by a conversation between him and his translator on this delicate subject.

"*M.* My worthy sheikh, has not your prophet, on whom be peace and benediction, forbidden expressly, in the Koran, the use of wine to the faithful?

"*S.* No: look to the book.

"*M.* Here it is, read this passage in the second Surat: 'They will ask thee concerning wine and lots. Answer, in both there is great sin.'*

"*S.* Continue the verse—'and also some things of use unto men.'

"*M.* I will in my turn, read on, 'but their sinfulness is greater than their use.' Turn also to the fifth Surat: ,O true believers! surely wine, and lots, and images, are devouring arrows, are an abomination of the work of Satan, therefore avoid them, that ye may prosper. Satan seeketh to sow dissension and hatred among you by means of wine and lots, and to divert you from remembering God, and from prayer.'†

"*S.* Very well: but I never gamble, and in taking a cheerful glass with you, I feel that the bonds of our friendship are tightened—one glass more! Here's to your health, and the continuance of our friendship!

"*M.* Thank you, but you have not answered me respecting the prohibition of wine.

"*S.* This is not wine; a small glass more.

"*M.* Here it is. It is not wine, but it comes from it; besides all the commentators and all the traditions join in prohibiting Mussulmans the use of strong liquors that intoxicate.

"*S.* Oh! this does not intoxicate me. One little glass more."

The chevalier was fairly beaten, and left the sheikh master of the field.

But the wisdom and liberality of Al Mohdi were more conspicuous on another occasion, when the French general, either through carelessness or ignorance, had outraged the religious prejudices of the leading Mussulmans in Cairo. The general-in-chief invited to a splendid banquet the principal officers of his staff and the most eminent citizens. In the midst of the feast, the servants placed before each of the guests a glass of excellent white wine.

"Soon murmurs were heard, by degrees the whispers became louder, surprise and discontent were displayed in every countenance.

"'It is wine,' said one.

"'Wine!' shouted another. 'Wine to Mussulman sheikhs! and in public!'

"'It is an insult,' said a third; 'artful means devised by vengeance to lower us in public estimation!'

"'Let us depart,' exclaimed a sheikh, more exasperated than the rest, 'and proclaim to our fellow citizens the insult that has been offered to us, and through us to our religion and our holy prophet!'

"The sheikh Al Mohdi had not lost any of these symptoms of irritation, and of those still more dangerous proposals, whose consequences were likely to prove deplorable in a city recently pacified, where a brand thrown at random might kindle a vast conflagration.

"He had seen all and heard all, without seeming to pay the least attention, apparently plunged in that apathetic reverie, in which the Orientals are so fond of indulging. Suddenly he seemed to awake, and with a tone of surprise demanded, 'What is the matter?—what troubles you?'

"They explained to him the subject of the general discontent, 'They have offered us wine to drink!' 'Perhaps it is not wine,' said the sheikh, calmly taking up his glass and looking at it; 'assuredly it is not wine; wine is never of this colour.' The angry passions began to subside, and it was obvious that the minds of the Mussulmans would take the direction given them by their able chief, whose learning and orthodoxy were well known. After a short pause, he lifted the glass and swallowed its contents, saying, 'Let us see what it really is;' then with a true epicurean smack of the lips, 'It is wine, my brethren, but it is delicious, and if it be a sin for me or for you to drink it, may the holy prophet cause the sin to fall on the Franks.' He demanded a second glass, the sheikhs followed his example, and drank, exclaiming, 'Be the sin on them! be the sin on them!' Discord fled from the table, harmony reigned in its stead, the festivity of the evening suffered no further interruption, and there was no insurrection in the city."

Like most of the Orientals, Al Mohdi was fond of punning upon names; Bonaparte he called *Bonna Bakht* (the edifice of fortune); Kleber, *Kalah-ber* (the fortress of the country); and Menou, *Men-hu* (what kind is he?). After the departure of the French, the sheikh was continued in his situation, and so universally was he respected, that when the Albanians broke out into insurrection, and attacked the Frank quarter of Cairo, in July, 1804, the women and children found a safe asylum in his house, which even these licentious mercenaries dared not violate. He subsequently took an active part in the elevation of Mehemet Ali to the government, and was appointed chief of the sect of Shafâi, one of the four orthodox sects of Islam. Mehemet Ali, however, finding that Al Mohdi opposed some of his projects, treated him with coldness, in consequence of which he retired into private life, and died in the bosom of his family, at the advanced age of seventy-nine years, A. D. 1815.

The tales which Al Mohdi collected are divided

* Sale's Koran, vol. i. p. 37.

† Ib. vol. i. p. 39.

into two unequal portions, the second being about double the length of the first; both are connected by the history of Abd-er-rahman al-Iskanderani (the Alexandrian), who is the Scheherazade of the work. The first portion, whimsically entitled by the author "The Present of an Unmarried Awakener, for the amusement of him who loves slumber and sleep," was translated and published some years ago under the title of the "Ten unfortunate evenings of Abd-er-rahman al-Iskanderani." Its success induced M. Marcel to revise and improve it, and to add the second and more interesting portion, called "Conversations in the Moristán, or Revelations of the Lunatic Asylum at Cairo."

The plot of the main story is more ingenious but less romantic than that of Scheherazade and Schahriar. Abd-er-rahman being left in possession of a large fortune by his father, a wealthy merchant of Alexandria, devotes himself intensely to study, and makes a proficiency which he fondly deems unparalleled. Desirous that others should profit by his learning, he prepares narratives to read to his friends. Ten times he adventures as a story-teller; on each occasion his auditors are put to sleep, and some dread misfortune is brought on the hapless author's head. The tenth evening brings him to beggary, and consigns him to the Moristán, or Lunatic Asylum of Cairo.

On the first occasion, Abd-er-rahman began by assembling his slaves and reading to them a *resumé* of history, which, sooth to say, is not wholly destitute of soporific qualities. Before he had concluded, they had all fallen asleep, leaving the doors and gates unfastened. The naïb or chief of police, discovering this negligence as he went his rounds, ordered his attendants to nail up the doors, and inflicted a very heavy fine on Abd-er-rahman, for thus affording temptation to robbers.

The unfortunate story-teller consoled himself by reflecting on the proverbial stupidity of slaves; he resolved to assemble a more enlightened auditory, and for this purpose invited his friends and acquaintances to a magnificent entertainment. After they had feasted on the richest dainties, Abd-er-rahman produced his manuscript, and read a very interesting narrative, showing the necessity of men reposing all their trust in God. But, alas! his auditors fell asleep once more; on looking round, however, he discovered four who had escaped the general somnolency, and he complimented them highly on their taste and love of learning. They, in return, expressed so deep an interest in his narrative, that they wished to see the historical authorities on which it was founded. The delighted author went to seek them in his study; they were not easily found, and he was consequently absent for some time. When he returned, the four attentive guests had disappeared, and along with them had vanished all Abd-er-rahman's rich service of plate, with the exception of one salver, on which Al Harrami, the notorious robber, had written some lines, thanking Abd-er-rahman for his entertainment.

The next morning Abd-er-rahman went to lodge his complaint before the aga of the Janissaries, taking with him the salver on which the robber had written his complimentary letter. He found the aga mounted on horseback, surrounded by a crowd of suitors, to whose complaints he could give but distracted attention. Abd-er-rahman stated his case and exhibited the salver; the aga heard little and comprehended less of the complainant's statement, but demanded that the salver should be handed to him for closer inspection. No sooner had he seen the robber's letter than he furiously accused Abd-er-rahman of being an accomplice of the gang, and without hearing his explanation, ordered him to be bastinadoed. The orders were instantly obeyed, while the surrounding multitude loudly cheered the prompt justice of their magistrate. Nor was this all: Abd-er-rahman was sentenced to pay a very heavy fine to prevent further proceedings before a superior tribunal.

The next audience to which Abd-er-rahman recited was composed of his relatives, whom he had assembled to celebrate his reconciliation with a cousin, who had been reduced to distress by a career of vice and profligacy in a distant land, but who represented his poverty as the result of inevitable misfortunes. Abd-er-rahman believed the tale, and by a romantic excess of generosity, lent him a large sum of money in private, while publicly he affected to entertain suspicions of his character. The third tale produced the same effects as the preceding, but the sleep was not immediately attended with any fatal result. However, such soon appeared; Abd-er-rahman had placed the bond given him by his cousin in the leaves of the book from which he read to his guests, whence it was easily abstracted by the fraudulent debtor, who laughed the unfortunate story-teller to scorn, when he went to seek for payment. A law-suit followed. Abd-er-rahman's case, of course, completely failed, and he had not only to pay all the costs, but a very heavy fine for having brought a false accusation before the tribunal; he had also to endure the bastinado a second time for perjury.

A bright idea now seized Abd-er-rahman; he resolved no longer to lead a single life, but to obey the recommendation of the Koran, and take a wife. We spare our readers an enumeration of the learned arguments by which he fortified his resolution; one, however, deserves to be noticed.

"Amongst the details of the interesting picture which my imagination formed of wedded joys—a husband in the arms of a beloved wife—a father surrounded by prattling children—I cannot venture to deny that there glided in, almost unconsciously, the image of a father and husband reading his histories to his wife and children—reading when he pleased, without fearing refusal or interruption: it seemed an audience ready prepared, always at hand, always attentive; and I was surprised that I had never thought of it before."

The lady whom he chose was of illustrious birth; she was the daughter of a *sherif*, or descendant of the prophet; and though still young, she was the widow of another *sherif*, to whom she had been contracted in infancy. The nuptials were celebrated with great magnificence; but unfortunately, to enliven the marriage-feast, Abd-er-rahman told a story, pointing out the folly of family pride, and the hazard of marrying ladies

of noble birth. All went to sleep except the brother of the bride, and he, believing that the tale was an insult to his family, drew his sword, rushed upon Abd-er-rahman, and before he could make any preparations for defence, smote off his ear. The tumult awoke the guests, a tremendous uproar ensued, the police interfered, Abd-er-rahman fainted from loss of blood, and on his recovery found himself in prison. As the case related to *sherifs*, it came under the cognisance of the *nakib-al-ashraf*, or chief of the illustrious descendants of the prophet: he of course decided in favour of his relatives, and the unfortunate story-teller was not liberated until he had paid a very heavy fine.

Abd-er-rahman, however, found some consolation in the affection of Fatima, his noble spouse. She declared herself so anxious to make some compensation for the wrongs he had suffered from her relatives, that he ventured to request she would listen to one of his stories. Fatima long resisted, but was finally persuaded, and her husband inflicted upon her a narrative of greater extent than any he had yet ventured to relate. Of course she fell asleep; her gown swept over a chafing-dish which was placed in the room; it took fire; the flames communicated to the tapestry; and before the conflagration could be extinguished, Abd-er-rahman's mansion and furniture were consumed, and he was severely fined for negligence that endangered the safety of the city.

Fatima escaped with life, but no persuasions could induce her to become a listener a second time. Abd-er-rahman, therefore, resolved to take another wife, and he chose an old maid named Alima. Two wives in one house naturally disagreed; Alima especially was jealous of the least attention shown to Fatima, and in order to cure her, Abd-er-rahman resolved to tell a story. Great was his delight when Alima not only expressed a willingness to hear it, but declared that she would remain standing all the time, in order to resist the drowsiness which had overcome his former auditors. But, alas! before the tale was finished she fell down and broke both her arm and leg. The physician summoned to attend her displayed so little skill, that Abd-er-rahman refused to pay him: the case was brought before the *ulemas*, or doctors of civil law, to which respectable body the physician belonged, and Abd-er-rahman had to pay, not only the bill, but very heavy damages for having spoken disrespectfully of the learned professions.

"Though the ass may make a pilgrimage to Mecca, yet an ass he will come back," says a proverb quoted by our inveterate story-teller to excuse his perseverance. Abd-er-rahman took a third wife, a beautiful young girl called Lúlú, or "the pearl," in consequence of her charms, but which was changed into Zeinab, "the ornament of her father," from the fame she brought her family. But Zeinab was an idiot, and Abd-er-rahman searched among his histories for one that might awaken her ideas. He took the precaution of placing some slaves in the apartment, and to banish the danger of sleep, permitted them to interrupt him by questions and comments. Zeinab's questions were so absurd and childish that her husband soon ceased to answer them, and she and her slaves were quickly asleep. A terrific crash in the kitchen disturbed the party; Abd-er-rahman had delayed supper to the conclusion of his lecture; a strange dog, guided by the scent of the meat, found a way into the house, and tumbled down the plates as he made a spring at a tempting shoulder of mutton. The slaves hastened to punish the intruder, but the dog fled with his prey, and escaped into one of the city sewers. The noise attracted the notice of the police; some doubt was felt respecting the excuse assigned for the riot, the sewer was opened, and in it was found, to the horror of all true believers, a leg of pork, which the dog had probably stolen from some infidel's kitchen. Such a crime could not go unpunished; Abd-er-rahman was brought before the great council of the ulemas for the crime of having swine's flesh dressed in his mansion; the evidence was deemed conclusive before a tribunal already prejudiced against him; he had once more to endure the bastinado and pay a heavy fine.

A fourth wife, named Zahara, was taken by the inveterate story-teller, and the very second day after his marriage he read to her a new narrative. Zahara fell so fast asleep that she could not be awakened, and as the tale recited to her had been one of *diablerie*, the slaves reported that their master had bewitched his spouse. Abd-er-rahman was thrown into prison, and before he was liberated had to undergo the torture several times. Zahara had, however, only counterfeited this supernatural slumber to have an opportunity of escaping with her gallant. When this was made known to the judges, they acquitted Abd-er-rahman, and he was allowed to return home without paying any fine.

He next purchased some slaves for his harem, believing that he could command more attention from them than from his wives. One evening he assembled them in a kiosk, or summer-house, which he had erected in his garden, and having trimmed his lamp and produced his manuscript, threatened them with the severest punishment if they dared to fall asleep. When he concluded, he found that all his auditors but one had stolen away, and she was buried in slumber. By a sudden angry movement Abd-er-rahman overthrew the table and lamp; the awakened slave fled with the speed of lightning; and Abd-er-rahman, pursuing her in the darkness, tumbled into a reservoir, which, luckily for him, was only half full of water. It was, however, so deep that he could not get out, and so far from the house that his cries could not be heard. There he remained until the muezzin ascended a neighbouring minaret to proclaim the hour of morning prayer, when his cries attracted the notice of this pious functionary. Abd-er-rahman was extricated, but was attacked by a severe fever, which almost brought him to the grave. Scarcely had he recovered, when he was summoned to appear before the priests of the mosque to answer for the crime of interrupting the muezzin's holy proclamation. The chief mollah, however, treated him leniently, sentencing him only to bestow a large sum in alms, as an atonement for his impiety.

Abd-er-rahman was now at his wit's end; but he resolved to make a final effort, and to have the tale read by his slave, in order to determine whether the matter or manner of his recitals had most share in producing his former calamities. A splendid banquet was prepared, a large company assembled, the feast was concluded, the reading commenced, and Abd-er-rahman was the first to fall asleep. When he awoke, he found himself alone with the reader; he went to search the house for his guests, and received ocular demonstration that he was plundered by his slaves, and dishonoured by his wives. Transported with rage, he attempted to take immediate vengeance, aided by some domestics that still remained faithful; a terrible scene of confusion ensued, the police rushed in to learn the cause, and the guilty parties with one accord proclaimed that Abd-er-rahman was insane. His violent behaviour when brought before the magistrates gave credibility to the accusation, and he was sent to the Moristán, or Lunatic Asylum of Cairo. Here he continued ten years. When he was at length permitted to quit it, he found his house in ruins, his wives married to others, and all his property destroyed. Thenceforward he became a strolling story-teller, and gained a miserable livelihood by reciting his narratives to caravans of pilgrims.

The second portion of the work contains an account of what Abd-er-rahman heard and saw in the Moristán. He bore his lot with patience, and soon acquired the favour of his keepers. They soon permitted him to walk in the courts, along with some of the inmates whose mildness of demeanour justified such indulgence. Here he became acquainted with three persons who had, like himself, lost their ears and been lamed. After a short time he discovered that the resemblance was still more perfect, for each of them retained his senses. They were, however, worse disfigured than our hero, and he could not avoid expressing a desire to learn the cause of their calamities. It was agreed that each should relate his history. Abd-er-rahman soon after, with other supposed lunatics, came to listen to these narratives, and amongst the latter, he found his perfidious cousin, and his faithless wife, Zahara. The number of narrators was thus increased, and we should be sorry that any one of them withheld his history. As a specimen of these "Revelations of the Moristán," we shall extract, with some curtailments, the history of Rafif, the squinting astrologer of Alexandria, both because it illustrates the customs and superstitions of the east more vividly than any other, and because it introduces us to Jezzar Pacha, one of our "ancient allies," who, assisted by Sir Sidney Smith, beat off Napoleon from Acre, and thus materially aided in frustrating the French expedition to Egypt. Rafif excited the attention of his auditors by declaring that he came to the Moristán in consequence of a quarrel with the sun, moon and stars. Such a preface appeared to Abd-er-rahman an evidence of insanity, but seeing that the rest of the audience heard it unmoved, he took courage and invited Rafif to go on with his history.

"I am a native of Smyrna: the circumstances of my infancy have left such a feeble impression on my memory that I can with difficulty recall them. Moreover, I remember perfectly, that from my earliest infancy the first object that struck my view was a piece of red cloth, suspended from my little turban, which hung over my forehead in the shape of a tongue, falling so exactly between my eyes that the pupils were constantly directed towards it by an involuntary attraction. My mother, full of tender fears, had used this means as an efficacious talisman to ward off the danger of *the evil eye*, which which might be turned upon me. I did not lay aside this amulet until I was nine years old, when, being admitted into the congregation of the faithful, I had acquired a right to the protection of our holy prophet, and *the evil eye* could no longer injure one of whom our divine religion was the parent and guardian.

"My father was secretary to the kadi of Smyrna. He designed me to be his successor, when age and education had qualified me for the place. He was especially anxious to instruct me in jurisprudence, and no sooner was I able to read than he placed in my hands the works of the most celebrated Mahomedan lawyers. I had no taste for the study thus recommended to me, and I confess that I preferred the sports of my youthful companions to dry studies on law and equity. Whenever I could make my escape, I went to sport with my comrades, sometimes in the fields, sometimes in the gardens that surround the city.

"Detained all day in court by his professional avocations, my father was ignorant of my constant truancy; and my mother, who loved me with all the mistaken fondness shown to an only child, was careful to conceal my faults. In our meetings, each of my companions had a nickname; they called me, I know not why, *the squinter*, and I have been so accustomed to the title that I have kept it to this day.

"I had reached my sixteenth year without troubling myself much about the future, when all my father's hopes were suddenly overthrown—the kadi, his protector, was disgraced, all his property confiscated by the Divan of Constantinople, and he was forced to resign his dignity to a successor sent from the capital. The new dignitary, though a Turk by birth, showed some regard for his predecessor, and seeing that the confiscation of his property had deprived him of all resources, he generously offered him the post which my father had hitherto occupied.

"The old kadi was but too happy to accept an offer which came so luckily to extricate him from his difficulties; and my father becoming the chief victim of these double reverses of fortune, was so deeply grieved, that in eight days I followed him to the tomb. My mother, who had been ailing long before, did not long survive her husband, and I suddenly found myself an orphan, with no prospect but the deepest misery.

"I knew nothing; I had no means of procuring the necessaries of life; my former comrades were too young to give me any assistance; I had only some distant relations, who cruelly refused me even a lodging. One of them, more compassionate than the rest, was pleased at least to give me some advice; he counseled me to address the new kadi, implore his pity, and solicit the lowest place in his household, the meanest occupation that could afford me the means of subsistence.

"I hastened to follow this advice; want, which I now felt bitterly, permitted neither hesitation nor delay. I ran to the kadi's door, I solicited and obtained permission to appear in his presence. I found him seated on cushions in a corner of a large saloon, and in the opposite corner was the old kadi discharging the duties which were once performed by my father. The physiognomy of my future protector appeared favourable, and seemed to promise a happy result. I made my request, which I deemed it right to accompany with the most extrava-

gant eulogiums, declaring him the most illustrious of all kadis, past, present and future, the only man on earth capable of filling such an exalted office, eclipsing the glory of all his predecessors, and depriving his successors for ever of all hope of displaying similar merit.

"During my harangue, the expression of his countenance totally changed; by degrees his brow darkened, his eyes sparkled, and finally his voice was raised against me with all the fury of the most violent indignation. He fiercely reproached me with having been sent by his enemies to insult him at his own tribunal, asserting that my praises were addressed to the old kadi, towards whom he declared that my looks were constantly directed, though, as I have already said, he sat at a distance on the opposite side of the room.* He would not listen to any apology or explanation, and the only result of my audience was to be forcibly ejected from the mansion, where I hoped to find a refuge, with orders to quit the city immediately, and never to return.

"In the course of the same evening the old kadi, who, as it seems, had made a similar mistake, sent secretly to thank me for the courage which I had maintained his superiority over his successor, and displayed his gratitude by sending me some provisions and a small sum of money, adding that he would secure me a passage on board a vessel which was to sail the following morning.

"I had lost by some unforeseen error the protection I had sought, and I did not conceive it necessary, by confessing the truth, to reject the unexpected patronage which by the same error I had involuntarily procured. In fact, my design was, by praising the new kadi and exalting him far above his predecessor, to take vengeance for my father and myself at the same time, whose modest place he had usurped; and assuredly I was far from imagining that he would mistake this part of my address for flattery. But by some inexplicable fatality my designs were frustrated; my praise was mistaken for reproach—my reproach for praise.

"I made enquiries about the ship to which I had been recommended; she lay at the entrance of the harbour, and I instantly went on board. The captain had received notice of my coming, and employed me as his attendant during the trip. Our voyage was not long; our destination was Iskanderùn (Alexandretta), and in five days we reached that Syrian port without encountering any danger. I was engaged, as I have said, by the captain only for the trip. As soon as he had cast anchor, he informed me that he had taken me on board only out of complaisance to the old kadi, and directed me to seek a new master in the town which we had just reached. As I had no luggage, my disembarkation was easily effected; during the rest of the day I wandered through the streets and bazaars of Iskanderùn; no one spoke to me, and I did not dare to address any body.

"When evening came, I sat down sorrowfully at the end of the long pier which forms the harbour, reflecting on my sorrowful position; not knowing where I could procure shelter for the night, whose shades were thickening around me, nor food for my empty stomach, which was manifesting its uneasiness by audible grumblings. My glances were mechanically turned to my left over the long promontory which, extending into the sea, closed the gulf on that side, and hid from view the summits of the lofty mountains of Kribrûs (Cyprus). All at once I saw near me a tall, stiff, and meagre figure, which seemed to me a real ghost. This being, whose approach I had not observed, and whose presence froze me with horror, had two piercing eyes, a countenance of cadaverous paleness; his bones seemed ready to burst through a skin as dry as parchment; his brows were thick and beetling, and a long white beard hung in wild disorder below his chest; he wore a dark coloured robe, and his motions were as precise and regular as if they had been the result of machinery. His eyes were fixed on the starry heavens, and he directed his view successively to different stars, using instruments of curious construction, the like of which I had never seen.

"I felt assured that this strange being was a magician, practising some of his diabolical arts, and I expected that the evil genii would immediately assemble around him in obedience to his necromantic spells. Fear kept me motionless; I kept my eyes fixed upon him, attentively watching his movements; they were all new to me, and I expected momentarily to become their victim. My danger appeared to increase when I saw this mysterious and awful being lower his looks to me, and his glance met mine.

"After some moments of mutual and silent observation, during which drops of cold perspiration streamed from my forehead, he addressed me in a hoarse voice, whose tones, however, were not at all menacing. 'Friend,' said he, 'I see with pleasure that you share my tastes and pursuits; during the last half hour, I perceive that your looks have been directed towards that brilliant sky which extends its splendid canopy over the summit of Mount Taurus, and now your eyes, directed to the zenith, seem anxious to penetrate through the group of nebulous stars directly over our heads. Tell me, which is the constellation that has thus engaged your attention?'

"Reassured by hearing a human voice from this frightful body, which I had taken for some supernatural being that haunted this solitary place, I was about to reply, but he did not give me time. 'You may,' he continued, 'bless your fate and the constellations that protect you: I am the celebrated Abd-al-nejûm (servant of the stars), whose high acquirements in astronomy have procured him the surname *al Feleky* (the Celestial). Perceiving you just now with your eyes fixed on the starry heaven, I easily divined that you were impelled by some insurmountable impulse to my favourite study. I immediately observed with care the aspect of the heavens, I have found it favourable to you, and it has enjoined me to cultivate your taste for such exalted knowledge. Come then with confidence, my son; Abd-al-nejûm will in your company penetrate the palace of science; come with me, my house shall be your residence and your academy.'

"The astronomer then took me by the hand. Delighted by such an unexpected invitation, I permitted him to lead me in silence, dreading that too speedy an explanation might lead him to change his benevolent purpose. We passed through several narrow streets in the meanest quarter of the town, and after several turnings, stopped before a small house, whose appearance was far from sumptuous. Abd-al-nejûm opened the door himself; a circumstance which convinced me that he had neither slaves nor servants. Taking me again by the hand, he led me in the dark to a confined spot, where he desired me to sit down. Having lighted an old lamp, he turned to examine his new guest. He appeared surprised at the poverty of my dress, which the darkness had hitherto prevented him from noticing; his tone immediately changed, his kind proffers gave place to stern and imperious questions. Not being able to avoid a reply, I related, without disguise, the circumstances that had brought me to the place where he found me; and where my glances were vaguely directed over the surface of the western waters, instead of being elevated, as he supposed, to the brilliant sky of the east. I testified my gratitude for the kind offers he had made, but did not conceal that food was with me a more pressing want than lessons in astronomical science. Abd-al-nejûm sat down on a wretched mat, which was almost the only article of furniture in his room, and resting his head upon his hands, seemed lost in thought. At length

* The reader must remember that Raffi squinted.

he proposed to take me into his service, on condition that I should ask no wages, but be content with bed and board, promising that if I proved faithful he would make me his heir.

"I lived with him very miserably for twelve years; when I asked him for instructions, he said that nature herself had forbidden me to become an astronomer. Every day he repeated that the stars promised him great wealth and length of life; but nevertheless, I found him one morning dead in his bed, and conformably to his promises I was his sole heir. The inheritance, however, was only some few articles of furniture, and his mathematical instruments. The owner of the house soon gave me notice to quit; I made a little money by the sale of the furniture, and, carefully preserving the astronomical instruments of my deceased master, I sought another lodging.

"I obtained it in the house of an old woman who lodged in the suburbs, to whom I had sold some pieces of paper covered with figures, on which my master had written his scientific calculations, which she had purchased as talismans, to increase the fertility of her pigeons and keep them from vermin. I had no difficulty in persuading her that I had inherited the knowledge as well as the instruments of my old master; and her neighbours of both sexes flocked to obtain the aid of my astrological talents. All my master's old papers on which he had scribbled figures were successively sold as talismans.

"Finding this new trade very successful, I resolved, like Abd-al-nejûm, to draw horoscopes, and predict future events from the stars. I had picked up from his conversation the names of some of the constellations, but I did not know what was their position in the sky; however, I hoped that I would easily acquire this knowledge by making use of the instrument. In vain I tried in every way to imitate what I had so often seen my master do; but somehow or other I could never distinctly see through the telescope the stars that my master saw, or perhaps only pretended to see. I have always thought that he designedly injured the instruments before his death, for fear lest the fame of my science might eclipse his own. My reputation increased every day, and unfortunately for me it extended too far. My fame reached the governor of the city. He was about to become a father, and summoned me to draw the horoscope of the unborn child. I went boldly, pretended to make some observations, drew some whimsical figures, made some idle calculations, and unhesitatingly declared that he would soon be the father of a boy. I did not know that my new employer had brought at a great expense another astronomer from Antakyeh (Antioch). He was posted in another part of the house, and announced that the child would be a girl. They brought us together, that we might compare our different horoscopes. I could make nothing of my adversary's scheme; he easily demonstrated that mine was composed only of figures drawn at random, calculations either absurd or insignificant, and marks that had no connection or relation. For want of good argument, I overwhelmed my adversary with reproaches, and he retorted as well as he could. From words we were about to come to blows, when we received a piece of news which put an end to our quarrel. The women who had been summoned to attend the lady announced that she was not pregnant, but dropsical."

Rafif then relates, that being banished as an impostor, he fled to Syria, where he fell in with a band of robbers, who carried him bound to Acre, and set him at liberty on condition of his remaining in the city, and presenting himself every evening at the great fountain which supplies the town with water. He obtained admission to the house of a Jew, by promising him an amulet that would protect him from the tyranny of the pacha, deservedly called Jezzar (the butcher). The Jew's daughter, who unfortunately was but

> "A sign-post likeness of the human race,
> That is, at once resemblance and disgrace,"

fell in love with the astrologer; but he rejected her advances on the plea that the stars prohibited their union. She accepted the excuse, and continued her kindness. During a fortnight Rafif presented himself regularly at the fountain, but the weather continuing cloudy, his services were not required. At length, one fine evening, he met at the rendezvous the captain of the robbers by whom he had been seized, and we shall now let him continue the recital of his adventures.

"'Here you come,' said a voice which I knew too well; 'I was waiting for you. If you have not your astronomical instruments, run and get them; and take care that you do not keep me long waiting.' Terrified and confounded, I hastened to execute his orders with all expedition, and speedily returned. 'Follow me,' said he; 'do not tremble thus: fear nothing; no evil will befall you, unless you bring it on your own head. Above all things keep perfectly silent until you reach your destination.' Then, without any further explanation, he began to walk towards one of the corners of the enclosure. I followed my mute guide without saying a word, endeavouring to persuade myself into reliance on the promise he had made.

"We soon reached a low and shabby-looking portal: it was opened without noise at a scarcely perceptible signal, and I was handed over by my guide to two other conductors as silent as himself. These new personages, who seemed to me either slaves or domestics, gave me in charge to two others in a second chamber; they again resigned me to a new pair in a third room, and thus I was transferred from the hands of one pair to those of the next, until I reached the presence of their master.

"I have said *from the hands*, but this is an inaccurate expression: not one of those whom I encountered in my passage had retained possession of his entire person. One had lost a hand, another a foot; this had been deprived of an eye, the next wanted a nose or ears. Among them there was not one complete man; they were rather 'the ruins of humanity'—ruins more or less mutilated and disfigured. No where could there be found such a collection of the halt and maimed; it seemed that a person in full possession of his limbs was incompatible with the arrangements of this extraordinary mansion. 'Great God!' thought I with a shudder, 'am I doomed to wear the livery of this miserable band?'

"These involuntary reflections were cut short by my admission into the last room. It was badly lighted by a single lamp, and the corners were shrouded in almost total darkness; the furniture was mean and scanty: but when I glanced around I beheld the glitter of scimitars, daggers and swords, and through the shade along the walls I saw about twelve soldiers perfectly motionless, standing in frightful silence. At the extremity of the room, in the corner farthest from the door, there was seated on a miserable carpet, supported by filthy and torn cushions, a man already old, of haughty and ferocious aspect. His eyes were sunk in his head, but light flashed from them through the thick and shaggy brows by which they were covered, like the glare of the hyena thirsting for carnage. His savage appearance, and his brows rigidly contracted, announced the violent passions of a merciless heart. His beard was in disorder, his turban of coarse stuff badly arranged, his dress soiled and worn. In his girdle there was a large dagger and two enormous pistols; before him lay a naked sabre, and

other instruments of destruction. He smoked

ong the narratives that follow the history of
is one that seems designed as a parody on
ɔry of Aladdin. It is more ingenious than
ɔur Facardins of Count Hamilton, because
ɛr degenerates into caricature, and because
lventures, though very whimsical, follow
ther in natural order. The outline of the
ay be told in a few words. Morad, a young
ian, becomes possessed of a talismanic
ring, that ensures him the gratification of all his wishes; the genii, however, thus subjected to his sway, are malignant beings, who execute his behests literally, and thus place him constantly in the midst of dangers and difficulties. He wishes to be removed from the desert to his uncle's house, and is plumped down in the midst of a dinner given to the household; of course he is soundly cudgeled for the destruction of the feast; he desires to be placed in the midst of Bagdad, and immediately finds himself swimming for his life in the Tigris: he sees the pacha's magnificence, and desires to share in it; the slaves, directed by a mysterious power, bring him viands, but scarcely has he had time to taste them, when the pacha's guards appear to chastise the slaves and the intruder; he wishes to be removed to a place of safety, and is placed in the lowest dungeon of the city prison, with some wretches about to be impaled; he desires to be rescued from the horrors of an impending execution, and is hurried to the centre of India, where he narrowly escapes martyrdom from some superstitious Fakirs. After many similar adventures, Morad at length wishes to be in his own country, and is placed, bound hand and foot, on the summit of one of the pyramids; he then wishes to be restored to his father, and is rolled down the pyramid to his father, who was below searching for hidden treasure. His wounds and bruises throw him into a dangerous disease, which is followed by mental alienation, and he is consigned to the Moristán.

The specimens we have given of the New Arabian Tales show that they differ essentially from our old acquaintances, approaching more nearly to the European style of romance; but the second work which we have placed at the head of this article is almost a repetition of Scheherazade's narratives, and goes far to establish the Indian origin of "The Thousand and One Nights." The distinct and clear testimony of Massoudi, one of the most enlightened Arabian writers, ought indeed long since to have settled this question; he states that the Thousand and One Nights and the Voyages of Sinbad, of which he speaks as separate works, were translated from the Persian, that is, the Pehlvi, in the reign of the Khaliph Al Mansúr, consequently about thirty years before the age of Haroun-al-Raschid, who is now the hero of so many of the tales. The additional stories published some years ago by Von Hammer and Trebutién confirm Massoudi's account. Those that are of a purely Saracenic origin can easily be distinguished from those that have been derived from a more imaginative people; even the change made in the catastrophe, which Trebutién regards as a restoration of the original narrative, is a humorous turn quite inconsistent with the gorgeous fancy that dictated these wondrous fictions. In Trebutién's edition, Schahriar, so far from pardoning Sheherazade for her skill in story-telling, declares that he will have her put to death by torture for having talked so much nonsense, and only spares her life because he finds she has become a mother. Every reader must feel that this jest is an impertinence, utterly repugnant to the general character of the work.

"The Adventures of Kámrúp," translated from the Hindoostannee by Garcin de Tassy, are manifestly derived from the same original as the Voyages of Sinbad; for "the moving accidents by flood and field," recorded in both, are in many instances perfectly identical. We trust that this will attract the notice of some Sanscrit scholars in India, and stimulate them to enquire after the original work from which both have been taken. A translation from a Persian abridgment of the Hindoostannee poem was published by Colonel Franklin some years ago, under the name of "The Loves of Camarupa and Camalata," and a comparison of this with Garcin de Tassy's work leads us to believe that Sinbad's narratives, delightful as they are, have been shorn of much of their lustre in their passage through Persian and Arabic. Kámrúp is sadly ill-treated by the Persian compiler, several of the most interesting details being omitted and others sadly distorted; but especially the historical and geographical allusions with which the Hindoostannee poem abounds have been wholly neglected by the translators. Still, "The Loves of Camarupa and Camalata" may be read with pleasure,—

> "For sunshine, broken in the rill,
> Though turned aside, is sunshine still."

The suspicion that Sinbad's translator may have omitted much that was excellent has frequently crossed our minds, for Sinbad's voyages are manifestly not designed to be received as mere romances. Hole, in his admirable dissertation on them, has shown that many of the most extravagant fictions they contain were received in Europe as authentic facts during the middle ages, and that the wildest of the narratives may be paralleled in the veracious pages of Sir John Mandeville. The Tales of the Sheikh Al Mohdi, and the Adventures of Kámrúp, taken together, supply us with a sequel and commentary to the Arabian Nights, deeply interesting to all who love imaginative lore. The former enables us to determine the nature of the frame-work in which the Arabians set the gems derived from more fanciful climes. The latter enables us to estimate the nature and value of the treasures before they were placed in the hands of foreign artists.

Al Mohdi's Tales are valuable for other considerations; they reveal to us the present state and feelings of the Moslem inhabitants of Egypt, and show us the effect produced upon them by European intercourse. Traces of liberal sentiment and of a tolerant spirit are to be found in his collection, and fanaticism is only noticed to be condemned. There can be nothing more delightful than this appearance of dawning liberality in the lands that seemed for ever doomed to the darkness of bigotry.

Notes have been added to both these works by their respective translators; those of M. Marcel convey much curious and valuable information respecting eastern habits and customs; but we regret to say that M. Garcin de Tassy has given a mere philological commentary on the original text of Kámrúp, which he intends to publish on some future occasion. This arrangement seems every way objectionable: mere European scholars find a large portion of the book useless, and the future Hindoostannee student must purchase the translation as well as the original, if he desires to derive any advantage from the commentary.

From the London Athenæum.

Journal d'un Déporté non Jugé. Vol. II.*

Since our former notice of this work we have received the second volume, and shall, therefore, continue our abstract.

The escape of Pichegru, Barthelemy, the more important and active of the *déportés*, together with the death of many others, left poor Barbé Marbois, and some of his aged companions, to an increase of solitude and suffering. But two were left out of the original number. From this solitude, however, they were somewhat relieved by the arrival of one hundred and ninety-three new convicts, who disembarked at Cayenne in June, 1798. These were chiefly ecclesiastics.

> "Some condemned for fanaticism, others for having shown relics to the people, one for preaching dangerous doctrine, another for having performed mass. There had been neither trial nor judgment. One had been transported in the place of his brother. Another, condemned to quit France in fifteen days, had been kept in prison till the time expired, and was then transported for being found in the country. Some were under twenty."

One of the new batch was the poet, François de Neufchateau. Another was the superior of the College of Louvain, transported for exorcism, an imaginary crime. Some of the new comers soon attempted, and some effected, their escape. The shipwreck of one party is related, accompanied by some singular remarks respecting the hardihood of the Gallic Indians.

> "The Indian rowers swam all the way to the land, although it took them six hours to reach it. An Indian woman and a child, who were of the crew, helped themselves by holding to a barrel of tafia, which the lightness of the liquor caused to float; and so brought them to the beach. When the Indians are tired of swimming, they lie on their back, and the sea keeps them immovable. It is said, that they are specifically lighter than us; and such of them as I have tried to carry, I have always found sensibly lighter than the whites."

M. de Marbois's observations on the Indians, whose habits he unfortunately had such ample time to study, are curious and full of interest. But his disquisition on the existence of the Amazons, is, at this day, somewhat out of date. The account of his domestic life bears witness to the amiability of his character, which seems but to have called forth the severity of his persecutors. On one occasion, after having made some complaint, he is summoned from Sinnamari to Cayenne, and forced to perform the journey on foot, at noon-day, tantamount almost to a sentence of death. He is sent back just as cruelly, for signing a petition more ceremoniously than was thought consistent with republican etiquette, or the want of it. At length, however, the directory itself began to totter, and its agents, foreseeing their fall, thought fit to relax their severity. Marbois and

---

Laffon, all that remained of the old exiles, were ordered definitively to return to Cayenne.

"We left Sinnamari," (continues M. Marbois) "on the 1st of August, 1799. I quitted it never to return—that place where my enemies intended to have confined me until the day of my death. A Galibi ran after me; he made me a present of a bow and arrows, and of a collar of tiger's teeth. I turned, for the last time, my looks towards the cabin, that I had inhabited for two whole years. I saluted my cinnamon trees, my bread and clove trees. I went by that road which will long recall to the planters the exile whose work it is. I passed before the cabins which Murinais and Tronçon inhabited, and near the cemetery where their remains repose. Adieu, Simapo! Adieu, forests and deserts which the Sinnamari laves. Insatiable tombs, which I have seen so often open, I escape you! Sepulchre of my friends, adieu! for ever, adieu!

"I set out at four o'clock in the evening with a negro, who carried my baggage. I stopped a moment in the hut of the brother of Sept Fonds, Xavier Clavier, an exile. This good anchorite awaited me with refreshments. He offered me his cell for the night, but I was in haste to set forward. He accompanied me nearly two leagues. He conversed with me of his projects—of his occupations. I saw his soul was as peaceable as the retreat he inhabited, and that he was a man submitting without ostentation, and with a religious resignation, to a destiny that the most sublime philosophy scarcely rendered supportable. When he quitted me I lost my way; my negro had gone on before: I had no compass; the night fell, and I knew not what direction to take in a thick wood where the paths crossed each other. I began to feel hunger and thirst; I measured the height of a tree; it was an asylum against the tigers, and I thought of passing the night there, when I was warned by the voice of a man, and by the noise of some poultry, that I was not far from the house where I was to sleep. There is no melody equal to the human voice to him who has feared to be alone and lost in a desert. I advanced, and met the Abbé Wagner, one of the exiles established here. He was driving the oxen and cows, and collecting them in the park. Perspiration, dust, and mud, prevented my knowing him. The abbé said to me, "They have given me hospitality unconditionally: I must show my gratitude by making myself useful."

The declining power of the governing party in France gave courage, not only for resistance in France, but in the colonies. The blacks, who had been emancipated by a decree of the convention, gave the governor of Cayenne an infinity of trouble. They would not work, and they would be paid. Burnel, entrusted with the government, saw but one mode of supporting his authority—viz. to excite the blacks against the whites, and the whites against the blacks. The colonists, thus menaced, took the remedy into their own hands, consulted the oldest heads in Cayenne, amongst which that of Marbois was numbered, and, guided by him and his companions, the Cayennese achieved a revolution, and deposed the governor on the 18th Brumaire (November 9), 1799. This was a singular coincidence; the executive directory being on the very same day dethroned by Bonaparte in the French capital. The old exiles could not but smile to find themselves yet revolutionising on the other side of the Atlantic, and proclaiming "insurrection to be the most sacred of duties." The governor was shipped off to France; and, although his employers had been driven from power at home, nevertheless the arrival of his successor was naturally looked to with some anxiety by the successful insurgent exiles.

At length, in January, 1800, this redoubted man, Victor Huques by name, arrived. It was not without trepidation that the exiles obeyed a summons to appear before him.

"'You remember,' said the new governor, 'that we have done business together before now.' The exiles replied, 'Not to their recollection.' 'Nevertheless, we have had contracts between us, and you were well contented with the performance of my part of the engagement. I fed you.' The exiles opened their eyes; when the new governor solved the enigma by saying, "I was the royal baker at Port-au-Prince, and I furnished the troops and the hospitals with bread.'"

The baker-governor was the bearer of humane instructions. The two exiles of Guiana were ordered to another depôt of political exiles at the Island of Oleron. There were Simeon, Boissy d'Anglas, Noailles, Villaret-Joyeuse. This was still imprisonment, but it was in sight of France, and no longer in a pestilential climate. It was under this impression of half-salvation that Marbois and his friend approached the coasts of France. The winds, and the English cruisers together, instead of allowing the vessel to proceed to Oleron, forced her into Brest; and there, instead of a prison, Marbois found the authorities rush in open arms to receive him. His old friend and schoolfellow, Le Brun, was one of the consuls, and Barbé Marbois was instantly restored, not only to liberty and to his possessions, but to increased fortune.

Relative Saline Quality of the Waters of the Atlantic and Mediterranean.—A remarkable proof of the relative degrees of salt held in solution by the waters of the Atlantic Ocean and the Mediterranean Sea, is afforded by the condition of the boilers of H. M. steam packet *Carron*, which has recently arrived at Woolwich after an attendance of a few months upon the fleet in the neighbourhood of Constantinople. Owing to the extensive impregnation with salt of the waters of the Mediterranean, it would appear that a deposit of solid salt, to the extent of one eighth part of an inch per diem, is found at the bottom of the boilers. This deposit is further stated to be greater in one week in the Mediterranean, than the entire deposit found in six months in the boilers of the steam packets which ply from Falmouth to Lisbon. In consequence of the extraordinary deposit of salt, it is found that the fuel carried out for feeding the furnaces, is exhausted much sooner, from the greater thickness of the solid medium between the water and the fire. The bottoms of the boilers also are much more rapidly destroyed by the heat. To remedy these inconveniences, no other method has yet been adopted than that of very frequently letting off the steam, for the purpose of cooling and opening the boiler for the removal of the saline incrustation by the hand. But, on the contrary, this operation is productive of an extraordinary loss of time, a period of sixty hours being generally required for the purpose, and this long detention occurring of necessity after a performance of only a few days. Therefore, so serious and peculiar a disadvantage to steam navigation, upon a sea which conducts us to so many great nations upon its shores, and even to all our possessions in the East, is well entitled to the consideration of the chemists and engineers of this country. The only chemical preparation which has as yet been attempted for the purpose of dissipating this saline deposit, has been found to have so corrosive an effect upon the metal of the boiler, that the remedy has proved to be worse than the disease.

From the Asiatic Journal.

THE BAR IN INDIA.

Sir S—— T——, the most irritable of God's creatures, under some malicious influence of his horoscope, was appointed advocate-general at Madras, from a snug obscure practice in the court of chancery. With too large a share of his own good opinion, he had been long laying up for himself a vast store of mortifications, that were for ever annoying him in after-life. The ship—that epitome of all the persecutions by which vanity can be tormented—the school where pride receives its most salutary lessons—that nest in which broods of annoyances are engendered from hour to hour—that Pandora's box without hope at its bottom—nearly fretted him to dissolution. During the whole of the voyage he was haunted by the furies of Orestes. The torments of Sisyphus, Ixion, and Tantalus, seemed combined to plague him. He occupied a portion of the round-house—that enviable part of the vessel under the poop, where the quacking of ducks and the cackling of fowls murdered his sleep so barbarously, that it was as much as poor Lady. T—— could do to prevent his running on deck naked. And then came the accursed saturnalia of passing the line. The fretful man might have been exempted from his share in the farce at the trifling expense of a little rum or tobacco. But he stood upon the *summum jus*. It seemed as if he had a constitutional point to defend—and he defended it most stoutly, till Neptune, seizing him in the midst of his argument, delivered him over without bail or mainprize to his myrmidons, who gave him a specimen of their *strigil* he did not soon forget.

It was most amusing to hear his squabbles with the captain on points of law—the skipper being one of that not uncommon marine race, who imagine that, to command a company's ship, implies the possession of a cyclopædia of all human knowledge. The lawyer was no match for him even on points of law; and, to make the comedy complete, the passengers always concurred with the captain. In short, T——, with his irritable nerves perpetually tortured by the ordinary noises of the ship, and frequently by the *extraordinary* ones invented for the purpose of plaguing him, led a terrible life of it. At Madras, something was for ever happening to disturb the knight's serenity. Precedence was a thorn in his side. Was a member of council's lady, untitled, to walk to the dining-room before his own, with a title? The question was sometimes warmly debated. "Pshaw!" said the civilian's lady, "what is a knighthood? My fishmonger received the distinction only a few days before I left England!" Such were the exasperations that fidgeted the poor advocate-general from morn to dewy eye. In court it was still worse. He could not get his witnesses to come to the point, or the interpreter never gave correctly what they swore. If he fell into a passion, his clients fared the worse for it. The council opposed to him took advantage of his infirmity by some intentional offence to his vanity, ever on the watch for affronts; and thus, with a cultivated mind, a thorough knowledge of his profession, and parts considerably above the average, he became almost useless to himself and to others; and in that hot climate, where petty vexations are real torments, the "o'er-informed tenement of clay" proved too feeble for the wear and tear of the temper that inhabited it.

There is this important distinction between the English and the Anglo-Indian bars—that, in the one, the presence of a numerous professional body, where, to use Gray's more than classical description of Westminster Hall,

> "togatum
> Æstuat agmen,"

is a perpetual check upon the intemperance of the judges; whereas, at the colonial bars, a restricted number of practitioners, and a most scanty attendance of auditors, suffer them to play their pranks with impunity. Nothing destroys the equilibrium of weak minds so much as judicial authority. In that office, insolence is sure to keep due pace with ignorance; nor is there a moral axiom more certain, than that the two qualities are always found to be in equal quantities. What stupid squabbles with the local governments, about jurisdiction and its boundaries, have been bubbling and boiling in the supreme courts, from time to time, since their first institution! The case of Moro Ragonath, in the Bombay court, was a fac-simile of a quarrel in the Calcutta court in 1776. Sir Edward West bequeathed his share in the dissension to Sir John Grant, whose notions of the omnipotence of his court were to the full as inflated as those of his predecessor. Grant was removed from his office after long discussions in the Privy Council.

But Sir Edward West was a thorn in the side of the company's civil servants, with about a score of whom he had contrived to quarrel—four grand juries in succession, consisting of European residents as respectable as himself—the editors of all the newspapers—and all the barristers of his own court. This person became recorder in 1823. In his first charge he flung out the most virulent censures upon his predecessors—arbitrarily dismissed from a high office in his court, an individual of the most unsullied integrity and splendid talents, the son-in-law of Sir James Mackintosh—and silenced the whole bar, the company's advocate-general included, for six months, because they presented a respectful memorial to him upon a case in which their own rights and the established practice of the court had been violated. He was a most indefatigable and accomplished scold, and richly deserved the *cucking-stool* awarded by the good old common-law of England to women of ungovernable tongues. The spiritless demeanour of the barristers, on the occasion just mentioned, was not very creditable to the profession, whose independence was wounded by that shameful abuse of authority.

In England, a hot-headed judge of this kind would be soon brought down to a cooler temperature. Not only is there the salutary restraint of a numerous bar, tinctured with the same learning, and tremblingly alive to their common professional honour, but there is a public out of doors, sitting as a court of review upon the con-

duct and opinions of the judges. In India there is no public. Some half dozen voices, faintly querulous like the chirping of grasshoppers in the fern, may be heard if any thing flagitious is done or attempted. But what is this to the roar of censure from the press, echoed from paper to paper, as thunder from hill to hill? It is this hourly cognisance of all that passes in our courts that keeps the judges to their good behaviour—and the wigs of five hundred barristers would bristle with indignation at such antics as were played by Sir Edward West upon his little bar at Bombay. In India, a barrister must lead an indifferent life of it, if the bench make what is called a dead set at him. It is true that instances of this kind have happened in Westminster Hall, though very rarely. Lord Kenyon had conceived a strong antipathy to Law (afterwards Lord Ellenborough), and Law made a most happy application of a passage in Virgil to this circumstance. Replying to a smart speech of Erskine, he perceived that Kenyon and the rest of the court manifested strong symptoms of being adverse to his client. "I fear not," he said, "the artful sophistries of my friend Mr. Erskine." Then, turning first to the counsel, and next to the judges, he exclaimed, with great emphasis,

"Non me tua fervida terrent
Dicta, ferox; Di me terrent, et (*looking at Kenyon*) JUPITER hostis."

And it is incalculable what mischief an insolent judge may do to an advocate in India. It matters little, in Westminster Hall, whether a man in full business be a favourite with the court or not. For many years the whole court of King's Bench set their faces against Marryatt, and treated him almost with personal contumely; yet he accumulated a vast fortune, and is supposed to have died the richest lawyer that England has known. Now, a hundredth part of the same systematic illiberality towards a member of the bar in India, would be death to him. The natives have a remarkably keen scent in these matters, and would not confide in him. They would act in conformity to a brief syllogism:—"Judge not give master sugar-words. Judge give sugar-words to court-lawyer on other side. Therefore master will lose cause." And a more helpless being than an unemployed counsel in India cannot be imagined. Let this be duly weighed by the English barrister before he pays his passage-money or bespeaks his outfit; for, if he sits with his hands before him, at Calcutta or Madras, with nothing to do but to gaze with listless vacancy on the figures of the lion and unicorn in the king's arms that hang over the bench, there is no other department into which he can thrust himself. In the mean time, he *must* live—though many would readily answer him, as Cardinal Richelieu answered the poet that satirized him, *je ne vois pas la necessité*;—and in that country, a mere subsistence absorbs what would be deemed a tolerable income at home. What then is to be done?

"Interea pereunt res et vadimonia fiunt."

He must run over head and ears in debt; and, in that climate, the anxieties of being in debt will bring him to the grave sooner than if the whole tribe of European maladies had beset him. Death has not prompter ministers in India than grief and despondency. It is no uncommon thing, and physiologists may explain it, for an individual there to sink under a twenty-four hours' fit of vexation.

Ponder this well, you that, stung with disappointment or sick with protracted hope, give from the back bench of the court to the daily-recurring question of the chief justice, "any thing to move, sir?" the daily-recurring reply, "nothing, my lord," and then return with a chilled heart and briefless pocket to your homeless chambers. Dream not of flying from the malice of fortune to the bar of India. No—hug your tattered gown to its last rag;—cobble and piece your shoes worn to the very *slither** by your weary pilgrimages to a thankless shrine. There is no man, that has not some snug corner in his mind to which hope retires and dreams of the future. A sudden gleam may break through the murky cloud that blackens your horizon—a lucky *kite*† may fall unexpectedly into your lap; or probably you have under your lee some kind friend to minister delicately and promptly to your need;—or a widow with a comfortable jointure may not be deaf to your vows. How absurd, then, to throw away all these smiling probabilities! To these may be added (taking it for granted you are a whig, and have bawled aloud for the reform bill), that there is a constant succession of commissions graciously provided by a whig government, as places of refuge for destitute barristers,—and may not one of these fall to your lot, and last you your lifetime, if you and your colleagues, after the fashion of commissioners, will but proceed slowly and leisurely in your duties? How much better all this, than to be baked in a hot land-wind with much fewer chances,—and instead of your fair and fat widow, with her appurtenances in the three per cents., to marry a lean, lisping, insipid creature, fitted out for the market with a ragged assortment of boarding-school accomplishments, and of linen from a ready-made shop, or turning up her thin nose at your pretensions, because you are not in the list of the *eligibles*.

Madras has, upon the whole, been better off for judges than Bombay; but once, at least, the Bombay bench was splendidly adorned. Sir James Mackintosh, a name dear to letters and philosophy, was no lawyer, in the narrow-minded sense of the word; he was more,—and, for a colonial judge, much better—for he was guided by the clear spirit of the law, which reflects a much brighter light than the twinkling taper of its letter. Mild and lenient almost to a defect in the administration of the criminal law (for there was but one instance of a capital punishment during his whole recordship), at *Nisi Prius* he was governed by those general principles of equity, which always lead to a right conclusion. The *books* might be against him; but the book of na-

† A stray brief, when the counsel is absent for whom it was intended.

ture, and the code antecedent to and superseding all special-pleading subtleties, were for him. He was lamentably thrown away on such a society as that of Bombay. Accustomed to lead in the conversations of the conversation men of the metropolis,—such as Sharpe, Rogers, Dumont,—he found himself transplanted amongst those who afforded a sad and bitter contrast. It was like Goëthe's oak-plant,* with its giant-fibres, compressed within the dimensions of a flower-pot. On the third day after his arrival, most forcibly was he reminded of the contrast, when one of the members of the council, the conversation turning upon quadrupeds, turned to him and enquired, what was a quadruped? It was the same sagacious Solomon (the writer has often heard Mackintosh relate the anecdote), who asked him for the loan of some book, in which he could find a good account of Julius Cæsar. Mackintosh jocosely took down a volume of Lord Clarendon's History of the Rebellion, in which mention is made of a Sir Julius Cæsar, master of the rolls in the time of Charles the First. The wiseacre actually took the book home with him, and after some days brought it back to Sir James, remarking that he was disappointed on finding that the book referred to Julius Cæsar only as a lawyer, without the slightest mention of his military exploits!

No exile ever deplored his lot more feelingly than Sir James Mackintosh. In a letter I received from him, after breathing some complaints of his banishment, he says;—"Turn to Cicero's Epistles. See how elaborately, and with what common-place topics, he consoles his friends, Trebatius, Sestius, Torranius, in their exiles. To another he says, *pro amore nostro, rogo atque oro, te colligas, virumque præbeas.* Yet, when it came to his own turn, see how effeminately he laments the loss of Rome, and the intercourses in which he lived there with the wise and accomplished ornaments of the state! My friends dole out the same consolations to me. Were they here, they would feel the insufficiency of all such topics to administer genuine consolation."

He was rendered for some time uncomfortable through his having given offence to the mercantile part of the Bombay community, by what they thought too rigid an interpretation of the orders in council then in force, having condemned a ship and cargo with costs; and their opinion of that adjudication was expressed without much delicacy or reserve. He was subject also to certain Parson Adams-like habits of forgetfulness of common things and lesser proprieties;—and this brought down upon him no slight share of taunt and ridicule. It happened, on his arrival at Bombay, that there was no house ready for his reception, and it would be a fortnight before a residence in the fort could be prepared for him. Mr. Jonathan Duncan, the governor of the presidency, therefore, with great kindness, offered his garden-house, called *Sans Pareil*, for the *temporary* accommodation of Sir James and his family. But months and months elapsed, till a twelvemonth had actually revolved; Mackintosh and his wife, during all this time, found themselves so comfortable in their quarters, that they forgot completely the limited tenure on which they held them, appearing by a singular illusion not to have the slightest suspicion of Mr. Duncan's proprietorship, notwithstanding some pretty intelligible hints on the subject from that gentleman, but communicated with his usual delicacy and politeness. At last, politeness and delicacy were out of the question, and the poor governor was driven to the necessity of taking forcible possession of his own property. This was partly indolence, partly absence of mind, on the part of Sir James. He was constitutionally averse to every sort of exertion, and especially that of quitting any place where he found himself comfortable. Before he went out to India, he made a trip into Scotland with his lady; and having taken up his abode for the night at an inn in Perthshire, not far from the beautiful park of the late Lord Melville, then Mr. Dundas, sent a request to Lady Jane Dundas (Mr. Dundas being absent) for permission to see the house and grounds, which was most civilly granted. Mr. Dundas being expected in the evening, her ladyship politely pressed them to stay to dinner, and to pass the night, their accommodations at the inn not being of the first description. Mr. Dundas returned the same day, and though their politics were as adverse as possible, was so charmed with the variety of Mackintosh's conversation, that he requested his guests to prolong their visit for two or three days. So liberal, however, was the interpretation they put upon the invitation, that the two or three days were protracted into as many months, during which every species of hint was most ineffectually given, till their hosts told them, with many polite apologies, that they expected visiters and a numerous retinue, and could therefore no longer accommodate Mr. and Mrs. Mackintosh.

These eccentricities were specks upon a most brilliant and estimable character, and they are such as have frequently been seen in the man of genius and letters. Nature is too thrifty in her gifts to heap all kinds of excellences in one shining mass, but like a skilful artist sobers her colours with shades and tints that soften without blackening the effect. Of these eccentricities, volumes might be collected;—but they are painful matters of remembrance to those who loved the kindness of his heart, and revered the depth of his knowledge. It is not, perhaps, generally known, that his *forte* was metaphysics. In societies, where he could be understood, he diffused himself over those perplexed subjects of enquiry, with an earnestness of expression and a warmth of eloquence, that showed the delight he took in them. Such was his perspicuity and powers of illustration, that they no longer seemed perplexed, but flowed from his lips as luminous and beautiful truths. In the very teeth of Locke and Condillac, he deduced the great maxims of moral philosophy from the moral sense inseparably connected with the structure of mind, and our natural perceptions of good and ill. Never were metaphysical hypotheses more clearly illustrated by the laws of our moral nature, than in the

* See his illustration of Shakspeare's Hamlet.

treatise which he published in the supplementary volume of the *Encyclopædia Britannica*. It will remain an enduring monument of perspicuity of argument and elegant discourse. Upon these subjects he was not only more consistent in his deductions, but more compressed and energetic in reasoning, than Dugald Stewart.

Well does the writer remember his lectures on the Law of Nature and Nations, delivered in Lincoln's-Inn Hall, in 1803. The preliminary discourse (now out of print, but well worth republishing) is a complete survey, as a great extent of country is viewed from a commanding eminence, of a vast and various subject. The sketch of Grotius is a perfect model of that kind of writing. Every body admires it as a specimen of eloquence, but as a discriminating and ingenious apology for the pedantry which it has been the fashion to object to that great jurist, its merits have been overlooked. The perpetual appeals of Grotius to the poets, philosophers, and dramatic writings of the ancients, are wont to appear to superficial thinkers superfluous as illustrations, and useless as authorities. Yet this multifarious citation from dramatists and poets was in strict subservience to his design, which was that of showing the *universal sense of mankind* as to the great principles of moral obligation. He appealed to the poets, because Æschylus, Sophocles, and Euripides, whose province was general nature, could not stray into the paradoxes in which philosophers bewilder themselves, but were tied down to the observance of those laws which govern the sympathies of mankind in all ages and countries. I cannot resist the temptation of transcribing the following passage:—

"So great is the uncertainty of posthumous reputation, and so liable is the fame, even of the greatest men, to be obscured by those new fashions of thinking and writing, which succeed each other so rapidly among polished nations, that Grotius, who filled so large a space in the eyes of his contemporaries, is now, perhaps, known to some of my readers only by name. Yet, if we fairly estimate both his endowments and his virtues, we may justly consider him as one of the most memorable men who have done honour to modern times. He combined the discharge of the most important duties of active and public life, with the attainment of that exact and various learning, which is generally the portion only of the recluse student. He was distinguished as an advocate and a magistrate, and he composed the most valuable works on the law of his own country; he was almost equally celebrated as an historian, a scholar, a poet, and a divine, a disinterested statesman, a philosophical lawyer, a patriot who united moderation with firmness, and a theologian who was taught candour by his learning. With singular merit and singular felicity, he preserved a life so blameless, that in times of the most furious civil and religious faction, the sagacity of fierce and acute adversaries was vainly exerted to discover a stain in his character. It was his fate to be exposed to the severest tests of human virtue; but such was the happy temperature of his mind, that he was too firm to be subdued by adversity, and too mild and honest to be provoked to violence by injustice. Amidst all the hard trials and galling vexations of a turbulent political life, he never once deserted his friends when they were unfortunate, nor insulted his enemies when they were weak. Unmerited exile did not damp his patriotism; the bitterness of controversy did not extinguish his charity. He was just even to his persecutors, and faithful to his ungrateful country."

Mackintosh's lectures at Lincoln's Hall were well attended. Canning never missed one of them. Romilly, Scarlett, Fonblanque, Richard Sharpe, Butler, were attentive listeners. Old Hargrave admired them, though fast asleep during the greater part of them. It is remarkable, that he made profuse acknowledgments to a voluminous work, then little read, and reposing undisturbed on the shelves of the booksellers, the Light of Nature,* by Search, a fictitious name assumed by Tucker. Of this book, the leading characteristic is its perpetual play of illustration from all subjects, high or low; the drawing-room and the kitchen, the parlour and the stable. The book rose instantly in price, and in a short time disappeared. But two or three of the most eloquent and impressive discourses were aimed at the refutation of Godwin's *Political Justice*,—a work abounding in moral paradoxes of the most revolting kind. I shall never forget the effect produced on his auditors, in spite of the most inharmonious of all accents and the most ungraceful of all manners, when he animadverted on that part of Godwin's book, which decried the moral beauty and obligation of gratitude. In fact, Godwin had the merit or the demerit of founding the modern school of Utilitarianism;—and Mackintosh's reasonings might be applied as an unanswerable Jeremy Benthamism of the present day. At this lecture, Godwin himself was present, and stood the fire with most unflinching fortitude.

During Sir James Mackintosh's recordership, a singular incident occurred. Two Dutchmen having sued for debt two British officers, Lieutenants Macguire and Cauty, these officers resolved to waylay and assault them. This was rather a resolve made in a drunken excitement, than a deliberate purpose. Fortunately, the Dutchmen pursued a different route from that which they had intended, and prosecuted the two officers for the offence of laying in wait with intent to murder. They were found guilty, and brought up for judgment. Previous to his pronouncing judgment, however, Sir James received an intimation that the prisoners had conceived the project of shooting him as he sat on the bench, and that one of them had for that purpose a loaded pistol in his writing-desk. It is remarkable that the intimation did not induce him to take some precautions to prevent its execution,—at any rate, not to expose himself needlessly to assassination. On the contrary, the circumstance only suggested the following remarks:—"I have been credibly informed, that you entertained the desperate project of destroying your own lives at that bar, after having previously destroyed the judge who now addresses you. If that murderous project had been executed, I should have been the first British judge who ever stained with his blood the seat of justice. But I can never die better than in the discharge of my duty." All this eloquence

* Published in 1776 in six volumes. It was republished in 1808, by the late Sir Harry Mildmay, the author's brother-in-law.

might have been spared. Macquire submitted to the judge's inspection of his writing-desk, and showed him that, though it contained two pistols, neither of them was charged. It is supposed to have been a hoax,—a highly mischievous one, indeed;—but the statement was *primâ facie* so improbable, that it was absurd to give it the slightest credence.

It is well known, that Sir James Mackintosh had contemplated a history of England, beginning with the revolution of 1688, down to the first events of the revolution in France. Such a work, conceived by a philosophical mind, and executed after much patient research by so complete a master of rhetoric, would have been an invaluable accession to that department of our literature. It is also well known that he had made considerable preparations for the task, having consulted many rare books, and the correspondence in particular of the English and French courts, deposited in the king's library at Paris. From these manuscripts, though Fox had beaten the ground before him, he would undoubtedly have extracted more ample illustration of the intrigues (nick-named policy) that preceded and followed that memorable event, than Dalrymple and Macpherson appear to have done with equal opportunities. But he listened to the syren-song of indolence; that master-vice of great minds overpowered his resolves, and though a vast affluence of materials surrounded him, and the most splendid remuneration was proposed to him by the Longmans, the diligent prosecution of it was deferred,*—and he accepted the recordership of Bombay. In the later period of his life, indeed, he supplied Dr. Lardner's *Cabinet Cyclopædia* with three volumes of a History of England, of which the first only seems to have received the deliberate touches of his hand. But that volume alone is by far the best commentary extant on the early constitution of England. As the work advances, it betrays instances of haste and inadvertence, which would probably have been avoided, had he written for fame rather than the exigency of the moment. If to what Sir James Mackintosh *did*, could be added what he *might have done*, he would deserve to be placed amongst the greatest men, who have done honour to polite letters. He was too fine and etherial a substance to work up into a lawyer,—certainly a working lawyer. It was quite amusing to see him conducting a *nisi-prius* cause, and addressing a common jury, on the Norfolk circuit. There was so innate a habit of generalisation in his mode of considering every question propounded to him, that he sometimes overlooked the details themselves from which that generalisation was deduced. He fired, therefore, over the heads of a jury, consisting chiefly of farmers, who, taking no cognisance of elevated and polished diction, were often at a loss to comprehend what he was talking about.

It is lamentable, that no biographical commemoration of Mackintosh has yet appeared, at least that deserves to be called so. But as I am admonished by the limits of this article, that the sketches I have already given may be deemed episodical, I return to Madras, and, Asmodeus-like, exhibit to the reader a character most dissimilar to that which has been just sketched. Sir F—— M——— succeeded to the vacancy on the bench of the supreme court, occasioned by the resignation of that amiable creature, Sir Benjamin Sullivan,—the most kind-hearted and hospitable of mankind. This Sir F—— M——— had acted as the Company's advocate at Calcutta, but had little or no employment except in his official capacity. He was generously bestowed upon Madras during the Castlereagh administration, his brother having been an obsequious follower of that nobleman during his critical secretaryship in Ireland. Through this channel,—no other reason for the appointment has ever been suggested,—he found himself on the seat of justice. Most unhappily, he arrived just after the discontent of the coast army had been extinguished, and when the minds of the misguided but honourable men, whom the pertinacious, self-willed policy of Barlow had goaded into it, had begun to be composed, and the amnesty of Lord Minto had restored something like the former state of tranquillity. Still there was the tossing and swell of the waves, as after a storm. It was at this juncture that he delivered his first charge to the grand jury—and though Lord Minto's amnesty had expressly deprecated all retrospective animadversion, M—— had the good taste and delicacy to call the gallant and high-minded officers, many of whom have since attained the highest honours of the service, *traitors and rebels*, not without a half-suppressed regret that they had not been convicted and punished for treason. What a specimen of judicial prudence! The charge did infinite mischief in the settlement. It unchained the animosities of party, and set families and individuals together by the ears,—undoing in effect all that had been done by a course of conciliatory and healing measures, wisely though too tardily adopted. Again friendships cooled,—divisions and factions intersected the whole surface of society, and the judge succeeded to the utmost extent of his wishes in making private life bitter.

Yet Sir F—— M——— was afterwards removed to the Calcutta bench, having kept the settlement in hot water for several months, by getting up addresses to Barlow after his recall, and proposing invidious toasts at public dinners, wantonly awakening the memory of past grievances, that were as yet imperfectly healed.

About this time, Sir Edmund Stanley arrived, as a puisne judge. Oh, for the pen of Fielding to trace the native humour, the genuine simplicity, the quaintness and oddity, of this excellent and amiable being! But as the mention of this well-

* He executed, it is true, some portion of it, but not for the public eye. It began with James the Second, but broke off at the transfer of the crown to the Prince of Orange. This has been published, with a continuation, resembling Sir James Mackintosh in manner and spirit as much as Freinshemius did Livy or Tacitus, whose last books he attempted to supply. The continuator professes himself to be one of those who undervalue the great transactions of the revolution. Peace be to such politicians! But it would have been as well, had he abstained from an attempt to continue a work, conceived by one who was avowedly and emphatically a whig of the revolution.

read lawyer, but at the same time a man the most credulous and ludicrously unversed in the affairs of common life, unfolds a series of anecdotes, and as much still remains to be said of the Anglo-Indian bar, which will be found, I trust, neither unamusing nor devoid of instruction, I reserve it as fitting matter for another chapter.

From the United Service Journal.

PIRATES AND PIRACY FROM THE EARLIEST AGES.

NO. III.—THE FLIBUSTEERS AND BUCCANEERS.

By the discovery of the new world, the Spaniards considered themselves in possession of a *treasure trove;* and rigidly interdicted the intrusion of other nations. British enterprise, however, was not to be baffled by Spain; and so early as 1517, to the high displeasure of the court of Madrid, an English armed vessel made a visit to Porto Rico and St. Domingo. This opened the way, and the French soon joined our countrymen in driving a trade with the several islands, although they were pronounced to be interlopers, and vessels were fitted against them called "guarda costas," whose commanders are said to have been ordered to "*take no prisoners.*" This drove the intruders to confederate; and the association thus originating in the West Indies, occasionally extended its operations to the Pacific Ocean, to the continual anxiety and terror of the Spaniards.

The French were the first who encroached upon the Spanish *rights*, by attempting to colonise, or rather to settle on shore, and the English soon followed. In 1625, and on the same day, these two nations established themselves on the island of St. Christopher's, in the name of their respective governments. They afterwards took the small island of Tortuga, as a necessary measure for the protection of those who procured provisions for them in Hispaniola, by the chase of wild cattle. From this time the cruising confederates were known as Flibusteers, the Flemish corruption of Freebooters, and their hunters were termed Buccaneers; but the distinction was soon lost, and though for some time they were under the favourite appellation of "Brethren of the Coast," they are generally renowned as a fraternity of "Buccaneers."

The name of Buccaneer, which originally signified one who dried or smoked flesh in the manner of the Indians, was given to the first French, or rather Norman settlers of St. Domingo, who hunted wild boars and beeves, in order to sell their flesh to their more settled neighbours, after it was dried on a raised hurdle over a slow fire—"*roti bien sec.*" They lived in huts built on patches of clear ground, called buccans, just sufficiently large to admit of drying the hides. The tenants of the buccans, having neither women nor children, congregated in parties, each keeping a servant, who, being a recent adventurer from Europe, was compelled to bind himself to some old buccaneer, in order to gain a footing in the country; more a companion, however, than a servant, the fruits of their labours were enjoyed in common; and, in cases of death, the domestic regularly succeeded to the property of the master. The life they led was sufficiently hard, and the employment of that nature that it is still common in Normandy to call a dirty smoky house "*un vrai boucan.*" Nor was it without danger, for they were continually at war with the Spaniards, who used every effort to extirpate them, and at length by continual massacres, drove them from that occupation to one in which they amply revenged upon that people the injuries sustained by their companions.

The Buccaneers, at first, seldom acted together, but in parties of from fifty to a hundred and fifty men each, embarked in open boats, ill adapted either to war, or security from the elements, and often in want of the first necessaries of life. Exposed to the intemperature of a pernicious climate, they alternately encountered the burning heat of a tropical sun by day, and the chilling damps of the night; and they added to these natural inconveniences, others arising from licentiousness. Averse to all the wholesome restraints which civilised men impose upon themselves for their common happiness, they spurned all authority, and wantoned in disorder. Like savages, having no apprehension of want, and taking no care to guard against famine by prudent economy, they were frequently exposed to all the extremities of hunger and thirst. But their enthusiasm seemed to kindle with distress, and inspired a courage that defied all danger. At the sight of a strange ship, their hardships were forgotten, and they usually boarded without deliberating about her force—to grapple was to conquer. They would attack the largest vessels, overpowering them with a desperate bravery which nothing could withstand. Thus they fought their way to riches and power. Every additional prize increased the means of capturing more—one happy chance produced twenty others, till at length the Spaniards, enervated by luxury and the quiet exercise of tyranny, were afraid of proceeding to sea.

The coasts which these brethren visited, in their more early incursions, were those of Cumana, Carthagena, Porto-Bello, Cuba, and New Spain, and those which bordered on the lakes of Maracaibo and Nicaragua. They seldom attacked outward-bound vessels, but confined their captures to ships sailing homewards from the Spanish colonies, because these were laden with treasure, and other materials of small compass and great value: they coveted not the bulky commodities of Europe, and suffered the vessels which bore them to pass unmolested. The success which crowned their expeditions soon increased their numbers: adventurers of all descriptions crowded around the standard of the "avengers of the murdered Americans;" and all were received without distinction of nation, religion, or language—except only the Spaniards, who were denied admission into the fraternity.

Although their vengeance was directed against Spain, their wealthiest and bitterest enemy, other nations were not exempted from their depredations. When distressed for men, money, or ships, almost every stranger became an enemy, and thus far they were pirates, though disdaining the im-

putation: they were wont to return thanks to God, with marked fervency, after each capture. No fixed laws guided their proceedings; these were made on the spur of occasion. But they had many binding customs which neophytes were bound to observe; and offences against the general good, such as peculation or treachery, were severely and summarily punished, either by death, by amputation of nose and ears, or by beaching, as they called exposing the culprit upon a desert island, without clothing or sustenance. Such was the certainty of punishment, or the sense of justice to each other, that few instances of this kind occurred. Every where the earliest history of this singular fraternity strongly verifies the adage of "faith among thieves;" for, though robbers by profession, none were ever more equitable among themselves: bolts, bars, and locks, and every species of fastening were prohibited, as the use of such securities would impeach the honour of their vocation. It was a crime punished by death to bring a woman or a young lad on board; and to desert an assigned post, incurred the same penalty.

A general right of participation in meals was acknowledged among them; and their dress was the slovenly attire used by those engaged in the buccan, particularly in unwashed shirts, and trowsers smeared with blood. The most perfect equality reigned in these floating communities, and their sense of independence was carried to such a length, that it was a rule of their order that each individual should indulge his inclination and caprice, regardless of the convenience of his fellows. Did any of the society require sleep and repose, they must bear without a murmur the attempts of their associates to debar them of the gratification. Whatever had the effect of calling forth courage, of putting patience to the test, of inuring to privations, and of giving exercise to strength, was to be borne without complaint. Hence their fidelity to each other, and the serenity with which they sustained hunger, thirst, and fatigue.

The resolutions of these extraordinary men were sudden and invariable. As soon as they gave their word they became irrevocably bound; and they frequently pledged it on the simple proposition of an expedition. The leader of an enterprise, commonly elected only for the occasion among the most distinguished for skill and courage, enjoyed more honours, but usually had no claim to greater emoluments than his associates, except what the general voice chose to award, when a cruise, from able conduct, proved profitable. Except in such an instance the booty was regularly divided into as many shares as there were men—none had a preference; every share was chosen by lot. The first distribution was in favour of the wounded, who had a daily pay for two months, and an allowance during cure; and if the funds were insufficient to fulfil this sacred obligation, the crew sallied out in quest of more spoil. This probity extended also to the dead; the companion or servant of a member killed received his share, under a custom which obtained of every Buccaneer's having a chosen and declared comrade, between whom property was common—a system called by the French *Matelotage*. If the deceased had no such companion, his proportion of plunder was disposed of according to will; or if he had made no will, it was carefully remitted to his family, or if they knew nothing of his relatives, it was distributed among the poor and to the churches, to pray for the repose of the dead, and apologise for misdeeds neither repented nor discontinued.

Such were the earlier customs of a society which, without revenue, cities, castles, or regular government, had become formidable to the greatest powers in Europe. But this mixture of discipline and insubordination, of wholesome laws and desperate expedients, was polished by several successive reforms; and when, after the English took the lead, the Buccaneers were assembled in larger bodies than had before acted in concert, a code of laws was introduced to regulate their conduct towards each other, which was rigorously enforced.

The Buccaneers seldom went on a cruise till they were "hard up" for money, resolving then to gain a victory which was essential to them. The dread of their very name generally paralysed resistance, and the surrender was immediate. If the prize was rich, they spared the lives of the crew; but otherwise would mangle, torment, and throw them overboard. When the booty was gained the divisions were made, and the next object was to spend it. At first, Tortuga was the general rendezvous of the freebooters; but an alliance between the English and French was not likely to continue for ever, and Jamaica commonly formed the resort of the former, and St. Domingo of the latter.

In these places they were sure of meeting with protection, of finding supplies for their wants, and every species of pleasure that was adapted to their gross manners. Here they lavished in debauches, as foolish as monstrous, all that they acquired by rapine and murder; and when the fruits of their cruises were thus dissipated, necessity drove them to the same desperate undertakings for further supplies. Immediately on their landing, tables covered with delicacies, strong liquors, play, music, and dancing, occupied all their time. Depraved women of all nations, and of all colours, induced by avarice and dissoluteness, constituted the principal charm, as well as the chief danger of these tumultuous orgies. "These pirates," says Exquemelin, "will spend two or three thousand pieces of eight in a night, not leaving themselves a good shirt to wear in the morning. I saw one of them give a common strumpet five hundred pieces of eight to see her naked. My own master would buy sometimes a pipe of wine, and placing it in the street, would force those that passed by to drink with him, threatening also to pistol them if they would not." Thus were squandered in a few weeks the treasures which cost long toil, all sorts of privations, much blood and many lives; but, as Raynal says, men who were uncertain of living to the next day, had little inducement to hoard.

That early success which attended the Buccaneers, was owing to the protection afforded them by the British and French governments. In

every war with Spain, each power readily furnished them with letters of marque. The flourishing state of Jamaica and St. Domingo first arose out of the depredations of these formidable ravagers; and but for their aid, the French settlements in the West Indies would have been crushed in their commencement. Thus supported, these associations continued, with few intermissions, for nearly two centuries, peace or war in Europe being of no import in the eyes of their leaders. The policy of the respective governments, Admiral Burney remarks, is well described in the following sentence:—"On lassait faire des avanturiers, qu'on pouvait toujours desavouer, mais dont les succès pouvaient être utiles."

In a short time, all the Spanish ships which appeared in the Caribbean seas were attacked and captured, whether they were great or small, armed or unarmed, and the Spaniards were compelled to make a temporary renunciation of commerce. They flattered themselves that thus the pirates, having no longer any prey which they could seize, would be reduced to inaction and their confederacy dissolved; but they soon found that they were deceived in their calculation. Weary of fruitless cruising, the Buccaneers resolved on making inroads upon land, which they were not long in accomplishing, to the serious cost of their distressed enemies, who had sunk into such cowardice, that they were beat even when they were in the proportion of twenty to one against the pirates. The adventures which followed this resolve, exhibit a series of stratagems and exploits which are almost without parallel; and the sufferings of the Spaniards strongly impressed the mind with a notion of the retributive justice of Providence. Strength of defence or remoteness of situation afforded no protection; and the assailants, strangers to every feeling of humanity, dealt misery upon the inhabitants of the cities of the Spanish Main, equaled only by that which was inflicted by their own ancestors on the unhappy and unprotected Indians. When they had pillaged, they set fire to the towns, and consumed whatever they did not carry away. The several species of torture to which they subjected their prisoners, in order to compel them to discover the places where they concealed their treasure, were such as savage bands alone are capable of resorting to; and of many of them decency forbids even the mention. At Puerto Cavallo—since so remarkable for the boarding of the Hermione—the tongues of a great number were taken out by the roots: and finally, all the inhabitants, except two, who were reserved as guides, were massacred.

One of the first continental expeditions was undertaken by a party of French and English, in 1654, who plundered Nueva Segovia. The history of this period abounds with relations of daring actions, stained by cruel ferocity; and the accounts given by the Buccaneers are so well authenticated as to leave no fact in doubt. We will therefore notice a few of the principal leaders of these hardy bands.

Pierre le Grand, a native of Dieppe, was one of the Flibusteers who obtained a renown in Europe, which, according to Voltaire, lasted more than forty years. This desperado sailed in a vessel without a gun, and having only twenty-eight men on board; and on the western coast of St. Domingo met with a Spanish man-of-war. The pirates, as soon as they perceived her, mutually swore to take her or to perish in the attempt, and advanced to her about sunset. They were armed only with swords and pistols; yet having scuttled their own bark, which they had scarcely time to quit before she sunk, they slew all who made any resistance, and rendered themselves masters of the vessel, which proved to be the vice-admiral of the Spanish galeons, homeward bound, with a rich freight.

Montbars was a young gentleman of Languedoc, whose mind, while a schoolboy, was so tormented by reading the barbarities of the Spaniards, that he fanatically resolved to avenge the miserable Indians. This spirit increased with his years; and scarcely had he become of age, when he expended the whole of his fortune in fitting out a vessel, and made common cause with the "Brethren of the Coast." He distinguished himself, by sea and land, as one of their most daring and skilful leaders. On the passage out, a Spanish ship being met with, was attacked, boarded, and taken—for the Buccaneers were rarely unsuccessful. Montbars led the way to the decks of the enemy, along which he carried wounds and death; and when submission terminated the contest, his only pleasure seemed to be to contemplate, not the treasures of the vessel, but the number of dead and dying Spaniards, against whom he had vowed a deep and eternal hatred, which he maintained during the whole of his life. Pillage and licentiousness had no charms for him—vengeance alone animated him. A Spaniard in arms never escaped his sword; and this ardour and implacability occasioned him to acquire the surname of "Exterminator."

So ferocious, however, were many of the marauders, that Montbars was not the most cruel of the enemies whom the Spaniards had to endure. A Dutchman, who, from having resided in the Brazils, was called Brasiliano, was fearfully eminent in brutal villany. This wretch actually commanded several of his prisoners to be roasted alive on wooden spits, "for not showing him hog-yards where he might steal swine." This would perhaps strike the perpetrators as inflicting a just retribution. Las Casas, speaking of the conquest of the New World, says, "I once beheld four or five chief Indians roasted alive at a slow fire; and as the miserable victims poured forth their dreadful yells, it disturbed the commandant in his siesta, and he sent an order that they should be strangled; but the officer on duty would not suffer it, but, causing their mouths to be gagged that their shrieks might not be heard, he stirred up the fire with his own hands, and roasted them deliberately till they all expired. I SAW IT MYSELF."

Another pirate of the same nation, called Francis Olonois, from having been born at Sable d'Olonne, near Basque Roads, had for a time a savage and successful career. From the situation of bondsman he raised himself to authority, and became so notorious, that, his ship being wrecked

upon the Spanish Main, and it being believed that he was killed with most of his crew, unbounded rejoicings took place among the Spaniards. It was true that he had been desperately wounded, and would have shared the fate of his companions, but for the stratagem of his mingling sand with the blood from his wounds, smearing his face therewith, and hiding himself dexterously among the slain. When the Spaniards quitted the field, he crawled into the woods, and tended his wounds till they were pretty well healed, when he took his way to Campeachy, disguised in a Spanish habit. In that town he found them exulting in his supposed death with bonfires and festivals, and was an eye-witness of the congratulations which took place on all sides at the end of so merciless a pirate. Here he enticed some slaves, under a promise of liberty, to steal a canoe and accompany him out to sea, and with their aid got safe to Tortuga. Being now too poor to fit out a proper vessel, he was obliged to push his fresh designs with a couple of small boats and twenty-two men. With these he stationed himself off the north coast of Cuba, with a view of boarding the first vessel that presented itself. The Governor of Havana, who could scarcely credit the resuscitation of the dreaded Olonois, sent a small frigate, mounting ten guns, to take the boats, and hang all the pirates, except the chief, who was to be tortured to death at head-quarters; and a negro executioner was embarked to officiate. The undaunted freebooter no sooner heard these tidings, and that the ship was at anchor in the river Estera, than he resolved to attack her. He accordingly boarded her so vigorously, that, after a sharp resistance, they were compelled to surrender, and, one by one, suffered the fate intended for his crew. Among the rest the black hangman appeared, and begged hard for his life; but, after making him confess the whole plot, his head rolled after the rest. One only was reserved to carry the news to the governor, and assure his excellency that should he fall into the marauder's hands, he should be similarly dealt with.

This exploit gained Olonois great credit, especially as he returned to Tortuga with a large and well-laden ship, which he took with his new frigate on the passage. He now compassed greater mischief, and, joined by the noted Michael de Basco, he put to sea, in 1667, with eight vessels and 650 men. At first he cruised off Hispaniola, where they captured two fine ships, which became a formidable addition to their squadron: one mounted sixteen guns, and had besides a cargo of cocoa, 40,000 pieces of eight, and the value of 10,000 more in jewels; the other was armed with eight guns, and 7000 weight of powder, some muskets, and 12,000 pieces of eight. Elated by success, the pirate now made for the devoted town of Maracaibo, a rich and populous place, "very pleasant to the view;" and having, after a sharp contest, stormed the fortress that commanded the bar at the entrance of the great lake, advanced and sacked the city. Part of the inhabitants made their escape to Gibralter, a town about forty leagues higher up the lake, with a great part of their effects. The remainder were doomed to undergo the atrocious and revolting cruelties of their merciless invaders. The rack and flames were in constant requisition; and while some of the Spaniards were being murdered in cold blood, Olonois, with his usual diabolical spirit, drew his cutlass and hacked one of them to pieces. Nor was this the worst act of this demon—for he cut open the breast of an unhappy captive, and tearing out the heart, actually gnawed it between his teeth with the ferocity of a wolf.

After the pirates had reveled fifteen days in Maracaibo, they resolved to follow up the blow by attacking Gibralter, where they imagined the Spaniards had concealed their wealth. This place was now defended by several batteries and 800 soldiers, nor had any thing been omitted which was calculated to oppose the progress of the invaders. The pirates were somewhat struck on seeing the preparations to receive them, and a council of war convened. But nothing could daunt the spirits of the Buccaneers, especially as they supposed all the riches of Maracaibo had been transported to Gibralter, so that they were unanimous for the attack: so far, however, was it considered hazardous, that they shook hands with each other, and swore to live or die together.

The advance was commenced, a desperate battle ensued, and the Spaniards, after fighting bravely, and losing nearly 500 slain, were compelled to retreat; of the pirates only 40 were killed, and about 80 wounded, who all died through the bad air. The hapless town was now entered by the inhuman conquerors; and brutality, lust, murder, robbery, and remorseless barbarity, had full swing. They then ransomed the two towns, for 30,000 pieces of eight, and 500 head of cattle, and after a stay of two months, took their departure, with a booty of 260,000 pieces of eight, and vast quantities of plate, linen, jewels, silks, and other articles. Among the spoil were the bells, images, and all the ornaments of the churches, with which the ravagers proposed to fit a chapel for themselves. After the dividend they returned to Tortuga, where the "common pirates," in three weeks, had scarcely any money left. "Thus," says the historian of their acts, "they made shift to lose and spend the riches they had got, in much less time than they were purchased: the taverns and stews, according to the custom of pirates, got the greatest part; so that soon after they were forced to seek more, by the same unlawful means they had got the former."

The career of Olonois was nearly closed, and we feel happy in adding, that the execrable wretch was taken, torn in pieces alive, and burnt to ashes by the Indians of the coast of Darien, where he had landed after a repulse. "Olonois," says Admiral Burney, "was possessed with an ambition to make himself renowned for being terrible. At one time, it is said, he put the whole crew of a Spanish ship, ninety men, to death, performing himself the office of executioner, by beheading them. He caused the crews of four other vessels to be thrown into the sea; and more than once, in his frenzies, he tore out the hearts of his victims, and devoured them."

The Buccaneers now became so formidable

from their numbers, that many Spanish towns submitted to pay them a contribution to avoid visits of such calamity and horror. The first land invader was an Englishman of the name of Lewis Scott, who sacked Campeachy, and obtained a large ransom to save it from the flames. Plunder, however, and not conquest, was the object of Scott; but after him, the chief in command, Mansvelt, happened to be a man of more policy and providence than any of his predecessors. He was equally popular with both French and English, and perceiving his opportunity, he determined to seize the occasion of forming an independent Buccaneer establishment. With this object in view, the isle of Sta. Catalina, on the Mosquito shore, was assaulted, carried, and garrisoned, about A. D. 1664. The death of Mansvelt shortly afterwards proved fatal to the design; for on his second in command, Henry Morgan, the son of a Welsh farmer, succeeding as head of the brethren, although he was partial to the notion of a stable establishment, yet his numerous expeditions interrupted the scheme. This renowned freebooter was a most capable and fortunate leader, though not so popular, because not so honest as his late commander. After attacking, carrying, and pillaging Puerto del Principe, the depot of the gold and silver from Mexico and Peru, in 1667, he conceived the bold project of subduing Porto Bello, one of the best fortified places in those regions. Without revealing his design to any person, and at the head of only 460 men, he suddenly surprised the town with no loss, the Spaniards being unprepared. In order to reduce the citadel, whither the most valuable property had been conveyed, he recurred to an artful expedient: he compelled the priests, nuns, and other women, whom he had made prisoners, to plant his scaling-ladders against the walls of the fortress, from a persuasion that the gallantry and superstition of the garrison would not suffer them to fire on the objects of their love and veneration. In this imagination, however, he was deceived. The governor used his utmost efforts to destroy every one that approached the works; so that Morgan was under the necessity of storming the place. Having succeeded, he opened a general sack; gaining, by the exercise of dreadful cruelties, a large booty in bullion, specie, and merchandise. Shortly afterwards, a large French Buccaneer ship refusing to join his command, Morgan dissembled his anger, and invited her captain and his officers to a carousal. Arriving on board, they were made prisoners, and their ship boarded; but she suddenly blew up, by which 350 Englishmen, and all the French prisoners, with the exception of thirty, perished in an instant.

In 1669, Morgan again sacked the unhappy towns of Maracaibo and Gibralter, with a large force, and exercised the most savage barbarities which even the bloody annals of these pirates recite: racks, cords, burning matches, and starvation, were not the worst of torments, and the soul sickens over the relation of those hellish atrocities. Here he remained so long rioting and plundering, that the Spaniards repaired the castle at the entrance of the great lake, and stationed three stout men-of-war in the "bocca" to cut off his retreat. This step somewhat disconcerted Morgan, as the largest of his ships mounted only fourteen guns, the rest were mere craft. Nevertheless, he concealed his apprehensions, and boldly sent to the Spanish admiral, threatening to destroy the town and slaughter all his prisoners, if the place was not forthwith ransomed, and his armament permitted to pass without molestation. The admiral resolutely refused the application, but offered a free passage on the pirate's surrendering all his booty and captures. Morgan and his associates deliberated; and they at length determined to risk any consequence rather than resign their spoils, which they had gained with so much peril. As the admiral adhered to his declared purpose, Morgan took measures for forcing the channel; and being a man of resources, he extricated his fleet and prizes from their difficult situation with admirable contrivance. He converted one of his vessels into a fire-ship by filling her with powder and combustibles, but so disguised with a row of *quakers*, as to resemble the most warlike of his squadron, while her decks being covered with blocks of wood with hats and caps on, completed the deception. By means of this ship, and a desperate fight, he defeated his floating enemies, taking one of the Spanish men-of-war, and destroying the two others. Still there remained the castle to be passed; and this was effected by another stratagem. During the day, Morgan filled his boats with armed men, and they rowed from the ships to a part of the shore which was well concealed from the castle by thickets. After waiting as long as might be supposed to be occupied in disembarking, all the men were concealed in the bottom of the boats, except two in each, who rowed them back again. This being repeated several times, caused the Spaniards to believe that the Buccaneers intended an assault by land with their whole force; and they disposed their cannon accordingly, leaving the sea-front of the castle unprovided. At night, Morgan's fleet took up their anchors with the first of the ebb, and without setting sail, it being moonlight, they dropped down. On arriving nearly opposite the castle, all canvass was crowded, a broadside was discharged at the fort, and before the garrison could return a shot, the pirates had escaped with a booty to the amount of 250,000 pieces of eight, and some ill-fated hostages for the ransom of Gibralter.

Morgan's reputation was now at the highest pitch, and though he was not personally beloved, the majority of the adventurers, who had increased to nearly 4000 men, recognised him as their commander-in-chief, on his summoning them to a general rendezvous off the west coast of Hispaniola, at the close of 1670; and many young men of family quitted Europe to solicit commands under him. His force amounted to thirty-seven ships, wherein were 2000 fighting men, beside the mariners. "The admiral hereof was mounted with twenty-two great guns, and six small ones of brass; the rest carried, some twenty, some eighteen, others sixteen, and the smallest at least four; besides which, they had great quantities of ammunition and fire-balls, with other inventions

of powder." With this formidable armament, as the West Indies could not furnish sufficient plunder for so many profligate and lawless ravagers, it was determined to attack Panama, as the wealthiest possible object.

As a measure of prudence, men were employed to hunt cattle and cure meat, and vessels were sent to collect maize. Here, also, Morgan drew up specific articles of agreement for the distribution of plunder, and had them subscribed to; for he was so little burthened with principle himself, that he suspected the good faith of every one, and was ever bent on checks and obligations. By these articles Morgan was to receive one hundredth of the whole booty; each captain was to have eight shares; provision was stipulated for the maimed and wounded; and rewards were appointed for those who should particularly distinguish themselves.

These preliminaries being arranged, the fleet sailed from Cape Tiburon on the 16th of December. Having again reduced the island of Sta. Catalina, by a secret understanding, of firing without shot, with the Spanish governor, who wished to have the honour, though not the danger, of resisting the rovers, Morgan sent a detachment under one Brodeley, to the mouth of the river Chagre, leading part of the way to his ultimate destination. Here was a strong fort situated upon a steep hill, and defended by an officer and a garrison worthy of the trust committed to their courage. The Buccaneers attacked it with desperation, and were as vigorously resisted; but this resistance only stimulated the energy of men accustomed, not merely to expect, but almost to command, success. It was again valiantly assaulted, and no less valiantly defended; and the assailants were nearly driven back a second time, when a powder-magazine exploded, and the breaches were mounted in the confusion. The governor of the fort, as well as some of his soldiers, refused quarter; and of 314 who composed the garrison, more than 200 were killed. The Buccaneers lost 100 killed, and 70 wounded.

Morgan made the prisoners repair the castle, and garrisoned it with 500 men. He also appointed 150 to take care of the ships; and having thus secured his retreat in case of adversity, he set forward, at the head of 1200 men, for Panama. They took advantage of the river as far as it was navigable, by embarking the artillery and stores in canoes; but the obstructions were so great, that it was not till the seventh day they arrived at Cruz, a village at the highest part of the Chagre to which boats can reach, and situated about eight leagues from the great city. The difficulties which they encountered were such as required the genuine Buccaneer hardihood to support. Their road led over rocks and mountains, and through almost impassable morasses, beset with concealed enemies, who killed some and wounded others. They were assailed with heat, cold, rain, and every variety of weather. Sometimes they were in such a state of starvation (for the supplies they expected to find in the villages had been carefully swept away by the Spaniards,) that a stray horse, or a mule, or an ass, became a delicious feast, without the trouble of cooking; and on one occasion, they made "a huge banquet" upon some bags of leather which they found in a deserted hut. On the ninth day of their journey the Buccaneers came within sight of the South Sea, a view which inspired such joy, that they sounded their trumpets, beat their drums, shouted, danced, and threw their caps in the air, with all the exultation of success, and proceeded direct for Panama, the steeples of which soon appeared in view. Early in the morning of the 27th of January, 1671, the march was resumed. The Spaniards, who had not been idle, determined, as the city was almost without defences, to oppose their progress by meeting the Buccaneers on the plain, where they showed such a front, that the latter, now reduced to fewer than one thousand, began to waver, till Morgan re-inspirited their courage by his valiant example. The President of Panama commanded 2000 infantry and 400 horse, and was provided with an immense number of wild bulls to break the enemy's ranks—but after two hours' desperate conflict was defeated, with a loss of 600 killed, and nearly double that number in wounded and prisoners. The Buccaneers were too much weakened and fatigued to pursue their advantage immediately; therefore, they halted to rest, after which, they undauntedly continued their march under a heavy fire of cannon charged with every description of destructive missile, which swept down numbers of men. Another contest of three hours took place, without intermission, during which neither party gave or received quarter, when the Spaniards were compelled to yield, and the noble city of Panama became the prize of the victors.

One of the first precautions taken by Morgan after his victory, was to prevent drunkenness among his men, to which end he procured to have it reported to him, that all the wine had been poisoned by the inhabitants. Before possession had well been taken, several parts of the city burst out into flames; but whether by accident, or by the policy of the Spaniards, or the contrivance of the arch-robber, is not known. Exquemelin lays the blame on Morgan, and Morgan retorted it on the inhabitants. Be this as it may, the calamity was regretted by all parties, and both Buccaneers and Spaniards united to stop the progress of the conflagration. But their efforts were vain, for the city consisted of about 7000 houses, principally built of cedar, "very curious and magnificent, and richly adorned," together with monasteries, churches, and public edifices, which continued to burn nearly a month, before the fire was totally extinguished,—a spectacle, no doubt, of terrible beauty and dreadful desolation.*

An odious scene of licentiousness, rapacity, and barbarity followed. No one was safe; those who fled by land were brought in and tortured by the detachments sent after them, while those who escaped to sea were overtaken by boats manned by the pirates; till Morgan, finding that some of his men were plotting to set themselves afloat in

* Among the buildings destroyed, was a factory-house, belonging to the Genoese, who then carried on the trade of supplying the Spaniards with slaves from Africa.

the South Sea, ordered the masts of a captured ship to be cut by the board, and all the small craft to be burnt. In the city, in boats, and in the neighbouring forests, were found vast treasures concealed in caves and cellars, besides immense quantities of valuable articles of commerce, which were destroyed. "In their cruelty," says Exquemelin, an eye-witness, in his narrative of the *Zee Rovers*, "no sex nor condition whatsoever was spared."

On the 24th of February, Morgan and his men quitted the ruins of the ill-fated Panama, driving before them 175 mules laden with booty, and 600 prisoners, some of whom were to carry burthens, and others to be ransomed. Among the latter were many women and children, who were made to suffer the extremes of hunger, thirst and fatigue, besides being kept in apprehension of being sold as slaves, that they might more earnestly endeavour to procure money to be brought for their ransom; and the brutal chief not only turned a deaf ear to their entreaties, but replied with sarcasm and mockery to their cries and lamentations. We must even give this devil his due, and admit that one fair action gleamed through the horrors of this excursion. A lady had charged "two religious persons" to procure the money for her ransom; which being obtained, they had misappropriated it. Captain Morgan enquired into the matter, and perceiving the villanous fraud, released the lady, and detained the two "religious men" in her stead. This was the more honourable as she was of great beauty, and had firmly resisted all the endeavours of Morgan, whose passions she inflamed, to ingratiate himself with her, even under threats of torture and death.

In the middle of the march back to Chagre, Morgan's habitual distrust of his companions, led him to draw up his men, and put them on their oaths, that they had not concealed any of the plunder, but had fairly thrown every thing into the common stock. Not satisfied with this, he also instituted a personal search, to the chagrin of the whole party, and especially of the French. On their arrival at Chagre, a division was made at the chief's dictum, of 200 pieces of eight to each man; a sum by no means satisfactory. Morgan, however, was not inclined to allay any discontent of this kind by an open reckoning; and to avoid further importunity, he relieved himself from the command; "which he did," says Exquemelin, "without calling any council, or bidding any one adieu; but went secretly on board his own ship, and put out to sea, without giving notice, followed by only three or four vessels out of the whole fleet, who, it is believed, went shares with him in the greatest part of the spoil." The French, who had never liked him, would willingly have revenged themselves upon him, had they, says the historian, "been able to encounter him."

Thus ended the piratical career of the crafty Morgan, who, it is said, realised one hundred thousand pounds. He certainly excelled all the other Buccaneer chiefs in the daring boldness of his plans, in the ability with which they were conducted, and in the address with which he extricated himself from the difficulties in which they involved him, and except Olonois, we might add, that he claims also a dreadful pre-eminence in the cruelties with which their execution was attended. Yet this monster was well received, knighted by his sovereign, and appointed a Commissioner of the Admiralty Court. Having fixed his residence at Jamaica, where he filled the most important posts, he enjoyed in security the wealth which had cost so many tears, and so much blood to the victims of his avarice, though it is supposed never to have excited the least remorse in his own hardened heart. This was not exactly the course which he had "chalked out" for himself, for on his arrival in Jamaica, he began to levy men with the view of settling in Santa Catalina, and holding it as his own; but Lord John Vaughan, determined to enforce our treaty with Spain, obliged him to relinquish his plan. In the autumn of 1680, in consequence of the Earl of Carlisle's quitting, from ill health, this lawless plunderer was left, as his deputy, to govern Jamaica! On assuming this high office, his administration was far from favourable to his old associates, some of whom suffered the extreme hardship of being tried and hanged under his authority; and one crew of Buccaneers, most of them English, who fell into his hands, he sent to be delivered up to the Spaniards, at Carthagena. His governorship lasted only a year, but he continued in office during the remainder of the reign of Charles II. In the next reign, the Court of Spain had the influence to get him sent home prisoner, and kept in confinement for three years. No charge being brought forward against him, he was then released, and passed his latter days in undeserved peace and tranquillity.

Songs of the Superstitions of Ireland. Music and Words by Samuel Lover, Esq.

We receive occasionally ballads and duets, but there has been lately such a dearth of music, properly so called, that we have given over our musical notices. When, however, we meet a genuine melody, we are neither so old nor so tasteless as not to relish it as it deserves. Mr. Lover has come before us in a new character: we have appreciated his traits and stories of the Irish peasantry for a very long time; we have admired the fidelity, the beautiful colouring, and the expression of his miniatures, and now we are called upon to testify of the sweetness of his poetry, and the skill and pathos of his musical compositions. We are tired of praising him,—and yet, in common honesty, we cannot help it. Mr. Lover has, indeed, a diversity of gifts, and excels in all, painter, poet, and musician; it is really too bad: if we encountered many such, "Othello's occupations" would be o'er.

Six of those songs of the superstitions of Ireland have come forth, and, we doubt not, they will be continued. When completed, we shall request Mr. Lover to publish them, with one of his own inimitable sketches to illustrate each; a sort of Irish musical annual, that would be sure to succeed.

THE STEAM EXCURSION.

Mr. Percy Noakes was a law-student inhabiting a set of chambers on the fourth floor, in one of those houses in Gray's-inn-square, which command an extensive view of the gardens, and their usual adjuncts—flaunting nursery-maids, and town-made children, with parenthetical legs. Mr. Percy Noakes was what is generally termed —"a devilish good fellow." He had a large circle of acquaintance, and seldom dined at his own expense. He used to talk politics to papas, flatter the vanity of mammas, do the amiable to their daughters, make pleasure engagements with their sons, and romp with the younger branches. Like those paragons of perfection, advertising footmen out of place, he was always "willing to make himself generally useful." If any old lady, whose son was in India, gave a ball, Mr. Percy Noakes was master of the ceremonies; if any young lady made a stolen match, Mr. Percy Noakes gave her away; if a juvenile wife presented her husband with a blooming cherub, Mr. Percy Noakes was either godfather or deputy godfather; and, if any member of a friend's family died, Mr. Percy Noakes was invariably to be seen in the second mourning coach, with a white handkerchief to his eyes, sobbing—to use his own appropriate and expressive description—"like winkin!"

It may readily be imagined that these numerous avocations were rather calculated to interfere with Mr. Percy Noakes's professional studies. Mr. Percy Noakes was perfectly aware of the fact, and he had, therefore, after mature reflection, made up his mind not to study at all—a laudable determination, to which he adhered in a most praiseworthy manner. His sitting-room presented a strange chaos of dress-gloves, boxing gloves, caricatures, albums, invitation cards, foils, cricket-bats, cardboard drawings, paste, gum, and fifty other extraordinary articles, heaped together in the strangest confusion. He was always making something for somebody, or planning some party of pleasure, which was his great *forte*. He invariably spoke with astonishing rapidity; was smart, spoffish, and eight-and-twenty.

"Splendid idea, 'pon my life,"—soliloquised Mr. Percy Noakes, over his morning's coffee, as his mind reverted to a suggestion which had been thrown out the previous night, by a lady at whose house he had spent the evening. "Glorious idea! —Mrs. Stubbs," cried the student, raising his voice.

"Yes, sir," replied a dirty old woman, with an inflamed countenance, emerging from the bedroom, with a barrel of dirt and cinders. This was the laundress. "Did you call, sir?"

"Oh! Mrs. Stubbs, I'm going out; if that tailor should call again you'd better say—you'd better say, I'm out of town, and shan't be back for a fortnight; and, if that bootman should come, tell him I've lost his address, or I'd have sent him that little amount; mind he writes it down; and if Mr. Hardy should call—you know Mr. Hardy?"——

"The funny gentleman, sir?"

"Ah! the funny gentleman. If Mr. Hardy should call, say I've gone to Mrs. Taunton's, about that water-party."

"Yes, sir."

"And if any fellow calls, and says he's come about a steamer, tell him to be here at five o'clock this afternoon, Mrs. Stubbs."

"Very well, sir."

Mr. Percy Noakes brushed his hat; whisked the crumbs off his inexplicables with a silk handkerchief, gave the ends of his hair a persuasive roll round his fore-finger, and sallied forth for Mrs. Taunton's domicile in Great Marlborough-street, where she and her daughters occupied the upper part of a house. She was a good-looking widow of fifty, with the form of a giantess, and the mind of a child. The pursuit of pleasure, and some means of killing time, appeared the sole end of her existence. She doated on her two daughters, who were as frivolous as herself.

A general exclamation of satisfaction hailed the arrival of Mr. Percy Noakes, who went through the ordinary salutations, and threw himself into an easy chair, near the ladies' worktable, with all the ease of a regularly established friend of the family. Mrs. Taunton was busily engaged in planting immense bright bows on every part of a smart cap on which it was possible to stick one; Miss Emily Taunton was making a watch-guard; and Miss Sophia was at the piano, practising a new song—poetry by the young officer, or the police officer, or the custom-house officer, or some equally interesting amateur.

"You good creature!" said Mrs. Taunton, addressing the gallant Percy. "You really are a good soul. You've come about the water-party, I know."

"I should rather suspect I had," replied Mr. Noakes, triumphantly. "Now come here, girls, and I'll tell you all about it." Miss Emily and Miss Sophia advanced to the table, with that ballet sort of step which some young ladies appear to think so fascinating—something between a skip and a canter.

"Now," continued Mr. Percy Noakes, "it seems to me that the best way will be to have a committee of ten, to make all the arrangements, and manage the whole set-out. Well, then, I propose that the expenses shall be paid by these ten fellows jointly."

"Excellent, indeed!" said Mrs. Taunton, who highly approved of this part of the arrangements.

"Then my plan is, that each of these ten fellows shall have the power of asking five people. There must be a meeting of the committee at my chambers, to make all the arrangements, and these people shall be then named; every member of the committee shall have the power of black-balling any one who is proposed, and one black-ball shall exclude that person. This will ensure our having a pleasant party, you know."

"What a manager you are!" interrupted Mrs. Taunton again.

"Charming!" said the lovely Emily.

"I never did!" ejaculated Sophia.

"Yes, I think it'll do," replied Mr. Percy Noakes, who was now quite in his element. "I think it'll do. Well, then, you know we shall go

down to the Nore and back, and have a regular, capital, cold dinner laid out in the cabin before we start, so that every thing may be ready, without any confusion; and we shall have the lunch laid out on deck in those little tea-garden-looking concerns by the paddle-boxes—I don't know what you call 'em. Then we shall hire a steamer expressly for our party, and a band, you know, and have the deck chalked, and we shall be able to dance quadrilles all day: and then whoever we know that's musical, you know, why they'll make themselves useful and agreeable—and—and—upon the whole I really hope we shall have a glorious day, you know."

The announcement of these arrangements was received with the utmost enthusiasm. Mrs. Taunton, Emily, and Sophia were loud in their praises.

"Well, but tell me, Percy," said Mrs. Taunton, "who are the ten gentlemen to be?"

"Oh! I know plenty of fellows who'll be delighted with the scheme," replied Mr. Percy Noakes; "of course we shall have"——

"Mr. Hardy," interrupted the servant, announcing a visiter. Miss Sophia and Miss Emily hastily assumed the most interesting attitudes that could be adopted on so short a notice.

"How are you?" said a stout gentleman of about forty, pausing at the door in the attitude of an awkward harlequin. This was Mr. Hardy, whom we have before described, on the authority of Mrs. Stubbs, as "the funny gentleman." He was an Astley Cooperish Joe Miller—a practical joker, immensely popular with married ladies, and a general favourite with young men. He was always engaged in some pleasure excursion or other, and delighted in getting somebody into a scrape on such occasions. He could sing comic songs; imitate hackney-coachman and fowls; play airs on his chin, and execute concertos on the Jew's harp. He always eat and drank most-immoderately, and was the bosom friend of Mr. Percy Noakes. He had a red face, a somewhat husky voice, and a tremendously loud laugh.

"How are you?" said this worthy, laughing, as if it was the finest joke in the world to make a morning call; and shaking hands with the ladies with as much vehemence as if their arms were so many pump-handles.

"You're just the very man I wanted," said Mr. Percy Noakes, who proceeded to explain the cause of his being in requisition.

"Ha! ha! ha!" shouted Hardy, after hearing the statement, and receiving a detailed account of the proposed excursion. "Oh, capital! glorious! What a day it will be! what fun! But, I say, when are you going to begin making the arrangement?"

"No time like the present—at once, if you please."

"Oh, charming!" cried the ladies. "Pray do."

Writing materials were laid before Mr. Percy Noakes, and the names of the different members of the committee were agreed on, after as much discussion between him and Mr. Hardy as if at least the fate of nations had depended on their appointment. It was then agreed that a meeting should take place at Mr. Percy Noakes's chambers on the ensuing Wednesday evening, at eight o'clock, and the visiters departed.

Wednesday evening arrived; eight o'clock came, and eight members of the committee were punctual in their attendance. Mr. Loggins, the solicitor, of Boswell-court, sent an excuse, and Mr. Samuel Briggs, the ditto of Furnival's Inn, sent his brother, much to his (the brother's) satisfaction, and greatly to the discomfiture of Mr. Percy Noakes. Between the Briggs and the Tauntons there existed a degree of implacable hatred, quite unprecedented. The animosity between the Montagues and Capulets was nothing to that which prevailed between these two illustrious houses. Mrs. Briggs was a widow, with three daughters and two sons; Mr. Samuel, the eldest, was an attorney, and Mr. Alexander, the youngest, was under definite articles to his brother. They resided in Portland-street, Oxford-street, and moved in the same orbit as the Tauntons—hence their mutual dislike. If the Miss Briggs's appeared in smart bonnets, the Tauntons eclipsed them with smarter. If Mrs. Taunton appeared in a cap of all the hues of the rainbow, Mrs. Briggs forthwith mounted a toque, with all the patterns of a kaleidescope. If Miss Sophia Taunton learnt a new song, two of the Miss Briggs's came out with a new duet. The Tauntons had once gained a temporary triumph with the assistance of a harp, but the Briggs's brought three guitars into the field, and effectually routed the enemy. In short, there was no end to the rivalry between them.

Now, as Mr. Samuel Briggs was a mere machine, a sort of self-acting legal walking-stick; and as the party was known to have originated, however remotely, with Mrs. Taunton, the female branches of the Briggs's family had arranged that Mr. Alexander should attend instead of his brother; and as the said Mr. Alexander was deservedly celebrated for possessing all the pertinacity of a bankruptcy-court attorney, combined with the obstinacy of that pleasing animal which browses upon the thistle—he required but little tuition. He was especially enjoined to make himself as disagreeable as possible; and, above all, to blackball the Tauntons at every hazard.

The proceedings of the evening were opened by Mr. Percy Noakes. After successfully urging upon the gentlemen present the propriety of their mixing some brandy-and-water, he briefly stated the objects of the meeting, and concluded by observing that the first step must be the selection of a chairman, necessarily possessing some arbitrary—he trusted not unconstitutional—powers, to whom the personal direction of the whole of the arrangements (subject to the approval of the committee) should be confided. A pale young gentleman, in a green stock, and spectacles of the same, a member of the honourable society of the Inner Temple, immediately rose for the purpose of proposing Mr. Percy Noakes. He had known him long, and this he would say, that a more honourable, a more excellent, or a better hearted fellow, never existed—(hear, hear). The young gentleman, who was a member of a debating society, took this opportunity of entering into an examination of the state of the English

law, from the days of William the Conqueror down to the present period; he briefly adverted to the code established by the ancient Druids; slightly glanced at the principles laid down by the Athenian law-givers; and concluded with a most glowing eulogium on pic-nics and constitutional rights. Mr. Alexander Briggs opposed the motion. He had the highest esteem for Mr. Percy Noakes as an individual, but he did consider that he ought not to be entrusted with these immense powers—(oh, oh!)—He believed that in the proposed capacity, Mr. Percy Noakes would not act fairly, impartially, or honourably; but he begged it to be distinctly understood, that he said this without the slightest disrespect. Mr. Hardy defended his honourable friend, in a voice rendered partially unintelligible by emotion and brandy-and-water; the proposition was put to the vote, and there appearing to be only one dissentient voice, Mr. Percy Noakes was declared duly elected, and took the chair accordingly.

The business of the meeting now proceeded with great rapidity. The chairman delivered in his estimate of the probable expense of the excursion, and every one present subscribed his proportion thereof. The question was put that "The Endeavour" be hired for the occasion; Mr. Alexander Briggs moved as an amendment that the word "Fly" be substituted for the word "Endeavour;" but after some debate consented to withdraw his opposition. The important ceremony of balloting then commenced. A tea-caddy was placed on a table in a dark corner of the apartment, and every one was provided with two backgammon-men, one black and one white.

The chairman with great solemnity then read the following list of the guests whom he proposed to introduce:—Mrs. Taunton and two daughters, Mr. Wizzle, Mr. Simson. The names were respectively balloted for, and Mrs. Taunton and daughters were declared to be black-balled. Mr. Percy Noakes and Mr. Hardy exchanged glances.

"Is your list prepared, Mr. Briggs?" enquired the chairman, with all the dignity of a minor Manners Sutton.

"It is," replied Alexander, delivering in the following:—"Mrs. Briggs and three daughters, Mr. Samuel Briggs." The previous ceremony was repeated, and Mrs. Briggs and three daughters were declared to be black-balled. Mr. Alexander Briggs looked rather foolish, and the remainder of the company appeared somewhat overawed by the mysterious nature of the proceedings.

The balloting proceeded; but one little circumstance which Mr. Percy Noakes had not originally foreseen, prevented the system working quite as well as he had anticipated—every body was black-balled. Mr. Alexander Briggs by way of retaliation exercised his power of exclusion in every instance, and the result was, that after three hours had been consumed in incessant balloting, the names of only three gentlemen were found to have been agreed to. In this dilemma what was to be done? either the whole plan must fall to the ground, or a compromise must be effected. The latter alternative was preferable; and Mr. Percy Noakes, therefore, proposed that the form of balloting should be dispensed with, and that every gentleman should merely be required to state whom he intended to bring. The proposal was readily acceded to; the Tauntons and the Briggs were reinstated, and the party was formed. The next Wednesday was fixed for the eventful day, and it was unanimously resolved that every member of the committee should wear a piece of blue sarsnet ribbon round his left arm. It appeared from the statement of Mr. Percy Noakes that the boat belonged to the General Steam Navigation Company, and was then lying off the Custom-house; and as he proposed that the dinner and wines should be provided by an eminent city purveyor, it was arranged that Mr. Percy Noakes should be on board by seven o'clock to superintend the arrangements, and that the remaining members of the committee, together with the company generally, should be expected to join her by nine o'clock. More brandy-and-water was despatched; several speeches were made by the different law students present; thanks were voted to the chairman, and the meeting separated.

The weather had been beautiful up to this period, and beautiful it continued to be. Sunday passed over, and Mr. Percy Noakes became unusually fidgetty—rushing constantly to and from the Steam Packet Wharf, to the astonishment of the clerks, and the great emolument of the Holborn cab-men. Tuesday arrived, and the anxiety of Mr. Percy Noakes knew no bounds; he was every instant running to the windows to look out for clouds; and Mr. Hardy astonished the whole square by practising a new comic song for the occasion in the chairman's chambers.

Uneasy were the slumbers of Mr. Percy Noakes that night: he tossed and tumbled about, and had confused dreams of steamers starting off and gigantic clocks with the hands pointing to a quarter past nine, and the ugly face of Mr. Alexander Briggs looking over the boat's side, and grinning as if in derision of his fruitless attempts to move. He made a violent effort to get on board, and awoke. The bright sun was shining cheerfully into the bed-room; and Mr. Percy Noakes started up for his watch, in the dreadful expectation of finding his worst dreams realised. It was just five o'clock: he calculated the time—he should be a good half-hour dressing himself; and as it was a lovely morning, and the tide would be then running down, he would walk leisurely to Strand Lane, and have a boat to the Custom House.

He dressed himself, took a hasty apology for a breakfast, and sallied forth. The streets looked as lonely and deserted as if they had been crowded over-night for the last time. Here and there an early apprentice, with quenched-looking, sleepy eyes, was taking down the shutters of a shop; and a policeman or milk-woman might occasionally be seen pacing slowly along; the servants had not yet begun to clean the doors, or light the fires, and London looked the picture of desolation. At the corner of a by-street, near Temple Bar, was stationed a "street breakfast." The coffee was boiling over a charcoal fire, and large slices of bread and butter were piled one upon the other,

like deals in a timber-yard. The company were seated on a form, which, with a view both to security and comfort, was placed against a neighbouring wall. Two young men, whose uproarious mirth and disordered dress bespoke the conviviality of the preceding evening, were treating three "ladies" and an Irish labourer. A little sweep was standing at a short distance, casting a longing eye at the tempting delicacies; and a policeman was watching the group from the opposite side of the street. The wan looks, and gaudy finery of the wretched, thinly clad females, contrasted as strangely with the gay sun-light, as did their forced merriment with the boisterous hilarity of the two young men, who now and then varied their amusements by "bonneting" the proprietor of this itinerant coffee house.

Mr. Percy Noakes walked briskly by, and when he turned down Strand-lane, and caught a glimpse of the glistening water, he thought that he had never felt so important or so happy in his life.

"Boat, sir!" cried one of the three watermen who were mopping out their boats, and all whistling different tunes. "Boat, sir!"

"No," replied Mr. Percy Noakes rather sharply, for the enquiry was not made in a manner at all suitable to his dignity.

"Would you prefer a wessel, sir?" enquired another, to the infinite delight of the "Jack-in-the-water."

Mr. Percy Noakes replied with a look of the most supreme contempt.

"Did you want to be put on board a steamer, sir?" enquired an old fireman-waterman very confidentially. He was dressed in a faded red suit, just the colour of the cover of a very old court-guide.

"Yes, make haste—the Endeavour; off the custom-house."

"Endeavour!" cried the man who had convulsed the 'Jack' before. "Vy, I seed the Endeavour go up half an hour ago."

"So did I," said another; "and I should think she'd gone down by this time, for she's a precious sight too full of ladies and gen'lmen."

Mr. Percy Noakes affected to disregard these representations, and stepped into the boat, which the old man, by dint of scrambling, and shoving, and grating, had brought up to the causeway. "Shove her off," cried Mr. Percy Noakes, and away the boat glided down the river, Mr. Percy Noakes seated on the recently mopped seat, and the waterman at the stairs offering to bet him any reasonable sum that he'd never reach the "Custum-us."

"Here she is, by Jove!" said the delighted Percy, as they ran alongside the Endeavour.

"Hold hard!" cried the steward over the side, and Mr. Percy Noakes jumped on board.

"Hope you'll find every thing as you wished it, sir—she looks uncommon well this morning."

"She does, indeed!" replied the manager, in a state of ecstacy which it is impossible to describe. The deck was scrubbed, and the seats were scrubbed, and there was a bench for the band, and a place for dancing, and a pile of camp stools, and an awning; and then Mr. Percy Noakes bustled down below, and there were the pastrycook's man, and the steward's wife laying out the dinner on two tables the whole length of the cabin; and then Mr. Percy Noakes took off his coat, and rushed backwards and forwards, doing nothing, but quite convinced he was assisting every body; and the steward's wife laughed till she cried, and Mr. Percy Noakes panted with the violence of his exertions. And then the bell at London-bridge wharf rang, and a Margate boat was just starting, and a Gravesend boat was just starting, and people shouted, and porters ran down the steps with luggage that would crush any men but porters; and sloping boards, with bits of wood nailed on them, were placed between the outside boat and the inside boat, and the passengers ran along them, and looked like so many fowls coming out of an area; and then the bell ceased, and the boards were taken away, and the boats started; and a great many people who wanted to go were left behind, and a great many people who didn't want to go were carried away: and the whole scene was one of the most delightful bustle and confusion that can be imagined.

The time wore on; half-past eight o'clock arrived; the pastry-cook's men went ashore; the dinner was completely laid out, and Mr. Percy Noakes locked the principal cabin, and put the key into his pocket, in order that it might be suddenly disclosed in all its magnificence to the eyes of the astonished company. The band came on board, and so did the wine. Ten minutes to nine, and the committee embarked in a body. There was Mr. Hardy in a blue jacket and waistcoat, white trowsers, silk stockings and pumps; habited in full aquatic costume, with a straw hat on his head, and an immense telescope under his arm; and there was the young gentleman with the green spectacles in nankeen inexplicables, with a ditto waistcoat and bright buttons, like the pictures of Paul—not the saint, but he of Virginia notoriety. The remainder of the committee, dressed as they were in white hats, light jackets, waistcoats and trowsers, looked something between waiters and West India planters.

Nine o'clock struck, and the company arrived in shoals. Mr. Samuel Briggs, Mrs. Briggs, and the Misses Briggs, made their appearance in a smart private wherry. The three guitars, in their respective dark green cases, were carefully stowed away in the bottom of the boat, accompanied by two immense portfolios of music, which it would take at least a week's incessant playing to get through. The Tauntons arrived at the same moment with more music, and a lion—a gentleman with a bass voice, and incipient red mustachios. The colours of the Taunton party were pink; those of the Brigg's a light blue. The Tauntons had artificial flowers in their bonnets; here the Briggs's gained a decided advantage—they wore feathers.

"How d'ye do, dear?" said the Misses Briggs to the Misses Tauntons. (The word "dear" among girls is frequently synonymous with "wretch.")

"Quite well, thank you, dear," replied the Misses Taunton, to the Misses Briggs—and then there was such a kissing, and congratulating,

and shaking of hands, as would induce one to suppose the two families were the best friends in the world, instead of each wishing the other overboard, as they most sincerely did.

Mr. Percy Noakes received the visiters, and bowed to the strange gentleman, as if he should like to know who he was. This was just what Mrs. Taunton wanted. Here was an opportunity to astonish the Briggs's.

"Oh! I beg your pardon," said the general of the Taunton party, with a careless air—"Captain Helves—Mr. Percy Noakes—Mrs. Briggs—Captain Helves."

Mr. Percy Noakes bowed very low; the gallant captain did the same with all due ferocity, and the Briggs's were clearly overcome.

"Our friend, Mr. Wizzle, being unfortunately prevented from coming," resumed Mrs. Taunton, "I did myself the pleasure of bringing the captain, whose musical talents I knew would be a great acquisition."

"In the name of the committee I have to thank you for doing so, and to offer you a most sincere welcome, sir," replied Percy (here the scraping was renewed). "But pray be seated—won't you walk aft? Captain, will you conduct Miss Taunton?—Miss Briggs, will you allow me?"

"Where could they have picked up that military man?" enquired Mrs. Briggs of Miss Kate Briggs, as they followed the little party.

"Can't imagine," replied Miss Kate, bursting with vexation; for the very fierce air with which the gallant captain regarded the company, had impressed her with a high sense of his importance.

Boat after boat came alongside, and guest after guest arrived. The invites had been excellently arranged; Mr. Percy Noakes having considered it as important that the number of young men should exactly tally with that of the young ladies, as that the quantity of knives on board should be in precise proportion to the forks.

"Now is every one on board?" enquired Mr. Percy Noakes. The committee (who with their bits of blue ribbon, looked as if they were all going to be bled) bustled about to ascertain the fact, and reported that they might safely start.

"Go on," cried the master of the boat from the top of one of the paddle-boxes.

"Go on," echoed the boy, who was stationed over the hatchway to pass the directions down to the engineer—and away went the vessel with that agreeable noise which is peculiar to steamers, and which is composed of a pleasant mixture of creaking, gushing, clanging, and snorting.

"Hoi—oi—oi—oi—oi—oi—o—i—i—i," shouted half-a-dozen voices from a boat about a quarter of a mile astern.

"Ease her," cried the captain; "do these people belong to us, sir?"

"Noakes," exclaimed Hardy, who had been looking at every object, far and near, through the large telescope; "it's the Fleetwoods and the Wakefields—and two children with them, by Jove."

"What a shame to bring children!" said every body, "how very inconsiderate!"

"I say, it would be a good joke to pretend not to see 'em, wouldn't it?" suggested Hardy, to the immense delight of the company generally. A council of war was hastily held, and it was resolved that the new comers should be taken on board, on Mr. Hardy's solemnly pledging himself to teaze the children during the whole of the day.

"Stop her," cried the captain.

"Stop her," repeated the boy; whizz went the steam, and all the young ladies, as in duty bound, screamed in concert. They were only appeased by the assurance of the martial Helves that the escape of steam consequent on the stopping of a vessel was seldom attended with any great loss of human life.

Two men ran to the side, and after a good deal of shouting, and swearing, and angling for the wherry with a boat-hook, Mr. Fleetwood, and Mrs. Fleetwood, and Master Fleetwood, and Mr. Wakefield, and Mrs. Wakefield, and Miss Wakefield, were safely deposited on the deck. The girl was about six years old; the boy about four; the former was dressed in a white frock with a pink sash, and a dog's-eared looking little spencer, a straw bonnet, and green veil, six inches by three and a half; the latter was attired for the occasion in a nankeen frock, between the bottom of which and the top of his plaid socks a considerable portion of two small mottled legs was discernible. He had a light blue cap with a gold band and tassel on his head, and a damp piece of gingerbread in his hand, with which he had slightly embossed his dear little countenance.

The boat once more started off; the band played "Off she goes," the major part of the company conversed cheerfully in groups, and the old gentlemen walked up and down the deck in pairs, as perseveringly and gravely as if they were doing a match against time for an immense stake. They ran briskly down the pool; the gentlemen pointed out the docks, the Thames police-office, and other elegant public edifices; and the young ladies exhibited a proper display of horror and bashfulness at the appearance of the coal-whippers, and ballast-heavers. Mr. Hardy told stories to the married ladies, at which they laughed very much in their pocket-handkerchiefs, and hit him on the knuckles with their fans, declaring him to be "a naughty man—a shocking creature"—and so forth; and Captain Helves gave slight descriptions of battles and duels, with a most bloodthirsty air, which made him the admiration of the women, and the envy of the men. Quadrilling commenced; Captain Helves danced one set with Miss Emily Taunton, and another set with Miss Sophia Taunton. Mrs. Taunton was in ecstacies. The victory appeared to be complete; but, alas! the inconstancy of man—having performed this necessary duty, he attached himself solely to Mis Julia Briggs, with whom he danced no less than three sets consecutively, and from whose side he evinced no intention of stirring for the remainder of the day.

Mr. Hardy having played one or two very brilliant fantasies on the Jew's harp, and having frequently repeated the exquisitely amusing joke of slily chalking a large cross on the back of some member of the committee, Mr. Percy Noakes expressed his hope that some of their musical

friends would oblige the company by a display of their abilities.

"Perhaps," he said in a very insinuating manner, "Captain Helves will oblige us." Mrs. Taunton's countenance lightened up, for the captain only sang duets, and couldn't sing them with any body but one of her daughters.

"Really," said that warlike individual, "I should be very happy, but——"

"Oh! pray do," cried all the young ladies.

"Miss Sophia, have you any objection to join in a duet?"

"Oh! not the slightest," returned the young lady, in a tone which clearly showed she had the greatest possible objection.

"Shall I accompany you, dear?" enquired one of the Miss Briggs, with the bland intention of spoiling the effect.

"Very much obliged to you, Miss Briggs," sharply retorted Mrs. Taunton, who saw through the manœuvre—"my daughters always sing without accompaniments."

"And without voices," tittered Mrs. Briggs, in a low tone.

"Perhaps," said Mrs. Taunton, reddening, for she guessed the tenor of the observation, though she had not heard it clearly. "Perhaps it would be as well for some people, if their voices were not quite as audible as they are to other people."

"And perhaps, if gentlemen, who are kidnapped to pay attention to some persons' daughters, had not sufficient discernment to pay attention to other persons' daughters," returned Mrs. Briggs, "some persons would not be so ready to display that ill-temper, which, thank God, distinguishes them from other persons."

"Persons!" ejaculated Mrs. Taunton.

"Yes; persons, ma'am," replied Mrs. Briggs.

"Insolence!"

"Creature!"

"Hush! hush!" interrupted Mr. Percy Noakes, who was one of the very few by whom this dialogue had been overheard. "Hush!—pray; silence for the duet."

After a great deal of preparatory crowing and humming, the captain began the following duet from the opera of Paul and Virginia, in that grunting tone in which a man gets down, Heaven knows where, without the remotest chance of ever getting up again. This, in private circles, is frequently designated "a bass voice."

"See (sung the captain) from o-cc-an ri—sing
Bright flames the or—b of da—y.
From yon gro—ve, the varied so—ngs—— "

Here the singer was interrupted by varied cries of the most dreadful description, proceeding from some grove in the immediate vicinity of the starboard paddle-box.

"My child!" screamed Mrs. Fleetwood. "My child! it is his voice—I know it."

Mr. Fleetwood, accompanied by several gentmen, here rushed to the quarter from whence the noise proceeded, and an exclamation of horror burst from the company; the general impression being, that the little innocent had either got his head in the water, or his legs in the machinery.

"What is the matter?" shouted the agonised father, as he returned with the child in his arms.

"Oh! oh! oh!" screamed the small sufferer again.

"What is the matter, dear?" enquired the father, once more—hastily stripping off the nankeen frock, for the purpose of ascertaining whether the child had one bone which was not smashed to pieces.

"Oh! oh!—I'm so frightened."

"What at, dear?—what at?" said the mother, soothing the sweet infant.

"Oh! he's been making such dreadful faces at me," cried the boy, relapsing into convulsions, at the bare recollection.

"He!—who?" cried every body, crowding round him.

"Oh!—him," replied the child, pointing at Hardy, who affected to be the most concerned of the whole group.

The real state of the case at once flashed upon the minds of all present, with the exception of the Fleetwoods and the Wakefields. The facetious Hardy, in fulfilment of his promise, had watched the child to a remote part of the vessel, and, by suddenly appearing before him with the most awful contortions of visage, had produced his paroxysm of terror. Of course, he now observed that it was hardly necessary for him to deny the accusation; and the unfortunate little victim was, accordingly, led below, after receiving sundry thumps on the head from both his parents, for having the wickedness to tell a story.

This little interruption having been adjusted, the captain resumed, and Miss Emily chimed in, in due course. The duet was loudly applauded; and, certainly, the perfect independence of the parties deserved great commendation. Miss Emily sung her part without the slightest reference to the captain, and the captain sang so loud that he had not the slightest idea of what was being done by his partner. After having gone through the last few eighteen or nineteen bars by himself, therefore, he acknowledged the plaudits of the circle with that air of self-denial which men always assume, when they think they have done something to astonish the company, though they don't exactly know what.

"Now," said Mr. Percy Noakes, who had just ascended from the fore-cabin, where he had been busily engaged in decanting the wine, "if the Misses Briggs will oblige us with something before dinner, I am sure we shall be very much delighted."

One of those hums of admiration followed the suggestion, which one frequently hears in society when nobody has the most distant notion of what he is expressing his approval of. The three Misses Briggs looked modestly at their mamma, and the mamma looked approvingly at her daughters, and Mrs. Taunton looked scornfully at all of them. The Misses Briggs asked for their guitars, and several gentlemen seriously damaged the cases in their anxiety to present them. Then there was a very interesting production of three little keys for the aforesaid cases, and a melo-dramatic expression of horror at finding a string broken; and a vast deal of screwing and tightening, and winding and tuning, during which Mrs. Briggs expatiated to those near her on the immense difficulty of playing a guitar, and hinted at the wondrous proficiency

of her daughters in that mystic art. Mrs. Taunton whispered to a neighbour that it was "quite sickening!" and the Misses Tauntons tried to look as if they knew how to play, but disdained to do so.

At length the Misses Briggs began in real earnest. It was a new Spanish composition for three voices and three guitars. The effect was electrical. All eyes were turned upon the captain, who was reported to have once passed through Spain with his regiment, and who, of course, must be well acquainted with the national music. He was in raptures. This was sufficient; the trio was encored—the applause was universal, and never had the Tauntons suffered such a complete defeat. Mrs. Taunton looked as philanthropic as one of Mr. Burnett's "Salamanders."

"Bravo! bravo!" ejaculated the captain;—"Bravo!"

"Pretty! isn't it, sir?" enquired Mr. Samuel Briggs, with the air of a self-satisfied showman. By the by, they were the first words he had been heard to utter since he left Boswell-court the evening before.

"De—lightful!" returned the captain, with a flourish, and a military cough;—"de—lightful!"

"Sweet instrument!" said an old gentleman with a bald head, who had been trying all the morning to look through a telescope, inside the glass of which Mr. Hardy had fixed a large black wafer.

"Did you ever hear a Portuguese tambourine?" enquired that jocular individual.

"Did *you* ever hear a tom-tom, sir?" sternly enquired the captain, who lost no opportunity of showing off his travels, real or pretended.

"A what?" asked Hardy, rather taken aback.

"A tom-tom."

"Never!"

"Nor a gum-gum?"

"Never!"

"What *is* a gum-gum?" eagerly enquired several young ladies.

"When I was in the East Indies," replied the captain, (here was a discovery—he had been in the East Indies!)—"when I was in the East Indies, I was once stopping several thousand miles up the country, on a visit to the house of a very particular friend of mine, Ram Chowdar Doss Azuph Al Bowlar—a devilish pleasant fellow. As we were enjoying our hookahs one evening in the cool verandah, in front of his villa, we were rather surprised by the sudden appearance of thirty-four of his kit-ma-gars (for he had rather a large establishment there,) accompanied by an equal number of Consumars, approaching the house with a threatening aspect, and beating a tom-tom. The ram started up"——

"The who?" enquired the bald gentleman, intensely interested.

"The Ram—Ram Chowdar"—

"Oh!" said the old gentleman, "I beg your pardon; it really did'nt occur to me; pray go on."

"—— Started up, and drew a pistol. 'Helves,' said he, 'my boy'—he always called me, my boy—'Helves,' said he, 'do you hear that tom-tom?'—'I do,' said I. His countenance, which before was pale, assumed a most frightful appearance; his whole visage was distorted, and his frame shaken by violent emotions. 'Do you see that gum-gum?' said he. 'No,' said I, staring about me. 'You don't?' said he. 'No, I'll be damned if I do,' said I; 'and what's more, I don't know what a gum-gum is,' said I. I really thought the man would have dropped. He drew me aside, and with an expression of agony I shall never forget, said in a low whisper—"

"Dinner's on the table, ladies," interrupted the steward's wife.

"Will you allow me?" said the captain, immediately suiting the action to the word, and escorting Miss Julia Briggs to the cabin, with as much ease as if he had finished the story.

"What an extraordinary circumstance!" ejaculated the same old gentleman, preserving his listening attitude.

"What a traveller!" said the young ladies.

"What a singular name!" exclaimed the gentlemen, rather confused by the coolness of the whole affair.

"I wish he had finished the story," said an old lady. "I wonder what a gum-gum really is?"

"By Jove!" exclaimed Hardy, who until now had been lost in utter amazement, "I don't know what it may be in India, but in England I think a gum-gum has very much the same meaning as a humbug."

"How illiberal! how envious!" said every body as they made for the cabin, fully impressed with a belief of the captain's amazing adventures. Helves was the sole lion for the remainder of the day—impudence and the marvellous are sure passports to any society.

The party had by this time reached their destination, and put about on their return home. The wind, which had been with them the whole day, was now directly in their teeth; the weather had become gradually more and more overcast; and the sky, water, and shore, were all of that dull, heavy, uniform lead-colour which house-painters daub in the first instance over a street door which is gradually approaching a state of convalescence. It had been "spitting" with rain for the last half hour, and it now began to pour in good earnest. The wind was freshening very fast, and the "jolly young waterman" at the wheel had unequivocally expressed his opinion that there would shortly be a squall. A slight emotion on the part of the vessel now and then, seemed to suggest the possibility of its pitching to a very uncomfortable extent in the event of its blowing harder; and every timber began to creak as if the boat were an overladen clothes basket. Sea-sickness, however, is like a belief in ghosts—every one entertains some misgivings on the subject, but few will acknowledge them. The majority of the company, therefore, endeavoured to look peculiarly happy, feeling all the while especially miserable.

"Don't it rain?" enquired the old gentleman before noticed, when, by dint of squeezing and jamming, they were all seated at table.

"I think it does—a little," replied Mr. Percy Noakes, who could hardly hear himself speak, in consequence of the pattering on the deck.

"Don't it blow?" enquired some one else.

"No—I don't think it does," responded Hardy, sincerely wishing that he could persuade himself

it did not, for he sat near the door, and was almost blown off his seat.

"It'll soon clear up," said Mr. Percy Noakes, in a cheerful tone.

"Oh, certainly," ejaculated the committee generally.

"No doubt of it," said the remainder of the company, whose attention was now pretty well engrossed by the serious business of eating, carving, taking wine, and so forth. The throbbing motion of the engine was but too perceptible. There was a large substantial cold boiled leg of mutton at the bottom of the table, shaking like blanc-mange; a hearty sirloin of beef looked as if it had been suddenly seized with the palsy; and some tongues, which were placed on dishes rather too large for them, were going through the most surprising evolutions, darting from side to side, and from end to end, like a fly in an inverted wine-glass. Then the sweets shook and trembled till it was quite impossible to help them, and people gave up the attempt in despair; and the pigeon-pies looked as if the birds, whose legs were stuck outside, were trying to get them in. The table vibrated and started like a feverish pulse, and the very legs were slightly convulsed—every thing was shaking and jarring. The beams in the roof of the cabin seemed as if they were put there for the sole purpose of giving people head-aches, and several elderly gentlemen became ill-tempered in consequence. As fast as the steward put the fire-irons up, they would fall down again; and the more the ladies and gentlemen tried to sit comfortably on their seats, the more the seats seemed to slide away from the ladies and gentlemen. Several ominous demands were made for small glasses of brandy, the countenances of the company gradually underwent the most extraordinary changes; and one gentleman was observed suddenly to rush from table without the slightest ostensible reason, and dart up the steps with incredible swiftness, thereby greatly damaging both himself and the steward, who happened to be coming down at the same moment.

The cloth was removed: the dessert was laid on the table, and the glasses were filled. The motion of the boat increased; several members of the party began to feel rather vague and misty, and looked as if they had only just got up. The young gentleman with the spectacles who had been in a fluctuating state for some time—one moment jolly, and another dismal, like a revolving light on the sea-coast—rashly announced his wish to propose a toast. After several ineffectual attempts to preserve his perpendicular, the young gentleman, having managed to hook himself to the centre leg of the table with his left hand, proceeded as follows:—

"Ladies and gentlemen. A gentleman is among us—I may say a stranger—(here some painful thought seemed to strike the orator; he paused, and looked extremely odd) whose talents, whose travels, whose cheerfulness"——

"I beg your pardon, Edkins," hastily interrupted Mr. Percy Noakes. "Hardy, what's the matter?"

"Nothing," replied the 'funny gentleman,' who had just life enough left to utter two consecutive syllables.

"Will you have some brandy?"

"No," replied Hardy, in a tone of great indignation, and looking about as comfortable as Temple Bar in a Scotish mist; "what should I want brandy for?"

"Will you go on deck?"

"No, I will not." This was said with a most determined air, and in a voice which might have been taken for an imitation of any thing; it was quite as much like a guinea-pig as a bassoon.

"I beg your pardon, Edkins," said the courteous Percy, "I thought our friend was ill. Pray go on."

A pause.

"Pray go on."

"Mr. Edkins *is* gone," cried somebody.

"I beg your pardon, sir," said the steward, running up to Mr. Percy Noakes, "I beg your pardon, sir, but the gentleman as just went on deck—him with the green spectacles—is uncommon bad to be sure; and the young man as played the wiolin says, that unless he has some brandy he can't answer for the consequences. He says he has a wife and two children, whose werry subsistence depends on his breaking a wessle, and that he expects to do so every moment. The flageolet's been werry ill, but he's better, only he's in such a dreadful prusperation."

All disguise was now useless; the company staggered on deck; the gentlemen tried to see nothing but the clouds; and the ladies, muffled up in such shawls and cloaks as they had brought with them, laid about on the seats and under the seats, in the most wretched condition. Never was such a blowing, and raining, and pitching, and tossing endured by a pleasure party before. Several remonstrances were sent down below on the subject of Master Fleetwood, but they were totally unheeded in consequence of the indisposition of his natural protectors. That interesting child screamed at the very top of his voice, until he had no voice left to scream with, and then Miss Wakefield began, and screamed for the remainder of the passage.

Mr. Hardy was observed some hours afterwards in an attitude which induced his friends to suppose that he was busily engaged in contemplating the beauties of the deep; they only regretted that his taste for the picturesque should lead him to remain so long in a position, very injurious at all times, but especially so to an individual labouring under a tendency of blood to the head. Having been for some months past subject to indigestion, and loss of appetite, he was recently persuaded to try a keener air and a more northern climate for the removal of the one, and the improvement of the other. We are credibly informed that he was present at the Edinburgh dinner, and, moreover, that he is the individual to whose eager appetite on that occasion we find allusion made in *The Morning Chronicle* of a few days since.

The party arrived off the Custom-house at about two o'clock on the Thursday morning—dispirited and worn out. The Tauntons were too ill to quarrel with the Briggs's, and the Briggs's were too wretched to annoy the Tauntons. One of the guitar cases was lost on its passage to a hackney-

coach, and Mrs. Briggs has not scrupled to state that the Tauntons bribed a porter to throw it down an area. Mr. Alexander Briggs opposes vote by ballot—he says from personal experience of its inefficacy; and Mr. Samuel Briggs, whenever he is asked to express his sentiments on the point, says that he has no opinion on that or any other subject.

Mr. Edkins—the young gentleman in the green spectacles—makes a speech on every occasion on which a speech can possibly be made, the eloquence of which can only be equaled by its length. In the event of his not being previously appointed to a judgeship, it is most probable that he will practise as a barrister in the New Central Criminal Court.

Captain Helves continued his attentions to Miss Julia Briggs, whom he might possibly have espoused, if it had not unfortunately happened that Mr. Samuel arrested him in the way of business, pursuant to instructions received from Messrs. Scroggins and Payne, whose town debts the gallant captain had condescended to collect, but whose accounts—with the indiscretion so peculiar to military minds—he had omitted to keep with that dull accuracy which custom has rendered necessary. Mrs. Taunton complains that she has been much deceived in him. He introduced himself to the family on board a Gravesend steam-packet, and certainly, therefore, ought to have proved respectable.

Mr. Percy Noakes is as light-hearted and careless as ever. We have described him as a general favourite in his private circle—we hope he may find a kindly disposed friend or two in public.

Boz.

FOUNDLINGS.

The "Revue Encyclopedique" gives some very interesting information relative to the children who are abandoned by their parents throughout France, and who are supported in the hospitals and other institutions of the country. The "Revue" states, that according to official accounts that have been made since the year 1819, the number of foundlings had increased from 99,346 to 122,981. The last number was during the year 1831, since which period no accounts have been made up. According to the law, the male children should be placed on board the vessels of the royal navy, but the captains are so averse to take them, on account of their birth, that but very few are employed in this manner. They are under the care of the nurses until they arrive at the age of twelve years, from which time, until they arrive at the age of majority, they are employed in the fields, and in various ways, but do not receive any salary for their labour. After the age of twenty-one, they are turned into the world to seek their own subsistence. According to the statistics of the mortality among these children, it appears that formerly nine died out of every ten before attaining the age of twelve years. At the present time the average is about one in three. In 1830, one hundred and ninety-eight died out of five hundred and ninety-three, who were admitted into the hospital of Montpelier. This amelioration is accounted for by the increased sum which has been allowed for the children's support, and likewise to the visits of the medical gentlemen who have by a recent regulation been appointed to that service.

From the New Monthly Magazine.

THE CONFESSIONS OF WM. SHAKSPEARE.

"With this key
Shakspeare unlock'd his heart."

About the year 1583, a license company of comedians was first formed in London by her majesty the queen. She was at that time in the fullest pride of her womanhood, and walked amid the gallant service of the Sidneys and the Raleighs. But the endowment of this company of poor players turned out, beyond all these, the most graceful feather in her cap. High fellows they were; poor as a queen's servants may be, but proud as creators of kings and queens have a good right to be. Poverty had no vulgar terrors to them. The strolling player in "Gil Blas," who soaks his dry crusts in the fresh spring by the road side, has been pointed to as a perfect picture of human felicity; yet theirs was far more perfect. They had always a spell in their wits, if not in their purses, to conjure up a cup of good wine with, and that is better than water. They drank it, and threw the lees away.

Now among these gentleman actors there happened to be several from Warwickshire. Richard Burbadge, their great tragedian—Thomas Green, their best comic actor and writer—Hart and Heminge—were all Warwickshire men. It may be supposed what a stir their new reputation must have made in their native county. Think of "no one being counted a gentleman that knows not Dick Burbadge!" What little emotions of ambition must not that have given birth to among the youths who heard of it! As for the women, no wonder it soon fell out that there was not "a countrywoman that could dance Sillenger's Round, but could talk of Dick Burbadge and Tom Green." But there were mightier results to follow. Green's native place was Stratford-upon-Avon, and at Stratford-upon-Avon young Shakspeare lived:—

"I prattled poesie in my nurse's arms;
And, born where late our Swan of Avon sung,
In Avon's streams we both of us have laved."*

As time passed, it had found the pleasant and light-hearted Green in deeper waters, through which his slight sail of mirth and wit was yet bearing him merrily. It is delightful to think that, as he then remembered his young townsman, and invited him to join the troop in London, he may have anticipated, with a beautiful unselfishness, the greater glories that greater genius would achieve. Suddenly, about the year 1586, William Shakspeare left his home at Stratford, his wife and his three infant children, and started for London alone—with what mighty, but indistinct, anticipations!

He joined the Blackfriar's theatre, and became an actor there. It is impossible to suppose that he had not now within his mind gleaming foreshadows of the creations with which he afterwards enriched and blessed the world. But their time was not yet come. His marvellous genius, which told him all things, told him to win his way quietly, modestly, unobtrusively. He offered to alter plays, to amend and rewrite scenes. One production was brought to him after another. Fancy the amazement of the poor original authors when their works came back with the touches of that divine hand! It soon fell out that plays altered by him had a surer market than plays written by others. Then sprang up envy, even in his modest and gentle way. "There is an upstart crow," says an ill-natured writer, alluding evidently to Shakspeare, "beautified with our feathers, that, with his tiger's heart, wrapped in a player's hide, supposes he is able to bombast out a blank verse as the best of you; and being an absolute Johannes Factotum, is, in his own conceit, the only Shake-scene in the country."

This was in 1591. His fellow-actors were now pre-

---

* A prologue spoken by Green.

pared for him. In 1593 he threw off the restraint of labouring for others, and burst out upon the town in the full plenitude of his own power and genius. What he was at the end he was at the beginning. His youth knew no imperfection; his more advanced years knew no decay. When the bowl indeed was broken, it was broken at the fountain. Never did such a career open upon any of the sons of men as now opened upon young Shakspeare. He did, indeed, shake every scene in the country; and the naked room of every theatre, with the rough blankets that hung therein for curtains, became, under his divine influence, "a field for monarchs"—and for creatures, greater than monarchs, whose majesties were destined to outlive all chances of the world, and whose glories could never grow dim. Every passion he subdued to his use; —all the vices and all the virtues stood plain before him;—the world of nature laid all her treasures at his feet;—the word of spirits revealed her most fantastic beauties and her deepest mysteries;—the oaks of Ardenne for him put on their green;—and at his bidding the circling spirits hovered round the ship in a tempest far at sea. But what seemed stranger than all, was the absence of all trace of "authorship" from these glorious writings. All the men of genius then had their separate characteristics. Shakspeare alone was universal. The various works of his contemporaries had always a certain personal stamp of style, and sometimes, through the shadow of imaginary forms, they painted but the secret workings of their own hearts. He alone stood above all reach of personal recognition. Like a god, and not "a man of our infirmity," he called forth A WORLD into separate existence, and set it spinning through the clear heaven of intellect, as one entire and perfect sphere of humanity. When its glorious creatures came successively in sight, men's thoughts were not of Shakspeare.

> "Oh wonder!
> How many goodly creatures are there here!
> How beauteous mankind is! O brave new world,
> That has such people in't!"

And the modest creator sat mean while, it might be, at the Mermaid, or fretted his hour upon the stage at Blackfriars, a gentle and unassuming man! I have the strongest assurance that we must take the very glory of Shakspeare's genius, its wonderful universality, as the secret of his own want of entire appreciation among his great contemporaries. For surely, beautiful as some of the tributes are that they have paid to him, they cannot have been paid as to the author of the works on which two centuries have set their seal as the rarest that ever came from man. Personal affection, as it seems to me, predominates in these tributes, rather than that higher feeling of reverent and loving homage which should have been his, and his alone. Else why, in addition to these, have we no personal records of the life of Shakspeare? No one cared to write about him even the scantiest records of his life, till the affectionate zeal of Betterton took him to Stratford, in the succeeding age, to make enquiries for the poet Rowe, who thereupon built up a biography, which Mr. Malone has laboriously thrown down—writing a large book about Shakspeare to prove that nothing can be written, and adducing whole troops and squadrons of facts to prove that no fact can be stated with certainty, except those momentous two which are furnished by the register of Stratford and authenticated by nature herself—that he was born and died. Nor, in saying this, do I mean to impute any reproach to the contemporaries of Shakspeare. Generosity is natural to the generosity and strength of genius; and I believe them to have been incapable of any mean or sordid jealousy. They are themselves a divine portion of the "sons of memory—the great heirs of fame," and have themselves bequeathed to us a legacy of beautiful and immortal thoughts. They are of the same brood with Shakspeare, though he stands among them more proudly eminent. My meaning simply is, that the genius which gave birth successively to Hamlet, to Falstaff, and to Lear, was too universal for personal reference. Men thought of nature, not of one of nature's children. All sense of admiration and wonder of the higher sort went to the great spirit of humanity of which these writings seemed the pure emanation; and the only tribute which found its way to Shakspeare was one of personal affection. His success, however, as a mere worldly matter, gave him of course a higher place in society; and he no longer visits the Mermaid and the Mitre as a poor player merely, but with the acceptance and esteem of a successful writer. It is characteristic to mark what Ben Jonson says: "I loved *the man*," is his first fervent expression. "I do honour to his memory on this side idolatry as much as any," is a nobler tribute, educed, however, by a counter reproach. He turns again, too, it will be noticed, instantly after, to the more personal attributes of Shakspeare. "He was indeed honest, and of an open and free nature, had an excellent fancy, brave notions, and gentle expressions, *wherein he flowed with that facility that sometimes it was necessary he should be stopped.*" The last touch is exquisite. It lets us into many a scene that must have occurred at the taverns then, and may now again be passing in the taverns of Elysium. The wit of Shakspeare must have proved too good a match for the learning of Ben! "It was necessary he should be stopped." We have no doubt of it.

"Many," says Fuller, "were the wit combats between him (Shakspeare) and Ben Jonson, which two I behold like a Spanish great galleon and an English man-of-war. Master Jonson (like the former) was built far higher in learning; solid, but slow in his performances. Shakspeare, like an English man-of-war, lesser in bulk, but lighter in sailing, would turn with all the tides, and take advantage of all winds, by the quickness of his wit and invention." This is a very lively picture, and makes us long for an earlier Boswell to that earlier and greater Jonson. As it is, however, we have some notion of the footing on which Shakspeare stood. A personal welcome to begin with, his wit to answer all the rest, and not a word from either side to intimate the divinity of his genius. No one "stands still with awful eye." It is hail fellow, well met—in the theatre alone men bowed before the agonies of Othello's passion, the sublime terrors of Macbeth's imagination—there alone they dreamt with the philosophic Hamlet over the riddle of life, to find in death the sole solution of its mystery! Is he who now enters the Mermaid with that light and buoyant step the author of these wonderful creations? Is that the demi-god of genius, the master of spirits and of men? See how he enters, unconscious of any superiority, and open and unassuming as a child. It is only as the wine stirs, and the potent Jonson gets rather dictatorial, that those quiet flashes of wit glance forth against him. We may suppose, in addition, the quiet under-current of satire, half pleasant, half scornful, which must have run through the mind of Shakspeare as he saw the younger poets turn to Jonson, as the great arbiter of their fate; waiting for his nod, as the sign of doom; and leaping for very joy in their hearts, as, out of that oracular chair of his—the town chair of poetry, wisdom, and scholarship—he pronounced them, with affectionate conceit, his "sons," and proceeded to "seal them of the tribe of Ben." But this ran, we dare be sworn, an under-current merely. It never ventured itself to the surface in the shape of severity or scorn. The more learned assumptions of Jonson were those, we are to suppose, he twitted him about, making all merry meanwhile, and adding to the sociality by his jests. It is by no means to be concluded from this that Shakspeare disrelished learning, or did not himself admit it in a gallant and airy spirit, and as a social

grace. It was only the Jonsonian shape of it he thought a fair subject for quizzing. Hear him speaking for himself at the Mitre in a happy vein of festive wit:—

"Give me a cup of rich Canary wine,
Which was the Mitre's once, and now is mine;
Of which, had Horace and Anacreon tasted,
Their lives as well as lines till now had lasted."

And the worthy Richard Jackson, whose manuscript hands this down to us, inserts a dramatic direction in the second line at the end of the fourth word—thus, "[drinks]" And so the life of Shakspeare passed—according to the chance records of the time. He wrote the mightiest works that have been given to man, and sought no personal association with them. He received none. As each of these works appeared, they merged, as it were, into the general and universal spirit to which they indeed of right belonged—the spirit of humanity. They became a portion of the great heart of the world. He, meanwhile, from whom they first proceeded, continued to walk through life's common way; laying on his heart the lowliest duties; assisting his fellow-actors to pass life merrily as they might; and—secure of the everlasting existence of those shapes of beauty he had sent into the world to be to it "joys for ever"—for himself, in the estimation of posterity, he betrayed no care. Mr. Lamb has said there is a magnanimity even in authorship. Is it not here? if the term of authorship can indeed be applied to Shakspeare. Posterity has certainly, in his case, taken care that nothing was lost by such noble modesty. Shakspeare is now only less than worshipped;—it is esteemed an honour to speak the tongue he spake;—and from the period of his death till now men have listened with untired ears to the music of his name, and have done little in their untired hearts but vary the music of his thoughts. *His* thoughts do we say? Which are his thoughts? Those of Hamlet? most like they may be! for, of all the characters in those immortal plays, Hamlet's intellect comes nearest to our notion of that which must have given them birth; and it seems rather meant to express the workings of an individual nature, the variations of an individual mind, a picture of moral unity, than to shadow forth the interest of general life, of passionate events or passion. But yet what assurance can we have that the thoughts of Hamlet are *his* thoughts—that those of Sir John Falstaff are not rather his—or that Lear may not yet more sternly feature forth the gigantic proportions of his immortal mind, and the little vexations of his mortal temper? Alas! say the commentators, we have none—no assurance can ever be had now for the enquiring mind of posterity. Alas! said Mr. George Chalmers, what a pity that we are not let into any of the secrets of Shakspeare's domesticity, his friendship, his amusements, his private character! Alas! echoes Mr. Steevens, it is indeed a pity; we know nothing of him but that he was born in Stratford, married, and had children, came to London and wrote plays, went back to Stratford, made his will, and died. Are you sure you know all that? shrewdly asks Mr. Malone, setting to work to sap the foundations of even the few facts we have. Oh, these commentators, how heavy they do lie upon Shakspeare! The earth, it is to be hoped, lies much lighter upon them.

Dear reader, believe not the commentators. I have suffered this illusion of questioning to be carried on too long in this brief paper. An emphatic answer could have been given earlier. Shakspeare himself *has* written of himself: Shakspeare himself *has* told of his loves and his friendships, and of those inner thoughts that alone stamp the character; Shakspeare himself has described the wayward moods of his mortal mind, and the wayward turns of his mortal fate; Shakspeare himself has unconsciously left for the world's gaze a picture, to contrast strangely, but in deep truth, with his glories of the theatre, and with his gaiety of the Mermaid and the Mitre; Shakspeare himself, from the sublime solitude into which the very might of his genius must ever and anon have plunged him, has sent forth audible sighs which are breathing still, and may still be heard amidst the throbbings of his mighty heart! Shakspeare, in one word, has written down his confessions, AND THESE CONFESSIONS STILL REMAIN.

It was, I find, about the year 1598 that an allusion first appeared in some writings of Shakspeare, undesigned for publication. In that year a book named "The Wit's Treasury" was published, written by one Meres, who indulged himself in an allusion to the poet after the following strain:—"As the soul of Euphorbus was thought to live in Pythagoras, so the sweet witty soul of Ovid lives in mellifluous and honey-tongued Shakspeare." Witness, Mr. Meres proceeded, startling greatly all who had not heard of them, witness "his sugared sonnets among his private friends."

Now in those days there lived a certain bookseller of doubtful authenticity, a sort of Edmund Curll, in truth, whose ungentlemanly transgressions beyond the honour of the business greatly shocked the sober Lintots and judicious Tonsons of the time. But Providence selects its instruments, and Mr. Jaggard has found favour with posterity. As soon as he saw this "note of Meres," he set to work to ferret out these sonnets, and scrape them together for a volume. He succeeded in collecting several, and published them accordingly, in defiance of the author and of all remonstrance, the following year. I fear he would scarcely have been incited to this but for some little matters of personal scandal that were in them, and for that the person whom they affected mainly was now becoming of some substance in the world, having just appeared as in part proprietor, as well as actor of the Globe theatre. This I gather from a curious document produced lately by the ingenious and learned Mr. Collier, in which the name of Shakspeare stands fifth in a list of the owners and actors of the Globe. It was not till 1609 that another publication of these sonnets took place, when a certain W. H., as I take it, performed the office of collector to those that had been written between that year and 1599, and carried the whole to Thomas Thorpe, who, in gratitude, dedicated the volume to his nameless benefactor.

These sonnets, then, are the PERSONAL CONFESSIONS of Shakspeare. They record his loves, his friendships, and his character, as I have already described them. They express (as it has been finely said the sonnet is fitted to express) "some fee grief due to the poet's breast;" they are sighs uttered from the fulness of his heart, which breathe forth its secretest emotions; they record the sweetest pieces of self-denial, and of jealous self-watchfulness; they tell us a variety of personal anecdotes of all sorts; they are, in short, transcripts of the writer's own mind in all its changes from joy to sorrow, and in the loftiest aspect of its intellect as in the lowliest of its daily fortunes. Into what wonderful secrets do they not admit us, what strange incidents do they not disclose! Think of the very inmost feelings of such a heart—of the depths of such a peculiar and solitary spirit, solitary in the very vastness of its sympathies! If the reader may find it worth his while to follow me, I venture to think that I am able to derive from these sonnets such a series of personal experiences, and such personal lessons of exquisite truth and wisdom, as it has rarely been permitted to man to breathe to himself, or to leave unconsciously on record to succeeding men. And how recorded! With what disinterested sentiment, what profound thought, what refinement, what love of nature! What glory does he not add to his thoughts of love, with what exquisite beauty does he not redeem his sorrows! They tell of obstacles, of severe struggles, of poverty, of contumely, of neglect—yet they are not dark with tears. For see,

beyond, even out of these splendid colours, these noble words, these lovely thoughts, the rainbow of hope springs up. At least the reader shall see it—if he will take me for his guide. I believe I have discovered many of the most hidden allusions in these poems, though there are many that must still remain impenetrable. For surely, in such a soul as that of Shakspeare, there must ever be unsounded abysses, which it would be but questionable philosophy to undertake very readily to fathom.

It shall be the object of a second paper to throw into succinct arrangement a most remarkable piece of autobiography (the most remarkable, perhaps, ever placed on distinct record), derived from these sonnets. Meanwhile, the space which remains shall be occupied with some remarks on a few of those thoughts and allusions that are in them, which I find explained even by the little that is known to us of the actual circumstances of Shakspeare's life. The most unbelieving of my readers may perhaps be content to exercise their reason, if not their faith, in arguing thus from the known to the unknown. It is proper perhaps to throw out this as a sop for Pagans, though it is not by any means for such as them that these pages are written.

The mention of these persons, however, reminds me to quote a passage of authority on the subject, from a very eminent writer, which may probably induce many most reasonable readers to follow me with a more implicit and confiding faith through the task I have undertaken. The quotation is due also in justice to the writer. The passage, I should remark, however, has only come under my notice since I began this article. Augustus William Schlegel, in his masterly criticisms on Shakspeare, remarks on the extraordinary deficiency of critical acumen in the commentators, that none of them, as far as he knows, have ever thought of availing themselves of his sonnets for tracing the history of his life. "These sonnets," proceeds that great critic, "paint most unequivocally the actual situation and sentiments of the poet, and they enable us to become acquainted with the passions of the man." I had not seen this passage when I began to write, but I am most proud to follow in the steps of so great an authority; one which will have the effect, too, I trust, of bringing along with me all the more scrupulous order of believers. The remark, however, strongly forces itself upon me, that the conduct of the commentators, in this matter, is less surprising than that Schlegel, having thus expressed himself, should stop here. It is easier to forgive the commentators than to forgive him. The excuse of ignorance is at least something, and the commentators have it on their side in its most emphatic form. When Mr. Steevens says that the strongest act of parliament, framed on purpose, would never compel people to read these sonnets, we cannot help thinking Mr. Steevens an idiot on that point, and treating him accordingly. When Schlegel employs the language we have just quoted, and fails to follow it up with a realisation of its own suggestion, we must even complain of Schlegel. He has left the task to very humble hands. What would we give to have seen it in his own!—that is now impossible. Above all, what would we not give, what sacrifices would we not make, to see it in the yet more Shakspearian hands of a countryman of our own—the deepest, the most apprehensive of critics—the noblest of humanists,—the purest, most modest, and most delightful of all prose writers—respected, admired, and loved Charles Lamb! *May that be possible still!**

As I write this, I have taken down a volume of Mr. Lamb's works, and opened on the following passage. It is the only one, I believe, in which he has alluded to the sonnets of Shakspeare; but it shows in how fine a spirit he would have treated the subject. I quote it for that reason, and because it has reference to one of the subjects I had intended to remark upon in concluding this paper. It occurs in the masterly essay on the tragedies of Shakspeare, considered with reference to their fitness for stage representation. (Works, vol. ii. p. 1.) Mr. Lamb is commenting indignantly on the circumstance of Garrick's having been called a kindred mind with Shakespeare's. "Did not Garrick shine, and was he not ambitious of shining, in every drawling tragedy that his wretched day produced—the productions of the Hills and the Murphys and the Browns—and shall he have that honour to dwell in our minds for ever as an inseparable concomitant with Shakspeare? A kindred mind! O who can read that affecting sonnet of Shakspeare which alludes to his profession as a player—

> "Oh, for my sake, do you with fortune chide,
> The guilty goddess of my harmful deeds,
> That did not better for my life provide
> Than public means which public manners breeds.
> Thence comes it that my name receives a brand;
> And almost thence my nature is subdued
> To what it works in, like the dyer's hand—"

Or that other confession—

> "Alas! 'tis true, I have gone here and there,
> And made myself a motley to the view:
> Gor'd mine own thoughts, sold cheap what is most dear—"

Who can read these instances of jealous self-watchfulness in our sweet Shakspeare, and dream of any congeniality between him, and one that, by every tradition of him, appears to have been as mere a player as ever existed?" These are, indeed, affecting passages which Mr. Lamb has quoted, and, with something of this sort, inexpressibly interesting and touching, the majority of the sonnets are burthened. What a thing it is to see a mighty and immortal poet, thus lighting to his individual existence on the common earth, and jostled by the mortal crowd! How touching, in all respects, are the circumstances! These two sonnets, I find, were published in Jaggard's first surreptitious collection, and must, therefore, have been written early; perhaps before he had thrown off any of his greater works, and while the dogs of necessity were still goading him on to common labours, already faded and panting in spirit from their worldly chase. But yet observe; he *performs* his duties—he plays at the theatre as usual—he does not shrink from that; he goes afterwards, perhaps, to the Mermaid or the Mitre, and keeps up the semblance of gaiety there—but the rack only stands still! In the solitude of his spirit, his spirit falls back upon itself, and its own mighty communings. I can fancy the horror with which the thought first crossed him, that as a mere task-worker he might cease to think his own thoughts—become subdued to the thoughts of others from daily working in them, and daily speaking them—and be at last unable to give forth those wonderful creations with the throes of which his breast must have been heaving them! There were moments when Raphael fancied himself no painter; there may have been moments when Shakspeare feared he could not write "Hamlet" or "Othello." The touching allusion, in the second sonnet, to his "goring" his own thoughts, and selling cheap "what is most dear," with the exquisite line which follows (omitted in Mr. Lamb's quotation),

> "Made old offences of affections new,"

seem to me to intimate that, whatever may have been his success as an actor with the audience, in impressing on *them* the meaning of the scene, he most assuredly went for his acting to the only sure source—his own heart.

* This hope is vain. As I correct these sheets I hear from one of his most honoured friends that that fine writer is no more.

Well might he say, he sold cheap what is most dear, since he "coined his heart for drachmas." His own thoughts he gored, that he might express the thoughts of others—his own affections, newly reaped, he turned into a harvest of profit for others, tampering with them, and changing them—and for what? How many shillings a week had Shakspeare for his acting?

But a more interesting question is, What sort of acting was it? I have a shrewd suspicion, from the evidences of these sonnets, and from other sources I will name, that it must have been fine—as far in advance, indeed, of his contemporaries and of his audience, as his writing was. At least, if this may not be conceded, Lingo's amusing plea will, perhaps, be allowed: "A scholar! I am a master of scholars!" Shakspeare was unquestionably, if not an actor, a master of actors. Witness his noble advice to the players in "Hamlet;" that admirable dialogue on acting and "playing the big tragedian," between Richard and Buckingham; and a thousand other evidences throughout his plays. But this is not all. The author of the "Roscius Anglicanus" distinctly states, on excellent authority, that Shakspeare himself specially taught Taylor to play Hamlet, and Lowin to play Henry the Eighth: he himself was content with the Ghost. Rowe says it was his top performance: and a noble performance I imagine it to have been. What a sense of the poetry, what an awful and most imaginative impressiveness must have been there! I would venture much that, as Taylor in Hamlet described the "piteous action" of Shakspeare in the Ghost, the audience must have felt, as it were humanly in their hearts, even that awful visitation. Another of his parts, too, known to have been acted by him, was that of Adam in "As you like it." How characteristic of the heart of the man (as the other had been of his imagination) to select this piece of beautiful and pathetic devotion! How sure a proof that he was equal to its noblest expressions! Aubrey distinctly states, indeed, that he "did act exceedingly well." I am very sure of it: but we have seen in what way his jealous self-watchfulness fancied acting might hurt his mind, and there may have been other reasons to disgust him with the profession. Honest John Davies, of Hereford, wrote to him jocosely,—

> "Some say, good Will, which I in sport do sing,
> Hadst thou not played some kingly parts in sport,
> Thou hadst been a companion for a king,
> And been a king among the meaner sort!"

but there was truth in this jest; and it is impossible to think that it can have other than revolted his fine nature to exhibit himself "a motley to the view" of the fops who, in those days, had the privilege of sitting on the stage; to be hustled perhaps, and impertinently addressed by a noble pimp of a fellow with his "tobacco-pipe in his mouth," in "a jerkin cudgeled with gold lace," with "a hat scarce pipkin high," and "a poniard on his thigh," as they are graphically described for us, sitting on the stage laughing, it might be, in the face of Macbeth or Lear. Add to all this the suggestion I began with—that his acting was probably in advance of his time. And what is an actor without applause? The war-horse without the trumpet. An actor must feel his living triumph, for but a slight one can survive him. At all events, Shakspeare seized the first opportunity of quitting the stage. In 1603 he played Sejanus in Ben Jonson's play: and this is the last date at which I find his name. When Volpone was acted, in 1605, his name does not appear. The truth is, that, in 1603 he appears, from the license dated in that year, to have accomplished the purchase of a larger share in the Globe theatre, and the first use he made of his new power was to take his own name from the list of actors!

I had intended to close this paper with some striking proofs of Shakspeare's strong sense of the immortality of his writings, but of the uncertainty of his own name surviving along with them,—a feeling I have already strongly insisted on as entertained, in some degree, by his contemporaries, and in these confessions of his thus strangely corroborated by himself. But I find that for the present I must conclude. My task has been no unpleasant one, and I trust I have found in the kindness of the reader some encouragement to proceed with it.

From the New Monthly Magazine.

THE BILLET DOUX.

BY L. E. L.

Yes! sweet letter, I will keep thee
Years—alas! it may be years;
Midnight's lonely hour shall steep thee
With the tenderest, truest tears.
'Tis his last—his farewell letter,
Doomed 'mid distant lands to rove;
He may find a brighter, better,
Never a more faithful love.

Yet to such vain fear replying,
When the days pass long and lone;
Still my heart, on his relying,
For his truth will pledge its own.
Ah! the love from childhood cherished
Links a sweet and household tie;
If such old affection perished,
All life's early hopes must die.

He will think, when summer weather
Lights some foreign forest glade,
How we used to roam together
In the greenwood's golden shade.
When strange flowers are round him blowing,
Purple in their eastern pride;
He'll recall the wild ones growing
By his native river's side.

On some stranger's hearth when gazing
With a home awakened heart,
He'll but see the wood fire blazing
Where we wont to sit apart.
All life's dearest links enthrall thee,
Wheresoever thou may'st roam;
Every thought that can recall me,
Must recall, too, youth and home.

Yes! I see the gliding motion
Of his vessel on the deep;
Oh, thou far and fearful ocean,
Carefully my loved one keep.
Ah, ye white sails slowly sweeping,
Like the wings of some vast bird,
Stay one moment for my weeping:
Let my last farewell be heard.

Tell him how each morning breathing
Shall my constant prayer ascend;
How the earliest flowers enwreathing,
I shall at our altar bend.
May St. Geneviève watch o'er him,
Every night I'll seek her shrine;
May she to his home restore him,
To a home that will be mine."

EPIGRAM

ON SIR JOHN ANSTRUTHER, A JUDGE.

Why is Sir John Anstruther Necessity's brother?
Necessity knows no law—no more does Anstruther.

From Blackwood's Magazine.

AUDUBON'S ORNITHOLOGICAL BIOGRAPHY.*

We were sitting, one night lately, all alone by ourselves, almost unconsciously eyeing the embers, fire without flame, in the many visioned grate, but at times aware of the symbols and emblems there beautifully built up, of the ongoings of human life, when a knocking, not loud but resolute, came to the front door, followed by the rustling thrill of the bell-wire, and then by a tinkling far below, too gentle to waken the house that continued to enjoy the undisturbed dream of its repose. At first we supposed it might be but some late home-going knight-errant from a feast of shells, in a mood, "between malice and true love," seeking to disquiet the slumbers of old Christopher, in expectation of seeing his night-cap (which he never wears) popped out of the window, and of hearing his voice (of which he is chary in the open air) simulating a scold upon the audacious sleep-breaker. So we benevolently laid back our head on our easy-chair, and pursued our speculations on the state of affairs in general —and more particularly on the floundering fall of that inexplicable people—the whigs. We had been wondering, and of our wondering found no end, what could have been their chief reasons for committing suicide. It appeared a case of very singular *felo-de-se*—for they had so timed the "rash act," as to excite strong suspicions in the public mind that his majesty had committed murder. Circumstances, however, had soon come to light, that proved to demonstration that the wretched ministry had laid violent hands on itself, and effected its purpose by strangulation. There—was the fatal black ring visible round the neck—though a mere thread; there—were the blood-shot eyes protruding from the sockets; there—the lip-biting teeth clenched in the last convulsions; and there—sorriest sight of all—was the ghastly suicidical smile, last relic of the laughter of despair. But the knocking would not leave the door—and listening to its character, we were assured that it came from the fist of a friend, who saw light through the chinks of the shutter, and knew, moreover, that we never put on the shroud of death's pleasant brother sleep, till "ae wee short hour ayont the twal," and often not till earliest cock-crow, which chanticleer utters somewhat drowsily, and then replaces his head beneath his wing, supported on one side by a partlet, on the other by a hen. So we gathered up our slippered feet from the rug, lamp in hand stalked along the lobbies, unchained and unlocked the oak which our faithful night porter Somnus had sported—and lo! a figure muffled up in a cloak, and furred like a Russ, who advanced familiarly into the hall, extended both hands, and then embracing us, bade God bless us, and pronounced, with somewhat of a foreign accent, the name in which we and the world rejoice—"Christopher North!" We were not slow in returning the hug fraternal—for who was it but the "American Woodsman?"—even Audubon himself—fresh from the Floridas—and breathing of the pure air of far-off Labrador!

Three years and upwards had fled since we had taken farewell of the illustrious ornithologist—on the same spot—at the same hour; and there was something ghost-like in such return of a dear friend from a distant region—almost as if from the land of spirits. It seemed as if the same moon again looked at us—but then she was wan and somewhat sad—now clear as a diamond, and all the starry heavens wore a smile. "Our words they were na mony feck"—but in less time than we have taken to write it—we two were sitting cheek by jowl, and hand in hand, by that essential fire—while we showed by our looks that we both felt, now they were over, that three years were but as one day! The cane coal-scuttle, instinct with spirit, beeted the fire of its own accord, without word or beck of ours, as if placed there by the hands of one of our wakeful Lares; in globe of purest crystal the Glenlivet shone; unasked the bright brass kettle began "to whisper its sweet under song;" and a centenary of the fairest oysters native to our isle turned towards us their languishing eyes, unseen the Nereid that had on the instant wafted them from the procreant cradle-beds of Prestonpans. Grace said, we drew in to supper, and hobnobbing, from elegant long-shank, down each naturalist's gullet graciously descended, with a gurgle, the mildest, the meekest, the very Moses of Ales.

Audubon, ere half an hour had elapsed, found an opportunity of telling us that he had never seen us in a higher state of preservation—and in a low voice whispered something about the eagle renewing his youth. We acknowledged the kindness by a remark on bold bright birds of passage that find the seasons obedient to their will, and wing their way through worlds still rejoicing in the perfect year. But too true friends were we not to be sincere in all we seriously said; and while Audubon confessed that he saw rather more plainly than when we parted the crow feet in the corners of our eyes, we did not deny that we saw in him an image of the Falco Leucocephalus, for that, looking on his "carum caput," it answered his own description of that "handsome and powerful bird," viz. "the general colour of the plumage above is dull hair-brown, the lower parts being deeply brown, broadly margined with grayish white." But here he corrected us; for "surely, my dear friend," quoth he, "you must admit I am a living specimen of the adult bird, and you remember my description of him in my first volume." And thus blending our gravities and our gaieties, we sat facing one another, each with his last oyster on the prong of his trident, which disappeared, like all mortal joys, between a smile and a sigh.

How similar, in much, our dispositions—yet in almost all how dissimilar our lives! Since last we parted, "we scarcely heard of half a mile from home"—he tanned by the suns and beaten by the storms of many latitudes—we like a ship laid up in ordinary, or anchored close in shore within the same sheltering bay—with sails unfurled and flags flying but for sake of show on

* Volume II. Edinburgh: Adam and Charles Black. London: Longman and Co. 1834.

some holyday—he like a ship that every morning had been dashing through a new world of waves —often close-reefed—or under bare poles—but oftener affronting the heavens with a whiter and swifter cloud than any hoisted by the combined fleets in the sky. And now, with canvass unrent, and masts unsprung, returned to the very buoy she left. Somewhat faded, indeed, in her appareling—but her hull sound as ever—not a speck of dry-rot in her timbers—her keel unscathed by rock—her cut-water yet sharp as new whetted scythe ere the mower renews his toil—her figure-head, that had so often looked out for squalls, now "patient as the brooding dove"—and her bowsprit—but let us man the main-brace; nor is there purer spirit, my trusty frere, in the old world or the new.

It was quite a Noctes. Audubon told us—by snatches—all his travels' history, with many an anecdote interspersed of the dwellers among the woods—bird, beast, and man. It was on the 1st of August, 1831, that he landed at New York, where he spent a few days only, and proceeded to Philadelphia. There he found his kind and firm friends, Harlan, (whom we lately had among us, and whom we knew how to honour,) Wetherell, Pickering, Sully, Norris, Walsh, and other worthies, "a few subscribers, and some diplomas." He had now two assistants, Mr. Ward from London, and a highly talented Swiss, Mr. Leman. At Washington he received from the heads of the government letters of assistance and protection along the frontiers, without which his researches would have been more arduous and less efficient; and all facilities were afforded to him by the president, and many members of the civil, military, and naval departments, who accorded to him whatever he desired at their hands. His fame in Britain had reached all ears in America; and it is our proud happiness to know, that the articles in Maga on his unequaled drawings and manifold merits contributed not a little to the spread of his reputation, having been republished there, and circulated in thousands and tens of thousands. "How pleasing was it," quoth he to us—and the words are now to be found in the introduction to his second volume, published this very day—"to me to find in our republic, young as she is, the promptitude to encourage science occasionally met with in other countries! Methinks I am now bidding adieu to the excellent men who so kindly received me, and am still feeling the pressure of their hands, indicative of a cordial wish for the success of my undertaking. May He who gave me being, and inspired me with a desire to study his wondrous works, grant me the means of proving to my country the devotedness with which I strive to render myself not unworthy of her." Down the broad Chesapeake Bay he proceeded to Norfolk, and thence in another steamer, to Richmond in Virginia, and thence to Charleston in South Carolina. He thus speaks, in his amiable introduction, of his reception there by a brother zoologist of high reputation, the Rev. John Bachman:—

"It was late in the afternoon when we took our lodgings in Charleston. Being fatigued, and having written the substance of my journey to my family, and delivered a letter to the Rev. Mr. Gilman, I retired to rest. At the first glimpse of day the following morning, my assistants and myself were already several miles from the city, commencing our search in the fields and woods, and having procured abundance of subjects both for the pencil and the scalpel, we returned home, covered with mud, and so accoutred as to draw towards us the attention of every person in the streets. As we approached the boarding-house, I observed a gentleman on horseback close to our door. He looked at me, came up, enquired if my name was Audubon, and on being answered in the affirmative, instantly leaped from his saddle, shook me most cordially by the hand—there is much to be expressed and understood by a shake of the hand—and questioned me in so kind a manner, that I for a while felt doubtful how to reply. At his urgent desire, I removed to his house, as did my assistants. Suitable apartments were assigned to us; and once introduced to the lovely and interesting group that composed his family, I seldom passed a day without enjoying their society. Servants, carriages, horses, and dogs were all at our command, and friends accompanied us to the woods and plantations, and formed parties for water excursions. Before I left Charleston, I was truly sensible of the noble and generous spirit of the hospitable Carolinians."

Having sailed for the Floridas, he was driven by adverse winds into a harbour near St. Simon's Island, where "he was so fortunate as to meet with Thomas Butler King, Esq., who, after replenishing his provision stores, subscribed to the 'Birds of America.'" In Florida he sojourned—not idle you may believe—during the winter of 1831-2, and on his return to Charleston passed through Savannah. At Charleston he lived with his friend Bachman, studying and scrutinising along with that enlightened man; and in April, 1832, went on board the revenue cutter "Marion," commanded by Robert Day, "to whose friendly attention I am greatly indebted for the success which I met with in my pursuits, during his cruise along the dangerous coast of East Florida, and amongst the islets that every where rise from the surface of the ocean, like gigantic water-lilies." At that "singular inland Indian Key" he met with every kind of assistance from the authorities; and having examined every part of the coast which it was the duty of the commander of the Marion to approach, "I returned to Charleston with my numerous prizes; and shortly afterwards I bent my course eastward, anxious to keep pace with the birds during their migrations." At Philadelphia (desolated by cholera) he was met by his family, and with them again proceeded to Boston.

"Boston! Ah! reader, my heart fails me when I think of the estimable friends whose society afforded me so much pleasure in that beautiful city, the Athens of our western world. Never, I fear, shall I have it in my power to return a tithe of the hospitality which was there shown towards us, or of the benevolence and generosity which we experienced, and which evidently came from the heart, without the slightest mixture of ostentation. Indeed, I must acknowledge, that although I have been happy in forming many valuable friendships in various parts of the world, all dearly cherished by me, the outpouring of kindness which I experienced at Boston far exceeded all that I have ever met with.

"Who that has visited that fair city, has not admired her site, her universities, her churches, her harbours, the pure morals of her people, the beautiful country around her, gladdened by glimpses of villas, each vying with

another in neatness and elegance? Who that has made his pilgrimage to her far famed Bunker's Hill, entered her not less celebrated Faneuil Hall, studied the history of her infancy, her progress, her indignant patriotism, her bloody strife, and her peaceful prosperity—that has moreover experienced, as I have done, the beneficence of her warm-hearted and amiable sons—and not felt his bosom glow with admiration and love? Think of her Adamses, her Perkins, her Everetts, her Peabodys, Cushings, Quinceys, Storeys, Paines, Greens, Tudors, and Davieses, whose public and private life presents all that we deem estimable, and let them be bright examples of what the citizens of a free land ought to be. But besides these honourable individuals whom I have taken the liberty of mentioning, many others I could speak of with delight, and one I would point out in particular, as he to whom my deepest gratitude is due, one whom I cannot omit mentioning, because, of all the good and the estimable, he it is whose remembrance is most dear to me:—that generous friend is George Parkman."

Leaving Boston he paid a visit to Moose Island, on which stands the last frontier town, boldly facing one of the entrances of the Bay of Fundy —"the climate was cold, but the hearts of the inhabitants of Eastport were warm"—and among them he found many friends. Having resolved to explore the British provinces of New Brunswick, he proceeded to St. John's, and ascending the river of that name, a most beautiful stream, passed a week at Frederickton, and thence higher up the river, below the "Great Falls," re-entered the territory of the United States. At length the day of his departure for Labrador arrived, "the wharf was crowded with all our friends and acquaintances, and as the 'the star-spangled banner' swiftly glided to the mast-head of our buoyant bark, we were surprised and gratified with a salute from the port that towers over the bay. As we passed the revenue cutter at anchor, her brave commander paid us the same honour." Through the Gut of Consso he launched into the broad waters of the Gulf of St. Lawrence, and visited the Magdalene Islands. Having passed the summer in the country of Labrador, on his return to the United States, he touched at Newfoundland, explored some of its woods and rivers, and landed at Pictou, in Nova Scotia. Once again at Boston, "the husband was in the arms of the wife"—they proceeded to New York—and then to Charleston, where he spent the winter, and then visited Baltimore. And after nearly three years of travel and research, behold Audubon again in Britain—with collections innumerable—"and an accession of sixty-three subscribers"—a list most honourable to the United States.

All this and more he told us, with a cheerful voice and animated eyes, while the dusky hours were noiselessly wheeling the chariot of night along the star-losing sky; and we too had something to tell him of our own home-loving obscurity, not ungladdened by studies sweet in the forest—till dawn yoked her dappled coursers for one single slow stage—and then jocund morn leaping up on the box, took the ribbons in her rosy fingers, and, after a dram of dew, blew her bugle, and drove like blazes right on towards the gates of day.

There is a flash of poetry for you—now for a bit of prose.

Before his departure from our shores, Audubon had carefully examined all his unpublished drawings, and since then has made fresh representations of more than a hundred objects which had been painted twenty years before. On his last rambles he has succeeded in obtaining species not known before, and some of those of which Charles Bonaparte and Alexander Wilson had only met with single specimens. In the Floridas and Carolinas he had ample opportunities of determining the numerous species of herons, ibises, pigeons, &c.; and one motive of his journey to Labrador, was to ascertain the summer plumage and mode of breeding of the water-birds, which in spring retire thither for the purpose of rearing their young in security, far from the haunts of man. Besides accomplishing that object, he met there with a few species hitherto undiscovered. Audubon wishes to do away with an erroneous impression received in some quarters, that his work on "The Birds of America" will not terminate till he has added to those of the United States the numerous species of the southern portion of the American continent. But it is stated truly in his prospectus, that his book will be completed in four volumes. He has, however, deviated from his original intention of first publishing *all* the land birds—and therefore volume third will contain the water birds—and in volume fourth he will return to the land birds—"all that remain unpublished, or that may in the mean time be discovered." In the first volume of his Illustrations, there are one hundred plates, and two hundred and forty figures of birds; in the second, the same number of plates, and two hundred and forty-four figures—the number of species in the two together, not described by Wilson, being forty-six. There are as great or greater blockheads, we are happy to know, in the old world, as in the new. Audubon tells us, that shortly after the death of Wilson, one of the wise men of a certain city in the United States (he ought to have given us his name) assured the members of a Natural History Society there, that no more birds could be found in the country than had been described by that celebrated writer. "No more finches," said the orator; "no more hawks, no more owls, no more herons, and certainly no more pigeons; and as to water birds, let the list given by Wilson, of such as he has not described, be filled, and again I say, there will end the American ornithology." We have no blockhead equal in magnitude to this, by many feet. He is the Gog and Magog of mundane blockheads—a giant in these days that dwindles the old Terrène. If his bulk yet burden the land,

"That sees th' Atlantic wave its morn restore,"

will he please to puzzle his pate with this poser—which we find puzzles even Audubon, and eke Wilson. How happens it that there are now in the United States so many birds which, not more than twenty years ago, were no where to be found in these countries? That birds should thus suddenly make their appearance, and at once diffuse themselves over almost the whole of the country, is a fact that must bother the brains of Gog and Magog. "Were similar changes," adds Audubon, "to take place in the other tribes of animals,

and in other countries, the arrangements of systematic writers would have to undergo similar revolutions, a circumstance which would tend to add to the confusion arising from continual shiftings, combinations, disseverings, abrasions of names, and alterations of method, *which the interpreters of nature are pleased to dignify with the name of science.*"

We like the lines in Italics. But to return to Gog and Magog. "He afterwards traveled much," quoth Audubon slyly, "having gone a few miles to the eastward of his city, and even crossed the Mississippi; but, as he had predicted, not even *he* discovered a bird in all his wanderings." But, following in the track of Wilson, other industrious students of nature ransacked the recesses of the forests, and the great western plains, the shores of the Atlantic, all the rivers and lakes that glorify America, and "they have found more new birds than the learned academician probably knew of old ones." Audubon rejoices to mention the names of those who have augmented the Fauna of the United States—the Bonapartes, the Nuttals, the Bachmans, the Coopers, the Pickerings, the Townsends, and the Peales; and to that list he adds the names "of learned and enterprising Europeans, Parry, Franklin, Richardson, Ross, and Drummond, who, with a zeal equaled only by that of Wilson himself, have crossed the broad Atlantic, and made discoveries in ornithology in portions of North America never before visited, in which they have met with species, that, although previously unknown to us, have since been found to traverse the whole extent of our wild territories. Then, reader, will you not agree with me in believing, that, even now, discoveries remain to be made in a region so vast, that no individual, whatever might have been his exertions, could truly say of it, that he had explored it all?" Audubon follows the nomenclature of Charles Lucien Bonaparte; he intends, at the close, to present a general table, exhibiting the geographical distribution of the different species—and to offer his ideas on the subject of grouping and affinities. The number of the "Birds of America"—for sometime back engraved—excellently well—by Havel—have appeared with a regularity seldom observed in so large a publication, and no doubt will continue to do so; but the magnificent work will not be brought to a close for two or three years—not till Audubon—now in London—has returned from his projected visit to the shores of the Pacific—which having been, under Providence, successfully achieved—we devoutly hope that a long life lies before him—and that he will peacefully enjoy, in whatever land he makes his home, the happiness and the honour which are usually, even in this uncertain world, the rewards of so much enterprise, genius, and virtue.

When he first came among us, a few years ago, he was but little known in his own country, not at all in ours; now his name is known all over the world. His great work was indeed a perilous undertaking for a stranger in Britain, without the patronage of powerful friends, and with no very great means of his own—all of which he embarked in the enterprise dearest to his heart. Had it failed, Audubon would have been a ruined man—and that fear must have sometimes dismally disturbed him, for he is not alone in life, and is a man of strong family affections. But happily those nearest his breast are as enthusiastic in the love of natural science as himself—and were all willing to sink or swim with the beloved husband and venerated father. He has derived all along much assistance from their talents and accomplishments—and now that one half of the illustrations is published, the list of subscribers already gives assurance of success. America may well be proud of him—and he gratefully records the kindness he has experienced from so many of her most distinguished sons. In his own fame he is just and generous to all who excel in the same studies; not a particle of jealousy is in his composition; a sin, that, alas! seems too easily to beset too many of the most gifted spirits in literature and in science; nor is the happiest genius—imaginative or intellectual—such is the frailty of poor human nature at the best—safe from the access of that dishonouring passion.

It is hardly possible in one article (we must have another) to give any thing like a general view of the contents of the delightful volume (accompanying second volume of the "Illustrations," but sold separately) now lying before us, containing 600 large and closely printed pages—and which will, of course, be soon placed in the library of every true ornithologist. But you are not required to be a good ornithologist—or, indeed, an ornithologist at all—to understand and enjoy the greater part of its contents; you need but be a lover of nature, and of nature's works. And "breathes there a man with soul so dead" as not to feel wonder and delight in the character and habits of birds, delineated by one who, better perhaps than any one else alive, understands their wondrous and delightful ways, and with affectionate enthusiasm altogether unparalleled—except in the case of that kindred spirit—Alexander Wilson—has kept a record of their sayings and doings (for they can all speak) in the heart of forests—on the bosom of prairies—and on the shores of seas? We know not which of the two is the greater observer of those beautiful mysteries—and as far as it is given us to understand them—the better expounder of the many meanings therein enveloped—the "American Woodsman"—or the "Paisley Weaver." Alike happy in their genius—but Audubon—though he, too, has had his trials—the happier—the far happier in his blameless and regulated life.

It is dismal to see Science—as it is sometimes seen—in the service of irreligion—nay, even of Atheism. It is delightful to see it, as it is always seen in Audubon and his compeers—enlightened and elevated by piety—by the felt presence, in all his works, of the Great Spirit of the Universe. He feels his vocation to be a high one, and says, "let me proceed towards the completion of a task which, with reverence be it spoken, seems to have been imposed upon me by him who called me into existence." For the acquisition of the knowledge he so passionately and devoutly loves, he tells us, with truth, that he has braved the enervating heats of the south, and the cramping colds

of the north, penetrated the tangled cane-swamp, thrid the dubious trail of the silent forest, paddled his frail canoe in the creeks of the marshy shore, and swept in his gallant bark over the swelling waves of the ocean. For sake of the living treasures, there inexhaustible, and the sweet study of their unwitnessed wonders, he loves the primeval woods of his country—the vast bays of her Atlantic coasts—her sea-gulfs and her inland lakes—and all "our mighty rivers—our thundering cataracts—our majestic mountains, rearing their snowy heads into the calm regions of the cold clear sky." He is at home in the wilderness—where ever foot of bird can wade or wing can fly. Dear to him ever branch on which bird can perch—every leaf, every flower, that ever felt feeding bill—or concealed warbling throat; and Audubon is a botanist too—and a practical one—as a hundred passages show.

"What a beautiful object, in the delightful season of spring, is our Great Laurel covered with its tufts of richly, yet delicately, coloured flowers! In imagination I am at this moment rambling along the banks of some murmuring streamlet, overshadowed by the thick foliage of this gorgeous ornament of our mountainous districts. Methinks I see the timid trout eyeing my movements from beneath his rocky covert, while the warblers and other sylvan choristers, equally fond of their wild retreats, are skipping in all the freedom of nature around me. Delightful moments have been to me these when, seated in such a place, with senses all intent, I gazed on the rosy tints of the flowers that seemed to acquire additional colouring from the golden rays of the sun, as he rode proudly over the towering mountains, drawing aside as it were the sable curtain that till now hung over the landscape, and drying up, with the gentleness of a parent towards his cherished offspring, the dewy tears that glittered on each drooping plant. Would that I could describe to you the thoughts that on such a morning have filled my whole soul; but, alas, I have not words wherewith to express the feelings of gratitude, love, and wonder that thrilled and glowed in my bosom! I must therefore content myself with requesting you to look at the blossoms of the laurel as depicted in the plate, together with two of the birds, which, in pairs, side by side, are fond of residing among its glossy and verdant foliage."

That is very beautiful—yet are there many passages even more so: because of their being embued with a still deeper spirit of delight and gratitude.

"It is to the wild regions of Labrador that you must go, kind reader, if you wish to form a personal acquaintance with the White-crowned Sparrow. There in every secluded glen opening upon the boisterous Gulf of St. Lawrence, while amazed you glance over the wilderness that extends around you, so dreary and desolate that the blood almost congeals in your veins, you meet with this interesting bird. Your body is sinking under the fatigue occasioned by your wading through beds of moss, as extraordinary for their depth, as for the brilliancy of their tints, and by the difficulties which you have encountered in forcing your way through the tangled creeping pines, so dwarfish and so stubborn, that you often find it easier to trample down their branches than to separate them so as to allow you a passage. In such a place, when you are far away from all that is dear to you, how cheering is it to hear the mellow notes of a bird, that seems as if it had been sent expressly for the purpose of relieving your mind from the heavy melancholy that bears it down! The sounds are so sweet, so refreshing, so soothing, so hope inspiring, that, as they come upon the soul in all their gentleness and joy, the tears begin to flow from your eyes, the burthen on your mind becomes lighter, your heart expands, and you experience a pure delight, produced by the invitation thus made to offer your humblest and most sincere thanks to that all-wondrous being, who has caused you to be there no doubt for the purpose of becoming better acquainted with the operations of his mighty power.

"Thus it was with me, when, some time after I had been landed on the dreary coast of Labrador, I for the first time heard the song of the White-crowned Sparrow. I could not refrain from indulging in the thought that, notwithstanding the many difficulties attending my attempts—my mission I must call it—to study God's works in this wild region, I was highly favoured. At every step new objects presented themselves, and whenever I rested, I enjoyed a delight never before experienced. Humbly and fervently did I pray for a continuation of those blessings, through which I now hoped to see my undertaking completed, and again to join my ever-dear family."

We cannot deny ourselves the delight of delighting you by one other passage of the same sweet kind—so full of all right affections—human and divine.

"One year, in the month of August, I was trudging along the shores of the Mohawk River, when night overtook me. Being little acquainted with that part of the country, I resolved to camp where I was. The evening was calm and beautiful, the sky sparkled with stars, which were reflected by the smooth waters, and the deep shade of the rocks and trees of the opposite shore fell on the bosom of the stream, while gently from afar came on the ear the muttering sound of the cataract. My little fire was soon lighted under a rock, and, spreading out my scanty stock of provisions, I reclined on my grassy couch. As I looked around on the fading features of the beautiful landscape, my heart turned towards my distant home, where my friends were doubtless wishing me, as I wished them, a happy night and peaceful slumbers. Then were heard the barkings of the watch-dog, and I tapped my faithful companion to prevent his answering them. The thoughts of my worldly mission then came over my mind, and having thanked the Creator of all for his never failing mercy, I closed my eyes, and was passing away into the world of dreaming existence, when suddenly there burst on my soul the serenade of the Rose-breasted bird, so rich, so mellow, so loud in the stillness of the night that sleep fled from my eyelids. Never did I enjoy music more: it thrilled through my heart, and surrounded me with an atmosphere of bliss. One might easily have imagined that even the Owl, charmed by such delightful music, remained reverently silent. Long after the sounds ceased did I enjoy them, and when all had again become still, I stretched out my wearied limbs, and gave myself up to the luxury of repose. In the morning I awoke vigorous as ever, and prepared to continue my journey."

From every sight he sees the ornithologist learns a lesson of humility—for there is a mystery in the wisdom that is for ever at work around him—a mystery that remains unsolvable for ever to the genius of man. Often, while gazing on the nest of a bird, has Audubon been led to question himself, why there is often so much difference in the conformation and materials of those even of the same species, in different latitudes or localities? Often, while admiring the birds themselves, has he in vain tried to discover why they

should be so distinguished by peculiar characters? Why, for example, to some small and seemingly more delicate than others, greater mental and corporeal hardihood should have been assigned, so that they are wont to force their way, and that at an early season, quite across the whole extent of the United States; while others of greater bodily magnitude, equal powers of flight, and similar courage, confine their journeys within narrow limits? Why the diminutive ruby headed Humming-bird, the delicate winter Wren, and many warblers, all birds of comparatively short flight, are seen to push their way from the West Indian Islands, or the table lands of Mexico and South America, farther north than the boundary lines, before they reach certain localities, which cannot be looked on but as the favourite places of rendezvous allotted to these beings for their summer abode? How wonderful to him that all birds which migrate are not equally privileged! Why do not the Turkey Buzzard, the Fork-tail'd Hawk, and many others possessing remarkable power and ease of flight, visit the same places? There the Vulture would find its favourite carrion during the heat of the dog-days, and the Hawk abundance of insects. Why do not the pigeons found in the south ever visit the state of Maine, when one species, the Columbia Migratoria, is permitted to ramble over the whole extent of that vast country? Why does the small Pewee go so far north, accompanied by the Tyrant Fly-catcher; while the Titirit, larger and stronger than either, remains in the Floridas and Carolinas; and the great Crested Fly-catcher seldom travels farther east than Connecticut? "Reader," quoth Audubon, "can you assist me?" How deeply enshrouded are felt to be the mysteries of nature—when thousands of years after Aristotle we hear Audubon confess his utter ignorance of what such migrations and non-migrations mean—that 'tis hard to understand why such general laws as these should be—though their benign operation is beautifully seen in the happiness provided alike for all—whether they reside in their own comparatively small localities, nor ever wish to leave them—or at stated seasons instinctively fly away over thousands of miles, to drop down and settle for a while on some spot adapted to their necessities, of which they had prescience afar off, though seemingly wafted thither like leaves upon the wind! Verily as great a mystery is that natural religion, by the theist studied in woods and on mountains and by sea-shores, as that revelation which philosophers will not believe, because they do not understand—"the blinded bigot's scorn" deriding such a state of the soul as Faith!

A delightful volume—or volumes—perhaps many—might be formed of all that has ever been said or sung of the Lark. To our own Sky-lark how many odes and hymns have been addressed—himself the noblest lyrical poet of all—"wakening by the daisy's side"—and ascending in music towards the Morning Star! Wordsworth, Shelly, and the Shepherd have all been inspired by the warbling, mellower at once and louder as the creature soars, till the sound seems to be itself alive within the rosy cloud, as if it were the spirit of the dawn that sang! The Meadow Lark, or American Starling, is another lark than our Sky-Lark—and though we never either saw or heard it, we can love it, not only for its own but for Audubon's sake.

"How could I give the history of this beautiful bird, were I not to return for a while to the spot where I have found it most abundant, and where the most frequent opportunities occurred of observing it? Then, reader, to those rich grass fields let us stray. We are not far from the sandy sea-shores of the Jerseys; the full beauties of an early spring are profusely spread around us; the glorious sun illumines the creation with a flood of golden light, as he yet lies beneath the deep; the industrious bee is yet asleep, as are the birds in bush and tree; the small wavelets break on the beach with a gentle murmur; the sky is so beautifully blue, that, on seeing it, one fancies himself near heaven; the moon is about to disappear in the distant west; the limpid dew drops hang on every leaf, bud, and blossom, each tall blade of grass bending under the weight. Anxious to view nature in her best, I lie waiting in pleasure for the next moment:—it has come; all is life and energy; the bee, the bird, the quadruped, all nature awakes into life, and every being seems moving in the light of the Divine countenance. Fervently do I praise the God who has called me into existence, and devotedly do I pursue my avocations, carefully treading on the tender grass, until I reach a seat by nature's own hand prepared, when I pause, survey, admire, and essay to apprehend all—yes, *all* around me! Delightful days of my youth, when full of strength, health, and gladness, I so often enjoyed the bliss of contemplating the beauties of creation! they are gone, never to return; but memory fondly cherishes the thoughts which they called into being, and while life remains will their memory be pleasing.

"See the Lark that arrived last evening! fully refreshed, and with a bosom overflowing with love towards her who had led him thus far, he rises from his grassy couch, and on gently whirring pinions launches into the air, in the glad hope of finding the notes of his beloved fall on his ear. Females are usually tardy at this early season. I shall not pretend to tell you why, reader; but that such is the fact, I have been fully convinced, since the very first feeling of their value was impressed on my mind. The male is still on the wing; his notes sound loud and clear as he impatiently surveys the grassy plain beneath him. His beloved is not there. His heart almost fails him, and, disappointed, he rises towards the black-walnut tree, under which, during many a summer's heat, the mowers have enjoyed both their repast and their mid-day rest. I now see him, not desponding as you might suppose, but vexed and irritated. See how he spreads his tail, how often he raises his body, how he ejaculates his surprise, and loudly calls for her whom of all things he best loves.—Ah!—there comes the dear creature; her timorous, tender notes announce her arrival. Her mate, her beloved, has felt the charm of her voice. His wings are spread, and buoyant with gladness, he flies to meet, to welcome her, anticipating all the bliss prepared for him. Would that I could interpret to you, reader, as I feel them, the many assurances of friendship, fidelity and love that at this precious moment pass from the one to the other, as they place their bills together and chatter their mutual loves!—the gentle chidings of the male for the sorrow her delay had caused him, and the sweet words she uses to calm his ardour. Alas! it were vain to attempt it. I have listened to the talk, it is true; I have witnessed all their happiness; but I cannot describe it to you. You, reader, must watch them, as I have done, if you wish to understand their language."

It is not in nature that an ornithologist should be cruel—he is most humane. Mere skin-stuffers

are not ornithologists—and we have known more than one of that tribe who would have had no scruple in strangling their own mothers, or reputed fathers. Yet if your true ornithologist cannot catch a poor dear bird alive, he must kill it—and leave you to weep for its death. There must be a few victims out of myriads of millions—and thousands and tens of thousands are few—but the ornithologist knows the seasons when death is least afflictive—he is merciful in his wisdom—for the spirit of knowledge is gentle—and "thoughts that do often lie too deep for tears" reconcile him to the fluttering and ruffled plumage blood-stained by death. 'Tis hard, for example, to be obliged to shoot a Zenaida dove! Yet a Zenaida dove must die for Audubon's Illustrations. How many has he loved in life and tenderly preserved! And how many more pigeons of all sorts, cooked in all styles, have you devoured—aye twenty for his one—you being a glutton and epicure in the same inhuman form—and he being contented at all times with the plainest fare—a sallad, perhaps, of water-cresses, plucked from a spring in the forest-glade—or a bit of pemmican, or a wafer of portable soup, melted in the pot of some squatter—and shared with the admiring children, before a drop has been permitted to touch his own abstemious lips. Hear him on the Zenaida dove.

"The impressions made on the mind in youth, are frequently stronger than those at a more advanced period of life, and are generally retained. My father often told me, that when yet a child, my first attempt at drawing was from a preserved specimen of a dove, and many times repeated to me that birds of this kind are usually remarkable for the gentleness of their disposition, and that the manner in which they prove their mutual affection, and feed their offspring, was undoubtedly intended in part to teach other beings a lesson of connubial and parental attachment. Be this as it may, hypothesis or not, I have always been especially fond of doves. The timidity and anxiety which they all manifest, on being disturbed during incubation, and the continuance of their mutual attachment for years, are distinguishing traits in their character. Who can approach a sitting dove, hear its notes of remonstrance, or feel the feeble strokes of its wings, without being sensible that he is committing a wrong act?

"The cooing of the Zenaida dove is so peculiar, that one who hears it for the first time naturally stops to ask, 'What bird is that?' A man who was once a pirate assured me that several times, while at certain wells dug in the burning shelly sands of a well-known key, which must here be nameless, the soft and melancholy cry of doves awoke in his breast feelings which had long slumbered, melted his heart to repentance, and caused him to linger at the spot in a state of mind, which he only, who compares the wretchedness of guilt within him with the happiness of former innocence, can truly feel. He said he never left the place without increased fears of futurity, associated as he was, although I believe by force, with a band of the most desperate villains that ever annoyed the navigation of the Florida coasts. So deeply moved was he by the notes of any bird, and especially by those of a dove, the only soothing sounds he ever heard during his life of horrors, that through these plaintive notes, and them alone, he was induced to escape from his vessel, abandon his turbulent companions, and return to a family deploring his absence. After paying a parting visit to those wells, and listening once more to the cooings of the Zenaida dove, he poured out his soul in supplications for mercy, and once more became what one has said to be 'the noblest work of God,' an honest man. His escape was effected amidst difficulties and dangers, but no danger seemed to him to be compared with the danger of one living in the violation of human and divine laws, and now he lives in peace in the midst of his friends.

"The Zenaida dove always places her nest on the ground, sometimes artlessly at the foot of a low bush, and so exposed that it is easily discovered by any one searching for it. Sometimes, however, it uses great discrimination, placing it between two or more tufts of grass, the tops of which it manages to bend over, so as completely to conceal it. The sand is slightly scooped out, and the nest is composed of slender dried blades of grass, matted in a circular form, and imbedded amid dry leaves and twigs. The fabric is more compact than the nest of any other pigeon with which I am acquainted, it being sufficiently solid to enable a person to carry the eggs or young in it with security. The eggs are two, pure white, and translucent. When sitting on them, or when her young are still small, this bird rarely removes from them, unless an attempt be made to catch her, which she, however, evades with great dexterity. On several occasions of this kind, I have thought that the next moment would render me the possessor of one of those doves alive. Her beautiful eye was steadily bent on mine, in which she must have discovered my intention, her body was gently made to retire sidewise to the farther edge of her nest, as my hand drew nearer to her, and just as I thought I had hold of her, off she glided with the quickness of thought, taking to wing at once. She would then alight within a few yards of me, and watch my motions with so much sorrow, that her wings drooped, and her whole frame trembled as if suffering from intense cold. Who could stand such a scene of despair? I left the mother to her eggs or offspring.

"On one occasion, however, I found two young birds of this species about half grown, which I carried off, and afterwards took to Charleston, in South Carolina, and presented to my worthy friend the Rev. John Bachman. When I robbed this nest no parent bird was near. The little ones uttered the usual lisping notes of the tribe at this age, and as I put their bills in my mouth, I discovered that they might be easily raised. They were afterwards fed from the mouth with Indian corn meal, which they received with avidity, until placed under the care of a pair of common tame pigeons, which at once fostered them."

We need not go to America for pigeons and doves, for there are fanciers in London—some of them publicans and sinners—and one whom we know well and esteem—a retired pugilist, now a schoolmaster—who can show you such a various shower of them in the sunshine, as you could in vain seek to see in the islands, that, like so many bastions, protect the shores of South Carolina, Georgia, and the Floridas. "Those spots," says Audubon, with that kindled imagination that ever attests his love of the transatlantic regions, "where, in the calm of every spring morn, the air is rendered balmy by the effluvia of thousands of flowers, each of which rivals its neighbour in the brilliancy of its hues. Stop there, kind reader, and seat yourself beneath the broadly-extended arms of the thickly-leaved evergreen oak, and at that joyous moment, when the first beams of the sun reach your eye, see the owl passing low and swiftly over the ground, in haste to reach his diurnal retreat before the increasing light render all things dim to his sight; observe the

leather-winged bat, pursuing his undulating course through the dewy air, now deflecting downwards to seize the retiring nocturnal insect, now upwards to pursue another species, as it rises to meet the genial warmth emitted by the orb of day. Listen!—for at such a moment your soul will be touched by sounds—to the soft, the mellow, the melting accents, which one might suppose inspired by nature's self, and which she has taught the ground dove to employ in conveying the expression of his love to his mate, who is listening to them with delight." We can do all this in a field behind a public-house not far from Kensington gardens. And, oh! in how many "a secret place have we leant our ears" to the cushat—in the centre of this earth's solitariness—so it seemed—though the thousand-year old yew—in which the creature coo'd its whole heart into another heart—was visible, in its blackness, among the green-oak wood, to the traveller on the other side of the glen—on the other side of Borrodale, as, with his face towards the Serene Seatore, embosomed in shadows, he left Rosthwaite the Lovely, unforgotten, behind him, or carried its image along with him, like a dream that blends with fair realities, till all the earth becomes visionary—and in an hour was looking down on Wastwater—between the side-screens of the Great Gable and Scawfell.

Ah! Audubon, thou knowest well the feathers and the flight of them all—of the passenger pigeon, that ranges over the whole of the United States, excepting, perhaps, the southernmost portion of the Floridas, and as far as Newfoundland, where it is a familiar guest—of the Carolina dove, that flies "at its own sweet will" from Louisiana to the interior of Massachusetts, but is never seen on Maine, while it sails up the Mississippi, as far as Prairie du Chien, and to the borders of Upper Canada—of the ground dove, which one meets on the lower parts of Louisiana to Cape Hatteras, and all round the coast of the Floridas, but never in the interior, as if it would not forsake the sound of the sea—of the white-headed pigeon, confined to a small domicile of some three hundred miles of the Florida Keys, and seldom, if ever, seen on the mainland, an insular bird of passage, pleased with that habitation for seven months in the year, for the other five billing and cooing in some paradise unknown—but ah! what are we to think of thee on reading that account of the murder, in which thou wast engaged as accessary before the act—of the Key-west pigeon, the brightest and most beautiful of all the tribe, and which but on one island of all ocean was ever heard to murmur pensively in the calm, or give to the wind the gladsome muscle of its wings.

"*May* 6, 1832.—When I reached the garrison, I found the sergeant waiting for me. I gave him some small shot, and we set off, not in full run, nor even at a dog-trot, but with the slowness and carefulness usually employed by a lynx or a cougar when searching for prey. We soon reached the thickets, and found it necessary to move in truth very slowly, one foot warily advanced before the other, one hand engaged in opening a passage, and presently after occupied in securing the cap on the head, in smashing some dozens of hungry musquitoes, or in drawing the sharp thorn of a cactus from a leg or foot, in securing our gun locks, or in assisting ourselves to rise after a fall, occasioned by stumbling against the projecting angle of a rock. But we pushed on, squeezed ourselves between the stubborn branches, and forced our way as well as we could, my guide, of course, having the lead. Suddenly I saw him stoop, and observing the motion of his hand, immediately followed his example. Reduced by his position to one half of his natural height, he moved more briskly, inclined to the right, then to the left, then pushed forward, and raising his piece as he stopped, immediately fired. 'I have it,' cried he. 'What?' cried I. 'The pigeon'—and he disappeared. The heat was excessive, and the brushwood here was so thick and tangled, that had not Mr. Sykes been a United States soldier, I should have looked upon him as bent on retaliating on behalf of 'the eccentric naturalist;' for, although not more than ten paces distant from me, not a glimpse of him could I obtain. After crawling to the spot, I found him smoothing the feathers of a pigeon which I had never seen, nay, the most beautiful, yet found in the United States. How I gazed on its resplendent plumage!—how I marked the expression of its rich-coloured, large and timid eye, as the poor creature was gasping its last breath! Ah, how I looked on this lovely bird! I handled it, turned it, examined its feathers and form, its bill, its legs and claws, weighed it by estimate, and after a while formed a winding sheet for it of a piece of paper. Did ever an Egyptian pharmacopolist employ more care in embalming the most illustrious of the Pharaohs, than I did in trying to preserve from injury this most beautiful of the woodland cooers!

"I never felt, nor did my companion, that our faces and hands were covered with musquitoes; and although the perspiration made my eyes smart, I was as much delighted as ever I had been on such an occasion. We traveled onward, much in the same manner, until we reached the opposite end of the island; but not another bird did we meet this day.

"As we sat near the shore, gazing on the curious light pea-green colour of the sea, I unfolded my prize, and as I now more quietly observed the brilliant changing metallic hues of its plumage, I could not refrain from exclaiming—'But who will draw it?' for the obvious difficulties of copying nature struck me as powerfully as they ever had done, and brought to my memory the following passage:—'La nature se joue du pinceau des hommes; lorsqu'on croit qu'il a atteint sa plus grande beauté, elle sourit et s'embellit encore!'"

But let us turn to take a look at some bird of prey or other, for we are getting too amiable among the sucking doves, and beginning to roar at you, as if we were one of themselves engaged in the same agreeable occupation. We should like to see a bird who was not a bird of prey. A swallow eats a fly, and a hawk eats a swallow—the swallow, with his last breath, cursing the hawk for a bird of prey, and the fly bizzing similar execrations as heartily against the eavesdropper. Few or none confine themselves rigidly to a vegetable diet. In fact it is out of their power; for in eating a raspberry they cannot pause to eject the maggot every ripe raspberry includes, whether white, yellow, or purple; and the bird that makes no bones of the stone in a plum or cherry, never dreams of spitting out the wasp. Our belief is, that these animals are the most ferocious that feed most on vegetable vivres. Witness, among men, the seven millions of the finest *pisantry* on earth, the late Anacharsis Cloots and Isaac Ritson—and the present Sir

Richard Phillips—among beasts, the late Chuney, and bulls and bears in general, whether on or in exchange—among birds, the clocking-hen, "fierce as ten furies," and that outrageous little fellow, especially if you try to tame him by putting a scarlet cloth comb on his head with corresponding wattles, the cock sparrow. Lions and tigers, jer-falcons and eagles, who live on flesh, fish, and fowl, in comparison are quakers. People are wrong in disliking, simply on the score of diet, what they choose to call birds and beasts of prey. Audubon and North know better, and are just to the very vulture, who, take our word for it, never eats carrion when he can get fresh meat, and is a much quieter character than the game-cock, who, against the day of battle, is fed in his pen on what the initiated call cock-bread, composed of the finest wheat flour, mixed with sugar candy, and other ingredients, which, for manifest reasons, shall be anonymous.

Audubon is unwilling to think ill of any bird—and says a good word for him who is popularly conceived to be the devil incarnate—the raven. Nobody, indeed, ventures to despise either of the two gentlemen in black—but Audubon and North have a positive liking to the latter—which, under favourable circumstances, might relax into friendship. We like him for the sake of his birth-places and his places of resort. "These are," says Audubon, "the mountains—the abrupt banks of rivers—the rocky shores of lakes, and the cliffs of thinly-peopled or deserted islands. It is in such places that these birds must be watched and examined, before one can judge of their natural habits as manifested amid their freedom from the dread of their most dangerous enemy, the lord of creation. There, through the clear and rarified atmospere, the raven spreads his glossy wings and tail, and as he onward sails, rises higher and higher each bold sweep that he makes, as if conscious that the nearer he approaches the sun, the more resplendent will become the tints of his plumage." He speaks with enthusiasm of "the musical inflections," (*vulgo vocatæ*—croaks), by means of which they hold converse together in their aerial amatory excursions. These musical inflections, he says, doubtless express their "pure conjugal feelings, confirmed and rendered more intense by long years of happiness in each other's society." More faithful monogamists never sailed the sky. "Till death do us part," is the close of their nuptial oath—nor were they ever known to break it. No case of crim-con ever occurred on their cliffs. Audubon is not only inclined to believe that high up in heaven they can recall the pleasing remembrance of their youthful days, and recount the events of their life, and express the pleasure they have enjoyed, (and thus far we can go along with him,) but that (and there, we fear, he lays himself open to a charge of heterodoxy,) "they perhaps conclude with humble prayer to the Author of their being for a continuation of it." However that may be, Wordsworth has not scrupled to speak "of the *pious* bird with the scarlet breast;" and why may not the raven have as deep a sense of natural religion—though he may not show it in the same way—as the robin? But hear Audubon.

"Now, their matins are over; the happy pair are seen to glide towards the earth in spiral lines; they alight on the boldest summit of a rock, so high that you can scarcely judge of their actual size; they approach each other, their bills meet, and caresses are exchanged as tender as those of the gentle turtle dove. Far beneath, wave after wave dashes in foam against the impregnable sides of the rocky tower, the very aspect of which would be terrific to almost any other creatures than the sable pair, which for years have resorted to it, to rear the dearly cherished fruits of their connubial love. Midway between them and the boiling waters, some shelving ledge conceals their eyry. To it they now betake themselves, to see what damage it has sustained from the peltings of the winter tempests. Off they fly to the distant woods for fresh materials with which to repair the breach; or on the plain they collect the hair and fur of quadrupeds; or from the sandy beach pick up the weeds that have been washed there. By degrees, the nest is enlarged and trimmed, and when every thing has been rendered clean and comfortable, the female deposits her eggs, and begins to sit upon them, while her brave and affectionate mate protects and feeds her, and at intervals takes her place.

"All around is now silent, save the hoarse murmur of the waves, or the whistling sounds produced by the flight of the water fowl travelling towards the northern regions. At length the young burst the shell, when the careful parents, after congratulating each other on the happy event, disgorge some half-macerated food, which they deposit in their tender mouths. Should the most daring adventurer of the air approach, he is attacked with fury and repelled. As the young grow up, they are urged to be careful and silent:—a single false movement might precipitate them into the abyss below; a single cry during the absence of their parents might bring upon them the remorseless claws of the swift peregrine or jer-falcon. The old birds themselves seem to improve in care, diligence, and activity, varying their course when returning to their home, and often entering it when unexpected. The young are now seen to stand on the edge of the nest; they flap their wings, and at length take courage and fly to some more commodious and not distant lodgment. Gradually they become able to follow their parents abroad, and at length search for maintenance in their company, and that of others, until the period of breeding arrives, when they separate in pairs and disperse.

"Notwithstanding all the care of the raven, his nest is invaded wherever it is found. His usefulness is forgotten, his faults are remembered and multiplied by imagination; and whenever he presents himself he is shot at, because from time immemorial ignorance, prejudice, and destructiveness, have operated on the mind of man to his detriment. Men will peril their lives to reach his nest, assisted by ropes and poles, alleging merely that he has killed one of their numerous sheep or lambs. Some say they destroy the raven because he is black; others because his croaking is unpleasant and ominous! Unfortunate truly are the young ones that are carried home to become the wretched pets of some ill-brought-up child! For my part, I admire the raven, because I see much in him calculated to excite our wonder. It is true that he may sometimes hasten the death of a half-starved sheep, or destroy a weakly lamb; he may eat the eggs of other birds, or occasionally steal from the farmer some of those which he calls his own; young fowls also afford precious morsels to himself and his progeny;—but how many sheep, lambs, and fowls, are saved through his agency! The more intelligent of our farmers are well aware that the raven destroys numberless insects, grubs, and worms; that he kills mice, moles, and rats, whenever he can find them; that he will seize the weasel, the young opossum, and the skunk; that, with the perseverance of a cat, he will watch the burrows

of foxes, and pounce on the cubs; our farmers also are fully aware that he apprises them of the wolf's prowlings around their yard, and that he never intrudes on their corn fields except to benefit them;—yes, good reader, the farmer knows all this well, but he also knows his power, and, interfere as you may, with tale of pity or of truth, the bird is a raven, and, as La Fontaine has aptly and most truly said, 'La loi du plus fort est toujours la meilleure!'"

Our admirable friend would find it more difficult, with all his eloquence, to justify the Blue Jay. Indeed, he knows the villain too well, to attempt it; yet he speaks without asperity, and with humane hesitation—at once philosophical and religious—saying "Reader! look at the plate in which are represented three individuals of this beautiful species—rogues though they be, and thieves, as I would call them—were it fit for me to pass judgment on their actions. See! how each is enjoying the fruits of his knavery, sucking the eggs which he has pilfered from the nest of some innocent dove or harmless pigeon. Who could imagine that a form so graceful, arrayed by nature in a garb so resplendent, could harbour so much mischief—that selfishness, duplicity, and malice, should form the moral accompaniments of so much physical perfection? Yet so it is; and how like beings of a much higher order, are these gay deceivers!" The Blue Jay is a Williams—we mean the murderer of the Marrs and Williamsons, and other families in the metropolis—who escaped hanging by suicide. Yet the Blue Jay was never known to have committed this latter crime. In an aviary at Charleston, he destroyed all the birds. One after another had been killed, and the rats were supposed to have been the culprits, but no crevice could be seen large enough to admit one. Then the mice were accused, and war waged against them, but still the birds continued to be killed, first the smaller then the larger, until at length the Keywest pigeons; when it was discovered that the jay, who had been raised in the aviary, was the murderer. He was taken out, and placed in a cage, with a quantity of flour, corn, and several small birds, which he had just killed; the birds he soon devoured, but the flour or corn he would not condescend to eat, and refusing every other kind of food, soon died. The wretch had manifestly been suffering under inflammation of the organ of destructiveness; and had his head been kept for five or ten minutes under water, he would have been cured of his propensity for smaller and larger birds, and Keywest pigeons, though we shall not say that after immersion he would have shown such condescension as to eat corn. While at Louisville, in Kentucky, Audubon purchased a couple of dozens of blue jays, at the rate of six cents each, which he shipped to New Orleans, and afterwards to Liverpool, "with the view of turning them out in the English woods"—an attempt unhappily frustrated—but for which, had it proved successful, the smaller and larger birds of the English woods would have had good reason to be everlastingly grateful to their benefactor.

"They were caught in common traps, baited with maize, and were brought to me one after another as soon as secured. In placing them in the large cage which I had ordered for the purpose of sending them abroad, I was surprised to see how cowardly each newly-caught bird was when introduced to his brethren, who, on being in the cage a day or two, were as gay and frolicsome as if at liberty in the woods. The new comer, on the contrary, would run into a corner, place his head almost in a perpendicular position, and remain silent and sulky, with an appearance of stupidity quite foreign to his nature. He would suffer all the rest to walk over him and trample him down, without ever changing his position. If corn or fruit was presented to him, or even placed close to his bill, he would not so much as look at it. If touched with the hand, he would cower, lie down on his side, and remain motionless. The next day, however, things were altered: he was again a jay, taking up corn, placing it between his feet, hammering it with his bill, splitting the grain, picking out the kernel, and dropping the divided husks. When the cage was filled, it was amusing to listen to their hammering; all mounted on their perch side by side, each pecking at a grain of maize, like so many blacksmiths paid by the piece. They drank a great deal, eat broken pacan nuts, grapes, dried fruits of all sorts, and especially fresh beef, of which they were extremely fond, roosted very peaceably close together, and were very pleasing pets. Now and then one would utter a cry of alarm, when instantly all would leap and fly about as if greatly concerned, making as much ado as if their most inveterate enemy had been in the midst of them. They bore the passage to Europe pretty well, and most of them reached Liverpool in good health; but a few days after their arrival, a disease, occasioned by insects adhering to every part of their body, made such progress, that some died every day. Many remedies were tried in vain, and only one individual reached London. The insects had so multiplied on it, that I immersed it in an infusion of tobacco, which, however, killed it in a few hours."

Had Mr. Jay outlived the lice, and conquered the tobacco juice, he might have met his match in the English woods. For though "truly omnivorous," he is more tyrannical than brave; and in many cases "a downright coward." The Cardinal Grosbeak, the red thrush, and the mocking bird, and many others of inferior strength, lick him in an open ring; but to be equal with them, he creeps silently to their nests, in their absence, and acts the egg-sucker. "I have seen one go its rounds from one nest to another every day, and suck the newly-laid eggs of the different birds in the neighbourhood, *with as much regularity and composure as a physician would call on his patients.*" But Audubon has also witnessed fearful retribution for its crime—"when on returning to its own home, it found its mate in the jaws of a snake, the nest upset, and the eggs all gone. I have thought more than once on such occasions that, *like all great culprits, when brought to a sense of their enormities, it evinced a strong feeling of remorse.*" More remorse, we fear, than repentance. Alas! in the woods such rueful fate often befalls the innocent! One of the finest of all the Illustrations exhibits an attack made by a black snake on the nest of the ferruginous thrush. The female bird is seemingly expiring in its coils, while her mate, and another male of the same species that has come to their assistance, are giving battle to the reptile. "Should this alliance," says Audubon, speaking of the illustration, "of noble spirits prove victorious, will it not remind you that innocence,

although beset with difficulties, may, with the aid of friendship, extricate herself with honour?" The illustration is of a scene he witnessed with his own eyes; and he tells us "that the snake was finally conquered, and a jubilee held over its carcass by a crowd of thrushes and other birds, until the woods resounded with their notes of exultation. I was happy in contributing my share to the general joy, for on taking the almost expiring bird into my hand for a few minutes, she recovered in some degree, and I restored her to her anxious mate." The mocking-bird alone, "that unrivalled vocalist," surpasses the ferruginous thrush in song. This thrush possesses scarcely any faculty of imitation, but is, we are told, a steady performer; and though it sings for hours at a time, seldom, if ever, commits errors, while repeating the beautiful lessons set to it by nature, all of which it studies for months during spring and summer. "Ah! reader," continues the gentle-hearted ornithologist, "that I could repeat to you its several cadences, all so full of sweetness and melody, that one might imagine each last thrill, as it dies on the ear, the careful lullaby of some blessed mother chanting her babe to repose."

We fear that the ferruginous thrush himself has been known to murder an occasional small bird—but mum shall be the word for sake of his song. The Canada jay is almost as bad as the blue—and on account of his carnivorous propensities is known in Maine by the name of the carrion bird. The lumberers or woodcutters of that state amuse themselves in their camp during eating hours with what they call "transporting the carrion-bird." This is done by cutting a pole eight or ten feet in length, and balancing it on the sill of their hut, the end outside the entrance being baited with a piece of flesh of any kind. Immediately on seeing the tempting morsel, the jays alight on it, and while they are busily engaged in devouring it, a woodcutter gives a smart blow to the end of the pole within the hut, which seldom fails to drive the birds high in the air, and not unfrequently kills them. This seems cruel, but it is not so. For the jays rob the lumberers' traps of their baits; and robbery in the woods of Maine is rightly a capital crime.
